

Über dieses Buch

Dies ist ein digitales Exemplar eines Buches, das seit Generationen in den Regalen der Bibliotheken aufbewahrt wurde, bevor es von Google im Rahmen eines Projekts, mit dem die Bücher dieser Welt online verfügbar gemacht werden sollen, sorgfältig gescannt wurde.

Das Buch hat das Urheberrecht überdauert und kann nun öffentlich zugänglich gemacht werden. Ein öffentlich zugängliches Buch ist ein Buch, das niemals Urheberrechten unterlag oder bei dem die Schutzfrist des Urheberrechts abgelaufen ist. Ob ein Buch öffentlich zugänglich ist, kann von Land zu Land unterschiedlich sein. Öffentlich zugängliche Bücher sind unser Tor zur Vergangenheit und stellen ein geschichtliches, kulturelles und wissenschaftliches Vermögen dar, das häufig nur schwierig zu entdecken ist.

Gebrauchsspuren, Anmerkungen und andere Randbemerkungen, die im Originalband enthalten sind, finden sich auch in dieser Datei – eine Erinnerung an die lange Reise, die das Buch vom Verleger zu einer Bibliothek und weiter zu Ihnen hinter sich gebracht hat.

Nutzungsrichtlinien

Google ist stolz, mit Bibliotheken in partnerschaftlicher Zusammenarbeit öffentlich zugängliches Material zu digitalisieren und einer breiten Masse zugänglich zu machen. Öffentlich zugängliche Bücher gehören der Öffentlichkeit, und wir sind nur ihre Hüter. Nichtsdestotrotz ist diese Arbeit kostspielig. Um diese Ressource weiterhin zur Verfügung stellen zu können, haben wir Schritte unternommen, um den Missbrauch durch kommerzielle Parteien zu verhindern. Dazu gehören technische Einschränkungen für automatisierte Abfragen.

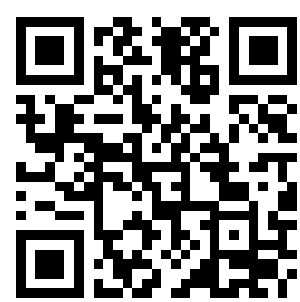
Wir bitten Sie um Einhaltung folgender Richtlinien:

+ *Nutzung der Dateien zu nichtkommerziellen Zwecken* Wir haben Google Buchsuche für Endanwender konzipiert und möchten, dass Sie diese Dateien nur für persönliche, nichtkommerzielle Zwecke verwenden.

+ *Keine automatisierten Abfragen* Senden Sie keine automatisierten Abfragen irgendwelcher Art an das Google-System. Wenn Sie Recherchen über maschinelle Übersetzung, optische Zeichenerkennung oder andere Bereiche durchführen, in denen der Zugang zu Text in großen Mengen nützlich ist, wenden Sie sich bitte an uns. Wir fördern die Nutzung des öffentlich zugänglichen Materials für diese Zwecke und können Ihnen unter Umständen helfen.

+ *Beibehaltung von Google-Markenelementen* Das "Wasserzeichen" von Google, das Sie in jeder Datei finden, ist wichtig zur Information über dieses Projekt und hilft den Anwendern weiteres Material über Google Buchsuche zu finden. Bitte entfernen Sie das Wasserzeichen nicht.

+ *Bewegen Sie sich innerhalb der Legalität* Unabhängig von Ihrem Verwendungszweck müssen Sie sich Ihrer Verantwortung bewusst sein, sicherzustellen, dass Ihre Nutzung legal ist. Gehen Sie nicht davon aus, dass ein Buch, das nach unserem Dafürhalten für Nutzer in den USA öffentlich zugänglich ist, auch für Nutzer in anderen Ländern öffentlich zugänglich ist. Ob ein Buch noch dem Urheberrecht unterliegt, ist von Land zu Land verschieden. Wir können keine Beratung leisten, ob eine bestimmte Nutzung eines bestimmten Buches gesetzlich zulässig ist. Gehen Sie nicht davon aus, dass das Erscheinen eines Buchs in Google Buchsuche bedeutet, dass es in jeder Form und überall auf der Welt verwendet werden kann. Eine Urheberrechtsverletzung kann schwerwiegende Folgen haben.



Über Google Buchsuche

Das Ziel von Google besteht darin, die weltweiten Informationen zu organisieren und allgemein nutzbar und zugänglich zu machen. Google Buchsuche hilft Lesern dabei, die Bücher dieser Welt zu entdecken, und unterstützt Autoren und Verleger dabei, neue Zielgruppen zu erreichen. Den gesamten Buchtext können Sie im Internet unter `http://books.google.com` durchsuchen.

This is a reproduction of a library book that was digitized by Google as part of an ongoing effort to preserve the information in books and make it universally accessible.

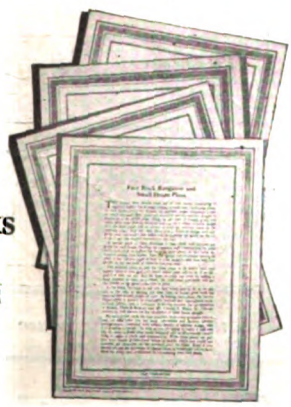
FIVE-ROOM BUNGALOW No. 510
Designed for the Service Department of
The American Face Brick Association



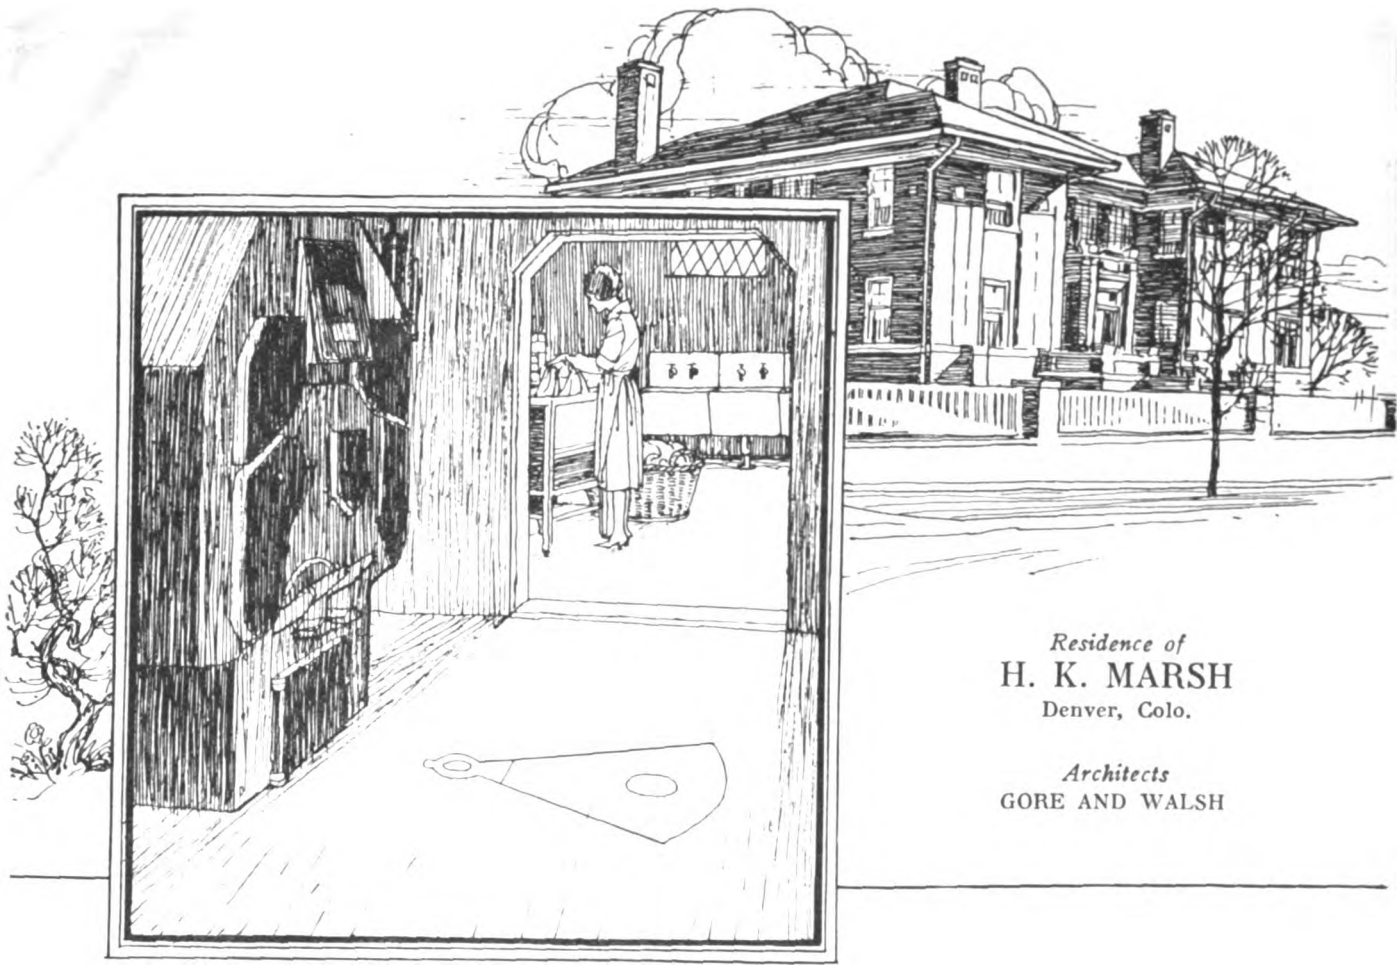
Home Designs of Exceptional Architectural Worth

IT will cost your clients no more to build an artistically designed and conveniently arranged home than one which is crude and unattractive. And it will give them infinitely greater satisfaction; will improve the neighborhood; and will be a lasting credit to the contractor.

This Association has had produced, by able and experienced architects whose talent has won recognition, a comprehensive series of worthy designs for bungalows and small houses of from three to eight rooms. These designs have been reproduced in four books, grouped so that the 3- and 4-room, 5-room, 6-room, and 7- and 8-room designs each appear in a separate book.

These houses are presented in pairs, the floor plans being reversed and the exterior designs so drawn as to fit either set of plans. Thus you have a choice of two exterior designs for each floor plan, which really gives you a selection of 184 arrangements out of the 92 designs shown. This reversal of plans for every design will enable you to locate the house most advantageously for receiving sunlight and air.

Complete working drawings and masonry material surveys can be secured at nominal prices for every design shown. The drawings show complete wall construction for solid brick, face brick or hollow tile backing, and brick veneer. This plan service, presented in the four "Face Brick Bungalows and Small House Plan" books, is a most valuable business aid which no contractor can afford to be without. Send $1, for the four books, addressing Department B-1.



Four Books of Plans $1.00

If you have not "The Story of Brick," which is free; "The Home of Beauty," showing 50 house designs, price 50c; and the "Manual of Face Brick Construction," price $1, you should ask for them, too, as they are essential to every builder

Architects
GORE AND WALSH

A Clean, Sanitary Dustless Cellar

A cellar without ash dust, ash cans, and as neat and orderly as the rest of the house is the desire of home owners.

THE SHARP ROTARY ASH RECEIVER

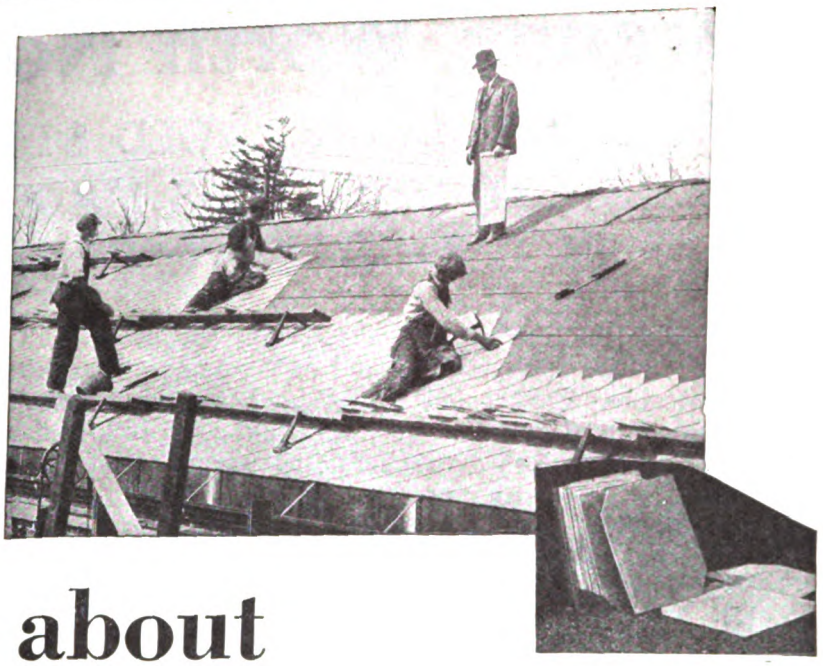
a practical home device fulfills this desire of home owners. With ash cans out of sight, ash dust eliminated, a home owner has a more spacious cellar, a cleaner cellar and a place just suited for laundry work in cold and stormy weather. Clothes can dry and never be soiled by ash dust.

Other conveniences are—no ash shovelling, a hidden Receiver for ash cans and waste material, fire protection, elimination of dust and the unpleasantness of furnace work every day.

Builders, Building Supply Dealers and Agents are invited to take up with us the matter of selling rights in your territory.

Send for a descriptive catalog.

The cellar as clean as



the rest of the house

Sharp Rotary Ash Receiver Corporation

208 Bridge Street, Springfield, Mass.

Talk about *talking* points for dealers!

Fireproof—

No paint—

No repairs—

Last forever

Keep down the high cost of upkeep

THERE are no shingles or other roofing materials in the world that have the talking points of Ambler Asbestos Shingles. They've got every desirable feature a shingle *can* have.

FIREPROOF AMBLER ASBESTOS SHINGLES

Ambler Asbestos Shingles. Made in three styles, four permanent colors, Newport grey, natural slate, red and green. Lie snug to the roof, forming water-tight and fire-tight covering.

Ambler Asbestos Building Lumber. For siding, partitions, fire doors and wherever fire resistance is essential.

Ambler Asbestos Corrugated Roofing and Siding. For industrial, railroad and farm buildings.

Ambler Linabestos Wallboard. Wherever a superior flame-proof, fire-resisting wallboard is wanted.

Send for Samples and Literature showing reproductions of installations.

ASBESTOS SHINGLE, SLATE & SHEATHING CO.
AMBLER, PENNA.

BRANCH OFFICES:—Atlanta—Boston—Buffalo—Chicago Cincinnati—Cleveland—Minneapolis—New York Philadelphia—Pittsburgh—Washington.

Distributers throughout the Country.

A Paradox Worth Noting

ROOFING TIN MARKED "OLD STYLE" DOES NOT MEAN IT IS MADE IN THE OLD STYLE

This company was the originator of the roofing tin brand of "Old Style," and for some thirty-five years our leading brand of roofing tin was known as Taylor's "Old Style" (now called "Target-and-Arrow"). We gave it the name "Old Style" because it was made by us in exactly the same old style followed by the Welsh tin plate makers in the early days of the industry when lasting quality was held in more esteem than large quantity production.

PRIOR TO 1905
Note that the device of the target and the arrow has always been a feature of our brand, even when it was known as "Old Style."

That Taylor's "Old Style" was without exception the peer of roofing tin, has been amply attested by the fact that by 1905 more than three hundred brands of tin plate had been put on the market, by other than the Taylor Company, marked "Old Style," "Old Method," "Old Process," etc., etc.

Unfortunately, our original name "Old Style" was not a name that could be registered with the U. S. Government, and therefore could be used by anyone who desired to do so.

SINCE 1905
Note the words "Old Style" have been replaced by "Target-and-Arrow" emphasizing the device of the target and the arrow shown on the original brand.

The promiscuous use of the words "Old Style" and similar designations for hundreds of brands of roofing tin has not only been confusing to Architects and Contractors, but has in many cases misled them into allowing the substitution of tin inferior to Taylor's standard, resulting in dissatisfaction on the part of property owners who thought they were getting Taylor's genuine "Old Style" roofing tin.

In order to protect our customers and to put them in a position to be *absolutely sure that our old style of hand dipped plate would be supplied when specified, we changed the brand name in 1905 from Taylor's "Old Style" to "Target-and-Arrow."*

There are many good roofing plates sold under the name "Old Style," but "Old Style" stamped on roofing tin does not guarantee that it is made in the old style manner. If you want to be absolutely sure that you are getting roofing tin made in the old style way, specify the "Target-and-Arrow" Brand.

Here's a photo of the first chuting plant designed and built by a Ransome Engineer, and used in the construction of the Illinois Central Railroad Terminal Warehouses Nos. 1, 2, 3, and 9, at New Orleans in 1909, Mr. O. M. Gwinn, Superintendent of Construction.

The size of the buildings—each is 554 feet long—presented a problem in economical handling of the concrete until a Ransome Engineer supplied the answer:

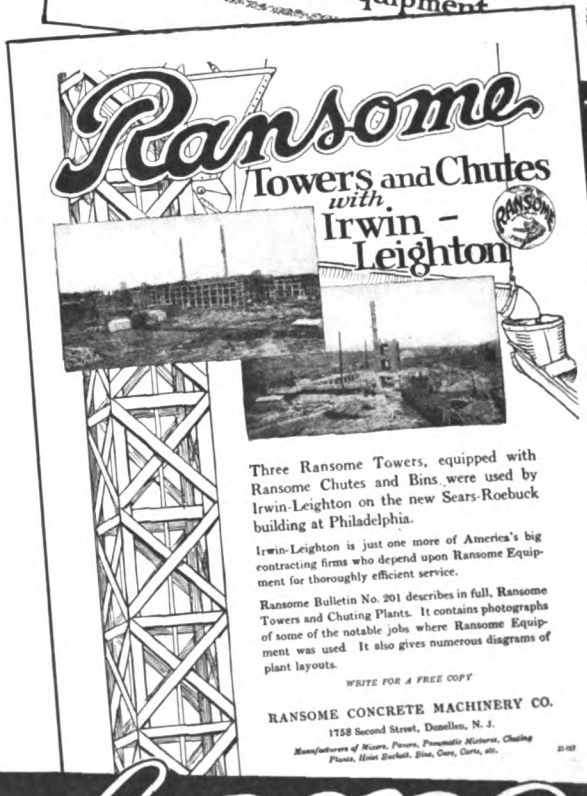
A chuting plant—Ransome, of course!

Ransome experience—covering more than 70 years—and the completeness of the Ransome line, are two things that have repeatedly saved contractors time and trouble. The quality of Ransome Concrete Machinery invariably saves its users money.

Write for Bulletin No. 201 on Ransome Chuting Plants

RANSOME CONCRETE MACHINERY CO.
Manufacturers of Mixers, Pavers, Pneumatic Mixers, Chuting Plants, Hoist Buckets, Bins, Cars, Carts, etc.
1750 Second Street, Dunellen, N. J.

BOTH the design and the material of Ransome Chuting Equipment reflect the 70 years of experience in the manufacture of Concrete Machinery that makes up Ransome's history.



Experiments have demonstrated conclusively the superiority of the shape of Ransome Chutes, not only as to the rate of flow, but, what is of equal importance, the separation. The use of High Carbon Steel affords additional resistance to abrasion, insures reduced wear, and effects a great saving in weight. Standardization, interchangeability of parts, and unit construction have been applied to all Ransome Chutes.

Send for a copy of Bulletin 201, describing Ransome Chuting equipment in detail.

OAK FLOORS

(For Everlasting Economy)

The Great High Price "Delusion"

In ads like these, in thirty-odd publications, we are constantly educating the public to the *facts* about Oak Flooring.

All agree that Oak makes the most beautiful, durable, sanitary and easy-to-clean flooring. But most people outside the building trades and professions think it is *very* expensive.

We know that, for several reasons, you would rather put up a building with Oak Floors—

A building to which you would always be proud to refer.

So we ask your co-operation in this way. When discussing floors with prospective builders, quote Oak Floors by the square foot, rather than by the thousand. Give the prospect the facts so that he can grasp them. Help us educate the public to using the *best* flooring.

With the new low prices, Oak Flooring is a true economy in any type of building, from cottage to coliseum.

Things every builder should know about SHEETROCK

Sheetrock is plaster in wallboard form.

It comes all ready for use, in broad, ceiling-high sections that any good carpenter can put up easily and quickly.

It makes rigid, smooth-surfaced, fireproof walls and ceilings, as permanent as the building itself.

It Is a Rock Product

Sheetrock is made from rock, from pure gypsum, which from time immemorial has been the finest material for plastering.

Made from rock, it will not warp or buckle. It cannot burn. It is so processed that it can be sawed and nailed like lumber.

Sheetrock Is Economical

Sheetrock saves the cost of lathing; it is nailed direct to the joists and studding. It eliminates the expense of mixing plaster.

With Sheetrock, the same type of labor—carpentering—is used throughout for building the walls. Sheetrock does away with such costly delays as waiting for the building to dry. It can be erected in any weather.

Takes Any Decoration

Sheetrock can be papered, painted or paneled. It takes wallpaper perfectly.

The USG patented reinforcement at the joining edges provides such a tight, flush joint that when Sheetrock Finisher is used with Sheetrock, it is almost impossible to detect where the sections join under the wallpaper.

Has Many Uses

Sheetrock is used in much new construction, especially in moderate-sized and moderate-priced dwellings. It is just the material for partitions in home or office. It makes non-bulging, firesafe walls and ceilings for furnace rooms, vegetable cellars and garages.

Clip and mail the coupon below for a sample of Sheetrock and our plan to help you get Sheetrock jobs.

Sheetrock is inspected and approved by The Underwriters' Laboratories, Inc.

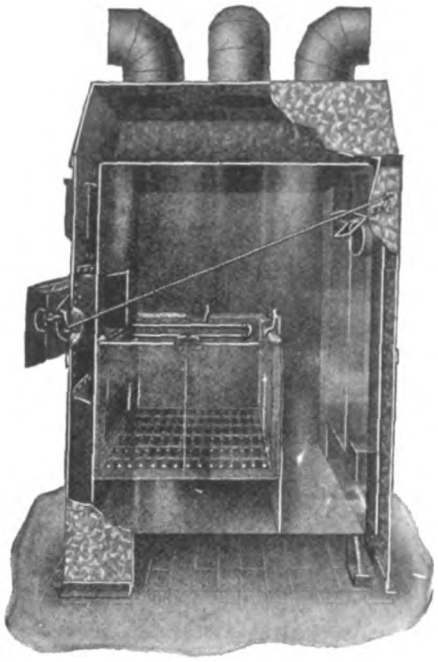
MODERN FURNACE HEATING



is the title of our illustrated booklet on this subject. It tells how to heat any house, with any furnace, in simple terms, easily understood and applied. So well is the subject treated that many copies are requested annually, for information only, where purchases of heaters are not contemplated.

Educational institutions use them for student instruction in domestic engineering. Among recent requests is the following letter from the Librarian of

COLUMBIA UNIVERSITY, NEW YORK CITY

"Gentlemen—Will you please send us ten copies of your catalog descriptive of Modern Furnace Heating, for use in our engineering classes?

"We find these very valuable, used as supplementary textbooks, and we maintain a special department in our library, where they are kept.

The Hess Welded Steel Furnace

BURNS ANYTHING—DELIVERS ALL THE HEAT

In planning a home—church—store—cottage, etc., you can do no better than to consult us in the matter of heating. Our planning and estimating facilities are yours for the asking, free, and no obligation. Send us your plans or sketches, and let us tell you how to heat the building and what it will cost. The booklet is sent free on request. Every contractor should have one.

Our Dull Season Rates—Reduced—After January 1st.

The SUPERIOR POWER CHARGER *of a* WONDER MIXER

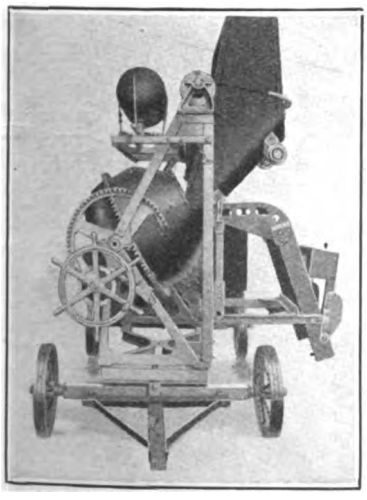
Note Its Sturdy Simplicity

Heavy angle framing built into the understructure

Oversize shaft and bearings

Folding legs — stiff when in position, relieving all strain to the superstructure, skids and axle bearings. Folds as illustrated for moving

Liberal use of batter bracing, cross members and heavy gusset plate



Efficient and accessible hoist and clutch assembly

Track design—easily extended to any depth you wish a stock pile

Showing loader—bucket removed.

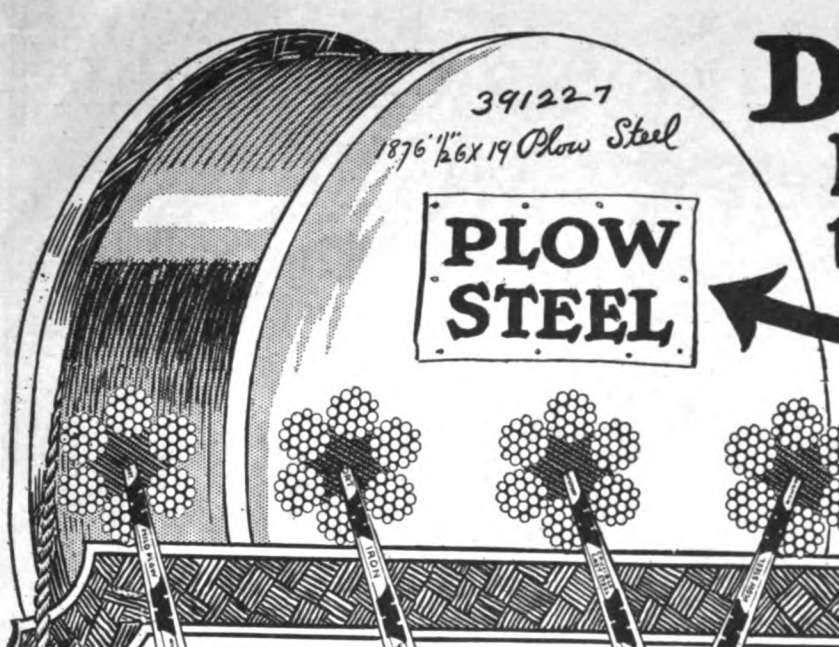
GROUND CHARGING

is possible only with a power loader. Any mixer that must be loaded from a platform is NOT a low charging one. Some platforms may be lower than others but the mixer that can be charged AT THE GROUND LEVEL is one with a LOADER.

Showing legs folded and bucket raised for moving.

The WONDER track loader saves time because the travel is so short, and because, requiring much less power, can be run faster with the same engine than other types. This gives MORE BATCHES PER HOUR allowing same time for mixing.

Ask for Catalog M-33.



Mixer raised—track extended to charge mixer on same level with material piles.

DEMAND Better evidence than this

EVERY OPERATOR who depends upon wire rope for hazardous work and every workman who risks his life with wire rope has a right to demand a more positive evidence as to the grade and make, than the tag on the rope or a mark on the reel

You'll find this protection in

WILLIAMSPORT WIRE ROPE

Not in one grade but all grades

Every foot of Williamsport rope made since November has a patented Telfax tape running clear through the hemp core, which plainly indicates each grade.

For years able engineers who have sensed the dangers from errors and substitution, often at the cost of human lives—have demanded the protection you now get from WILLIAMSPORT.

No concern who sells you wire rope has a right to expect you to take his word for its grade. Human life is too sacred to risk to careless mistakes, so easily made.

WILLIAMSPORT is a Quality product and for years the output of this mammoth plant has been absorbed by operators, whose requirements demanded uniformly high quality. Increased facilities now make available to all this famous rope with Telfax tape protection.

A handsome Telfax Color Chart and a booklet on Modern Wire Rope mailed on request.

RICHARDSON

Get your share of the roofing profits in 1922 from the sale of "Richardson Products"

START the New Year off right, make 1922 a year of real profits from your roofing business.

Sell "Richardson Products"—a complete line of quality products for any roof, anywhere.

Remember, it's worth a lot of money to any roofing dealer to have a great organization like The Richardson Company to help you build up a permanent—profitable business.

Keep in mind that to make money, year in and year out, in the roofing business, you must sell a line made by a concern that does more than fill your orders—a concern that helps you in advertising and sales co-operation, right in your own territory.

The Richardson Company controls and warrants its quality. As the basic source of supply, we are able to assure you prompt service on deliveries—we put our immense resources, our personal interest and our determination to make the best roofing, right into your business.

Capitalize These Facts

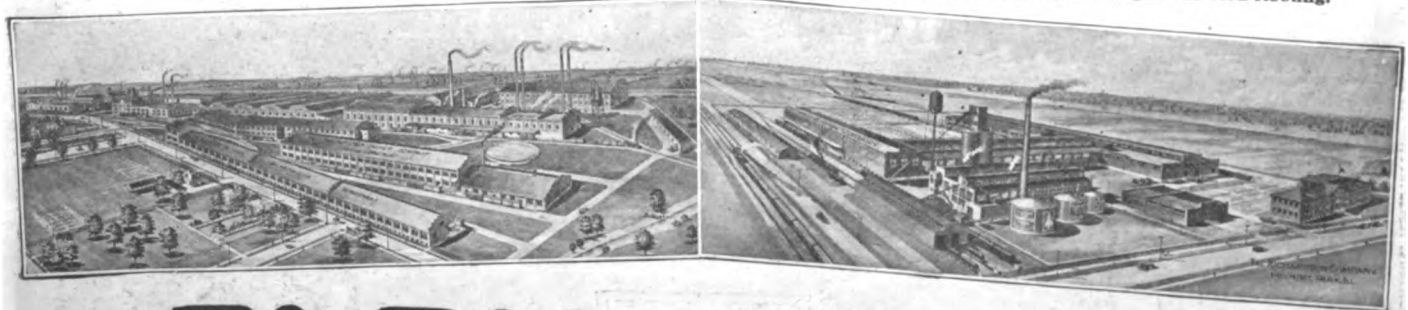
Our distribution methods assure quick action, close sources of supply and price advantages.

Look over your town. There's thousands of dollars in profits in your town which you can get if you will go out and sell

Flex-a-Tile House Tops

Shingles, Rolls or Built-On Roofing

For Any Roof — Anywhere



The 1922 building boom is going to be an opportunity of a life time in the roofing business. See that you are selling the right line in 1922—"Richardson Products."

In Old Colonial Homes

FOR the small paned windows of the colonial home the builder of today uses Andersen standard white pine window frames. Thus while achieving his architectural ideal to the last degree, he saves needless expense and delay.

Save Building Costs

Andersen standard white pine window frames save building costs. They do away with the high price of having frames made to order. They save the expense for labor; the waste of lumber; the costly delays.

These frames represent an improved idea in frame construction: to make a complete window frame at the factory, assemble its fifty-seven parts into seven main parts, and ship them in two compact bundles from which a frame can be set up in ten minutes.

They are made in eleven standard sizes, with interchangeable widths and heights to make 121 sizes of two-light window frames as needed from the wee attic window to the broad living room bay. No matter what the style of the city or farm building under construction there is a suitable Andersen Frame all ready for its windows.

Send For This Book

We have prepared for builders a book showing how Andersen window and door frames cut building costs and save delays. Upon request we will gladly send you a copy without charge.

STANLEY

BALL BEARING BUTTS

Scale: ½ size

BB239—
3½ x 3½ on a 1⅜" door of wood

DATA As a base for lasting high finish, a heavy plating of copper is deposited on polished cold rolled steel, and an additional heavy plating of finish required is placed upon copper base.

Equipped with Stanley non-detachable, weather-protected ball bearing washers. Ball tips have square shoulders flush with knuckle. Ball tip and pin are made in one piece. Pin has the Stanley non-rising and self-lubricating features. This method of lubrication prevents wear on inside of knuckles. Edges and joints are ground perfectly true. Closely fitting joints are obtained by inner edges of leaves being beveled.

Class number (BB239) is stamped upon the back of butt, at top of leaf and near joint.

Stanley Shearadized finish (designated by the letter "Z" stamped on leaf near joint) is recommended for exterior use and can be furnished in any plated finish desired.

"Three Butts will prevent the door from warping."

No. BB239 is made in the following sizes and all finishes:

2½ x 2½	4 x 4
3 x 3	4½ x 4½
3½ x 3½	5 x 5
6 x 6

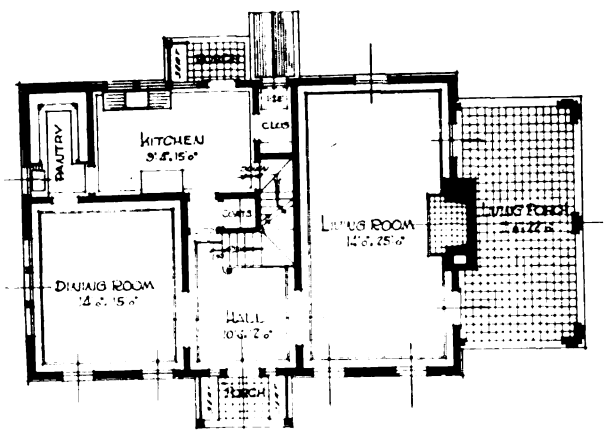
BUILDING AGE

NEW YORK, JANUARY, 1922

A Dutch Colonial Home Design

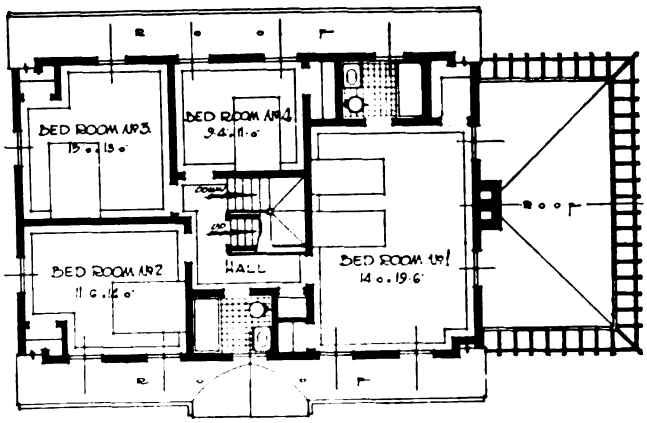
An Exceptionally Well Arranged Floor Plan Utilizing Every Foot of Space

Specially Designed for BUILDING AGE by R. C. HUNTER & BRO., Architects, New York



OUR front cover design shows a comfortable roomy house of Dutch Colonial Architecture with an appearance about it of comfort within, even though the weather is at its worst—a bleak January snow storm. In such a home as this one will surely receive that time honored greeting, "A Happy New Year," with the utmost sincerity.

One's home environment bears a direct relation to one's temperament. A comfortable, artistic home is a joy to all the occupants and they will truly appreciate it the more if they were formerly paying out a big portion of their income for an exorbitant rent in a city apartment.



In the illustration above is a sketch of the same house showing how it appears in the summer—when the flowers are in bloom and the birds are around again with their pleasant song. On the following pages the different floor plans are shown also a complete bill of the materials necessary to build this very comfortable home.

In this design the architects have succeeded in providing the maximum amount of room for the minimum

Digitized by Google

First Floor Plan

Second Floor Plan

amount of money, consistent, of course, with good architectural design; even a "box" could hardly be built for less money and at the same time give the required room.

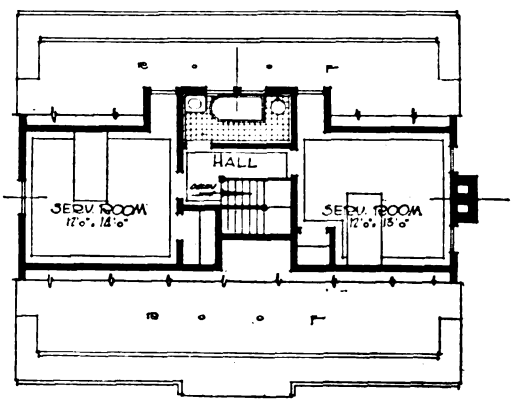
As shown on the first and second floor plans, seven rooms have been provided and the attic is of such size so that two extra rooms and a bath can be finished off if desired.

Nine rooms and three baths, with generous halls and ample closet space, all within a rectangular area of forty by twenty-six feet. Nor has anything been cramped to get this number of rooms, in fact, all of the rooms are generous in size.

One enters the house through an inviting entrance porch that has lattice covered sides which will be covered with sweet smelling honeysuckle or roses—a seat on each side is a comfortable resting place for any one making a business or short social call.

A good-sized reception hall is centrally located and the kitchen is reached direct from this so that the housewife can see both front and rear doors while in the kitchen.

The stairs are located in the center of the house where they will best serve all of the rooms with but little hall space and the stairs themselves are of the reverse flight type so that they occupy a minimum of space. The stairs continue from the cellar to the third floor with doors at the first and second floor levels. A coat closet is conveniently located under the first floor stairs. Still it is out of sight from the hall.



On the first floor the rooms are well arranged about the central hall. The living room is of generous size and the large open fireplace is a distinctive feature with French doors, leading to the porch, on either side.

This living porch is designed so that it can be easily screened for the summer and glassed in for the winter.

The entrance from dining room to kitchen is through a pantry which is provided with plenty of cupboard space for china, etc., and the small sink with window above it will be found an added convenience.

The kitchen sink is placed directly under a window so that there will be plenty of light. A closet at the other side of the kitchen affords room for the refrigerator.

A cellar is provided under the entire house with an outside entrance from the rear. Here a laundry is provided with electric outlets for washing machine and iron; also a special gas outlet for a mangle. A large cold room or pantry is arranged for besides space for heater, etc.

Attic Can Have Two Rooms and Bath

Three bed rooms and two baths are found on the second floor. The large bed room is served by a private bath, while the other bath provides for the other three rooms. All of the bed rooms have closets and a linen closet is also provided. Numerous large windows make the bed rooms bright and cheerful.

As previously mentioned two additional bed rooms and an extra bath may be finished off in the attic or third floor; the plan shows how this can be accomplished—it will be noticed that this arrangement provides an abundance of light and cross ventilation.

The exterior of the house is a pleasing adaption of the Dutch Colonial style. The walls may be finished with wide white shingles and the roof of shingles stained green. Blinds and shutters are painted a deep green.

Of course, if preferred, the exterior of this house can be stuccoed, the construction being either hollow tile or frame. In locations where stone abounds the walls could be built of this material or, if preferred, brick may be used. All would look well.

If preferred the exterior may be covered with wide clapboards or stucco. A brick chimney can be substituted for the stone if desired.

The house shown here was recently built at Tenafly, N. J.

This house would cost to build about $12,000. Complete working plans and specifications of this Dutch Colonial Home will be furnished for a nominal sum by BUILDING AGE.

Quantity Survey of Dutch Colonial Home

Shown on Preceding Pages

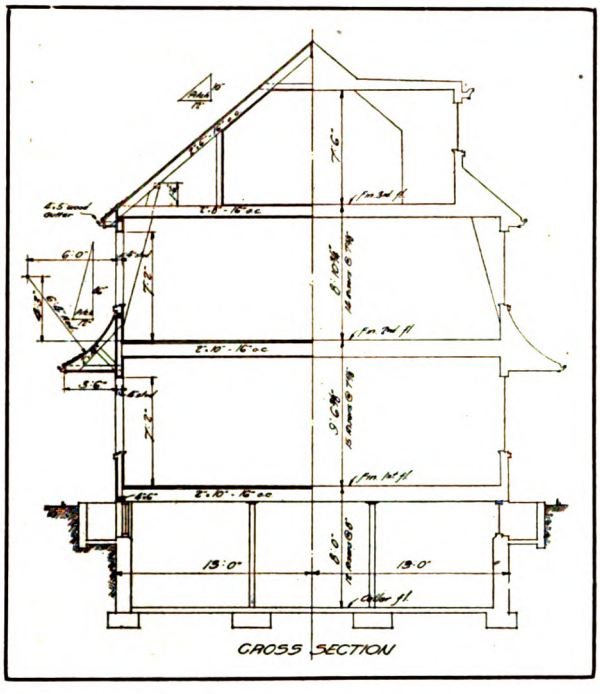
THE quantities given are for estimating. All measurements are NET unless otherwise noted; areas given for such items as sheathing, flooring, etc., are net areas to be covered, with no allowance for matching, waste, etc. Minor outs have been disregarded.

Such items as clearing site, temporary work and protection, scaffolding and general equipment and supplies, have not been included.

Such items as are marked "Unit," are to be estimated in a lump sum, following requirements of plans and specifications.

EXCAVATION

(Excavation for pipe trenches not included)



Excavation for cellar.....310 cu. yds.....
Excavation for footings..... 17 cu. yds.....

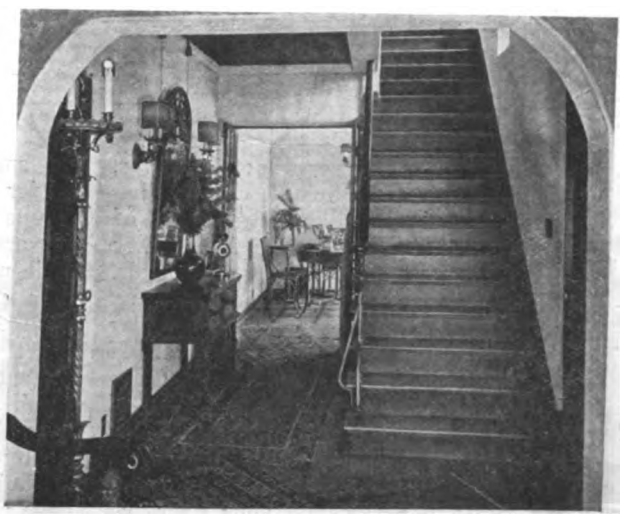
Beauty with Service

BEAUTY *vs.* SERVICE *in* BUILDING CONSTRUCTION

By JAVIER II ADRIANZEN, Architect

BUILDING AGE has been considered by me a very practical magazine except in the most practical of all things: "Design;" but the last few issues show that BUILDING AGE knows this deficiency and whether conscious, or otherwise, BUILDING AGE is steadily fixing this deficiency and not only fixing it but mastering it.

Let me come to the point: *Beauty vs. Service* has been a subject long discussed and design is no longer devoted to what many believe it to be: just the handling of things that are not essential but merely pleasing.



Beauty and its design cannot exist without service: *A thing is not serviceable if it is not beautiful.* It has not a lasting value if it is not beautiful.

Before you attempt to digest this statement consider these points:

Houses are built for human beings, not for profit, business enterprise, cleverness, etc. You may cheat a human being and do him out of the comforts and service that beauty provides, but that does not mean that you have designed a house serviceable to a human creature. You may make a successful enterprise, but by producing an ugly thing you have absolutely destroyed convenience and serviceability.

Art Without Comfort Is Not Beauty

What is beauty? Beauty, at least in the architectural sense, *is the relation of the three dimensions to a human being.* A beautiful nose for example is the one that has the three dimensions proportioned so that it will render the most efficient service to the human being. A beautiful mouth is the one that has the three dimensions so arranged that produce the best service to its owner. I can mention any number of arguments proving that a perfect mouth is very beautiful and consequently provides the owner of all its conveniences. Review in your mind all the mouths you know, all the eyes you know, all the ears you know, all the limbs you know, all the bodies you know. Imagine a fat short legged man trying to get away from a tiger in a hot sandy place. Imagine another one with legs so long that one gets in the way of the other.

Infirm Persons Need a Hand Rail All the Way Up
Art Without Service

Man has learned that if he is to survive with ease he must have things of his own so proportioned as to give him the greatest amount of service. Those that give the most satisfactory service he calls beautiful because he loves them, he prizes them, he admires them, for with them his life is a real garden of dreams.

Well, what has architectural beauty to do with all this? I may simply answer again—Houses are made for human beings to live in, and if human beings are going to live there, they do not want lack of comfort

Digitized by Google

or restriction, they want everything that will give them service and consequently comfort, and comfort is obtained by those things beautiful. Could you say that a five foot high door is comfortable? Is it beautiful? Is a two foot high desk beautiful? Ask a six footer how he would like it for his office. How do you feel in a seven foot high ceiling on a hot damp day? How would you like to walk back and forth in the kitchen in order to prepare a meal on an extremely warm evening and find also that in that kitchen you only have a two foot window perched high up about five feet from the floor? Would you like such a kitchen; would you call it beautiful? Would you call it serviceable? Would you call it well proportioned? No, it does not fit the human being and consequently is ugly and lacks serviceability.

Would you call a mustard plaster beautiful, would you call a toothache fine, would you call a sore throat charming, would you associate beauty with anything that gave you discomfort and made you irritable? If you should call all these things beautiful, you ought to live in jail.

Everything in Architecture has relation to man, be it structural, decorative or a matter of service and convenience. Ugly is what is against man. Beautiful is what pleases and gives the greatest degree of comfort to man.

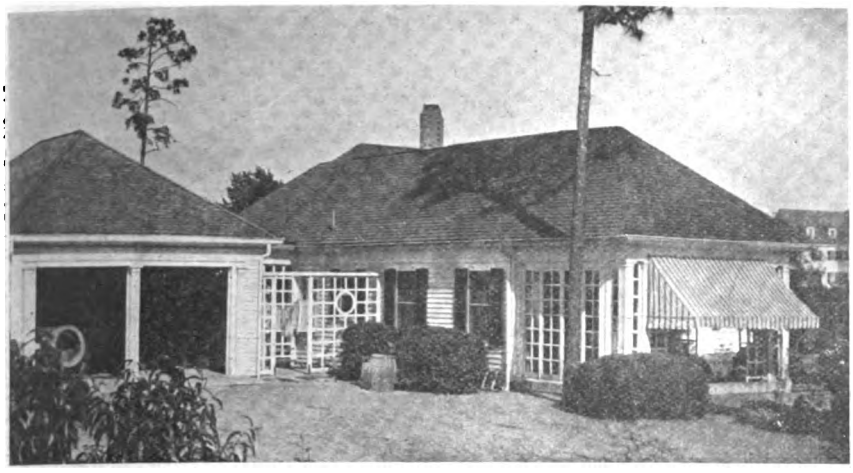
What Is a Beautiful House—What Is an Ugly One?

Would you build for yourself a beautiful house or an ugly one? Do unto others what you want others to do unto you. Do not build for others what you would not want others to build for you. This is enough, I believe, to start you thinking. Let us turn now to the houses.

The most beautiful is the cheapest house. A carpenter told me that it was all right to employ an Architect (not what the State Laws call an architect, but a real one) but *he had not the money,* so he employed a contractor and both decided on the future house. He showed me the plans, etc., and said to me "How could you build it cheaper?" I looked at the plans and my first answer was: "Why, yes, you could have built it cheaper, because you have an extra flight of stairs that you do not need; one door too many and many things to repair. Now, your wife walks 120 feet every time she wants to go to the cellar instead of walking only 20 feet. If she goes to the cellar four times a day, she walks 480 feet instead of 80 feet; in five days a week she walks 2,400 feet instead of 400 feet; besides your dining room is full of cellar dirt and smells and your floor has suffered immensely. Now, five years after its construction, you have paid about twenty times the architect's fee in extra stairs, doors, fixings, family's shoes, tired feet, etc." The Mrs. spoke and he heard the truth from her. By no means, the stairs were not beautiful, nor was the planning, etc., etc.

The average person appreciates and enjoys beauty; everybody does; but mighty few give beauty a chance to render its services and enjoy its comforts.

There is no economy in building ugly houses for they are prison places and consequently demand much money from their dwellers who get sick in sign of protest against their being deprived of beauty and comfort.



Houses Arranged in Courts Offer Service with Beauty

Who Can Decide What Beautiful Is?

WITH due respect to everybody, I do not believe the contractor, the speculator, the promoter, the builder (as he calls himself), or the *law*-made architect can see beauty, for they are not concerned with it. Funny as it may seem, so much profit to your pocket alone can never see beauty. Only the man who studies, has the inclination and the ability and hates to throw a human being into a cell and rob him of his rights to beauty and comfort can decide what beauty means. You may build what the building code allows you for they have no laws compelling beauty and comfort. Does the law of any State

Digitized by Google

Built at Southern Pines, N. C. Aymar Embury II, Architect
Garage in Harmony with House, There Is Service and Beauty

demand that the licensed architect should know what beauty is; does it demand a certain amount of studies? Many States do not even demand complete High School education; so how can they demand æsthetic education? Architecture in its pure sense is not demanded by any State, they demand practice, not quality and ability to design a beautiful and comfortable house for a human being.

The present laws are more like a *Union Law* where ability has less importance than submission and protection by-laws, and where a sort of slavery and lack of personality is the all protecting power destructive of initiative and originality.

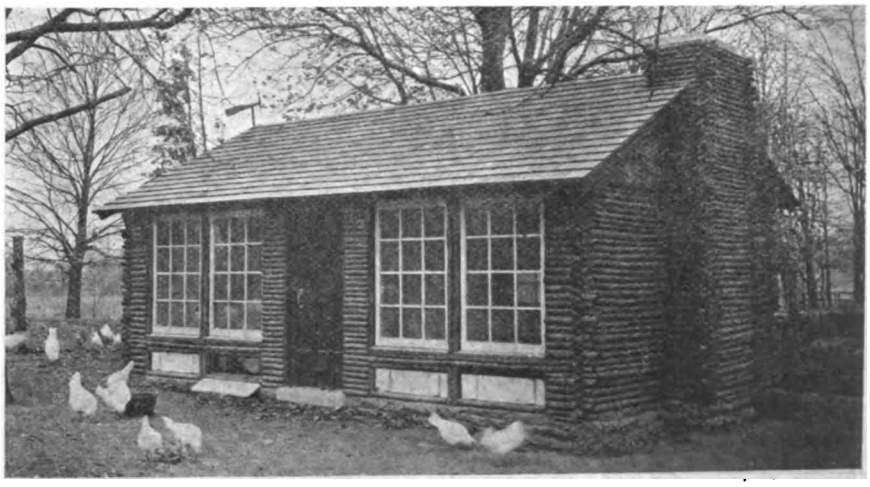
The following points at random will give an idea of beauty in architecture and its practical value:

1. Beauty has for its rule and judgment the comforts of the human being.

2. The thing that satisfies best the human being and favors him best is the cheapest.

3. What is comfortable, pleasing and serviceable to the human being is beautiful.

4. There is no money saved by torturing a human being, for the expense of overcoming the torture costs a good deal. It will not be cheaper for you to economize on a window, a beautiful door, or ventilation, it will cost you four times the saving and may be you will pay with your death for the economy ill interpreted.



5. As the people grow more and more educated, the value of ugly houses will decrease immensely. You are not wisely investing by buying cheap "automatic machine built promoter developments" of financial successes. You may pay for the successes of others but not your own.

BUILD FOR BEAUTY whenever you build and you will give the home owner something that is original, comfortable and enjoyable. It will be a house that will sell readily and one that is a good investment as it looks more than its cost.

6. All human beings are made of the same parts, head, trunk, limbs, etc. You seldom will find two human beings alike; why should the houses for the human beings be the same?

7. When you build, build for beauty, for comfort, and your house will be original; you will enjoy it and will have no difficulty in selling. Do not favor the "Cemetery of the living" Type of Architecture or a flat wall with holes like you find in the cemetery of the poor—a hole in the wall for each mortal. You are living, do so and do not allow any unscrupulous promoter to tell you that life in so many holes in the straight flat wall, penitentiary-like, is the greatest of bargains ever obtained. Have your own individuality and taste, and use the right man in helping you to realize your ideals. A doctor helps you to get well, a lawyer gets you out of difficulties (may be). The engineer builds for you that which you have no idea of realizing its possibilities. An Artist flatters you with an oil painting that you could only mess your hands and fingers with if you dared to do it. A true, real architect (not necessarily law-made) but one who knows, has studied and has the ability will help you in realizing your dreams. Reject the saving man who tells you "it is not beautiful, but can be built with the money." He knows nothing, and what he can build with that money a true architect can improve and build cheaper.

Some folks do not kick in paying big prices to promoters. I have seen some of these people charge $10,000.00 for a house that was not worth $6,000.00, and people paid it because they were fooled and did not know what they were doing. Some said they were saving on the architect. Do not be like a child, that the doctor who restores him to health is the person most feared by him.

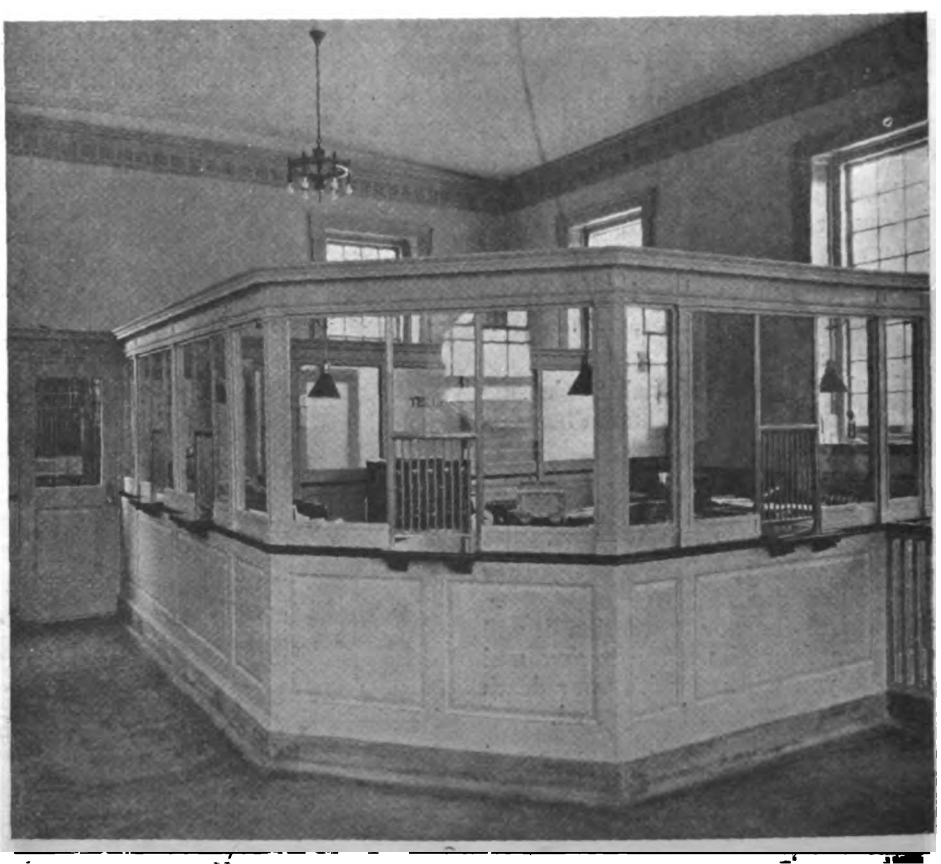
Bank of Colonial Design

The Floor Arrangement Is Convenient for Employees and Customers



PENNSYLVANIA traditions are largely Colonial, therefore it is not surprising to find modern architects and builders in that state making extensive use of what is known as Colonial architecture for various types of buildings.

The bank illustrated on this page is a dignified example of Colonial design—there is nothing costly or elaborate in its construction—just simple sound sense combined with artistic planning on the part of the architect.

This building was erected for the Huntingdon Valley Trust Co., at Lower Moreland Township, Montgomery County, Pennsylvania. The plans were prepared by Mr. Thomas B. Lippincott, architect, of Philadelphia. Fesmire Bros. were the builders.

While this building has been built of stone the walls could have been of brick or stucco without detracting from the design. Although situated in a small town its excellent arrangement and design compare favorably with many of our city banks.

The interior is dignified and business like; the dividing partitions, counters, etc., are built of wood, as shown in the interior view. Unlike some larger banks there is no bronze or marble fixtures, but the result is equally as pleasing.

BUILDERS can impress on the bankers of their community that a dignified modern home is needed for the continued prosperity of a bank.

Show how public confidence is kept by a substantial and inviting bank building. Tell them how it means perpetual publicity.

Impress upon them the duty they owe their community to be leaders in setting a standard for commercial buildings that are beautiful in design and serviceable in daily practical use.

How Investors View the Building Situation

Large Amounts of Capital Can Be Made Available for Building Purposes Under Rightful Conditions

By S. W. STRAUS
President, S. W. Straus & Co., Investment Bonds, New York

RESPONDING to your request for a statement concerning the building situation, will say that we believe the situation is improving rapidly, and we know that the public is becoming more interested in first mortgage securities.

The rapidity with which the recent $12,000,000 loan made by us to the General Motors Company, was absorbed by the public shows the potential buying power of the country in this direction, and is an indication of the large amount of capital that can be made available for building purposes under rightful conditions.

Construction work throughout the country is holding up well for this season of the year. The building of small homes is proceeding in a gratifying manner, with special activities reported in the New York district and the South. Estimates of the total of new building contracts for the year indicates that in valuation 1921 will be about equal to 1920 which was the record breaking period for the industry. On a square footage basis, however, it would appear at this time that the 1921 total will be less than 1920.

Will Construction Costs Fall or Rise?

THE most important factor at present is that of construction costs, and opinion prevails that the tendency will not be toward lower levels. It should be borne in mind that the law of supply and demand is an irrevocable factor in all economic situations. It is the final and deciding element. Various official and authentic statistics as to the amount of construction necessary to bring the building situation back to normal have been made from time to time. The most conservative of these estimates places the shortage at about $8,000,000,000. On the present annual basis of new building contracts throughout the country, (about $2,500,000,000) it would require three years of steady building to overcome this shortage even if we had no new demands, deterioration or losses. But as building work now going on is not of sufficient magnitude to make any perceptible change in the general housing status it is quite within the bounds of good judgment to conclude that we are to have a rather prolonged period of very active building.

It is contrary to experience to expect continually falling prices in the face of abnormal demands and activities. Consideration also must be given to the revival of general business in this country, and, eventually, throughout the world. A more optimistic tone, in fact, is being manifested continually.

In addition to these basic conditions, which must certainly have their effect on building costs, it is to be remembered that there are heavy burdens of taxation to be met, that great projects of public works which will demand heavy supplies of labor and materials are pending, and that there is a continued development toward better standards of living and greater conveniences, which mean higher prices.

While there will be fluctuations in building costs based on local or temporary conditions, and while there may be occasional recessions from high levels it seems contrary to the dictates of conservative judgment to withhold any worthy or well ordered building projects in the expectation of securing pronounced price reductions. We believe in the continued growth of this country and in the steady upbuilding of our great American cities, conditions which inevitably must be accompanied by heavy responsibilities and correspondingly splendid opportunities for the building industry.

MANY people desiring to build expect to finance the operation by obtaining a mortgage at four or five per cent. That day has passed. Investors simply will not sell the use of their money for less than market price. The law of supply and demand applies to safe investments as well as to other lines of business. Mr. Straus shows that there is comparatively little reluctance to invest large sums of money in mortgage bonds where the returns are adequate and the safety of the principal assured.—Editor.

Improvement in Building Situation

THAT the building situation throughout the country is improving is indicated by the steady flow of capital now being advanced for financing new operations. An example of this is shown in the announcement of S. W. Straus & Co. that within the last few days they have underwritten first mortgage serial bond issues on apartment housing accommodations involving a total valuation of approximately $10,000,000.

With regard to the general building situation, there are signs of increasing activity in the building industry, which pertains not only to the increasing volume of operations, but also to the general tone of optimism which is apparent. We note an increased volume of inquiries for capital for building operations, and there are fewer indications of a hesitant attitude by builders. The pressure for new structures of residential type is strong in all cities, and we believe that as time develops the building industry will prove an increasing factor in absorbing unemployment and stimulating the general business conditions of the country.

Reference was made above to the $12,000,000 loan on the General Motors Corporation's new Office Building at Detroit, Michigan. This building, which has just been completed, represents an investment of more than $20,000,000. It occupies an entire block 300 x 500 feet, is fifteen stories tall and is the largest office building in the world.

This loan represents one of the largest real estate mortgages ever recorded. It was offered to the public in first mortgage 7% serial bonds maturing from 1922 to 1946.

APARTMENT HOUSE FOR TWENTY-NINE FAMILIES

"Hampton Court" at Indianapolis, Ind., Provides Separate Homes for Each Tenant

APARTMENT houses are usually built with accommodations for one or more families on a floor. In some cases "duplex" apartments have been built with the rooms arranged on two floors. "Hampton Court" carries out this idea a step further by having what is practically a separate house for each tenant but with all the service that a modern apartment house provides.

Hampton Court was built from plans prepared by Messrs. George and Mac Lucas, architects of Indianapolis, Ind. It is an excellent example of making use of a deep lot.

Hampton Court consists of twenty-nine separate individual apartments, each separated by fire walls and are absolutely private, affording the tenant a feeling of security and freedom from annoyance by other tenants in the buildings.

Each house has its own private entrance door, hall and stairway, together with the usual quota of bed chambers, baths, servants' quarters, laundry, living room, dining room, butler's pantry, kitchen and sun and sleeping porches.

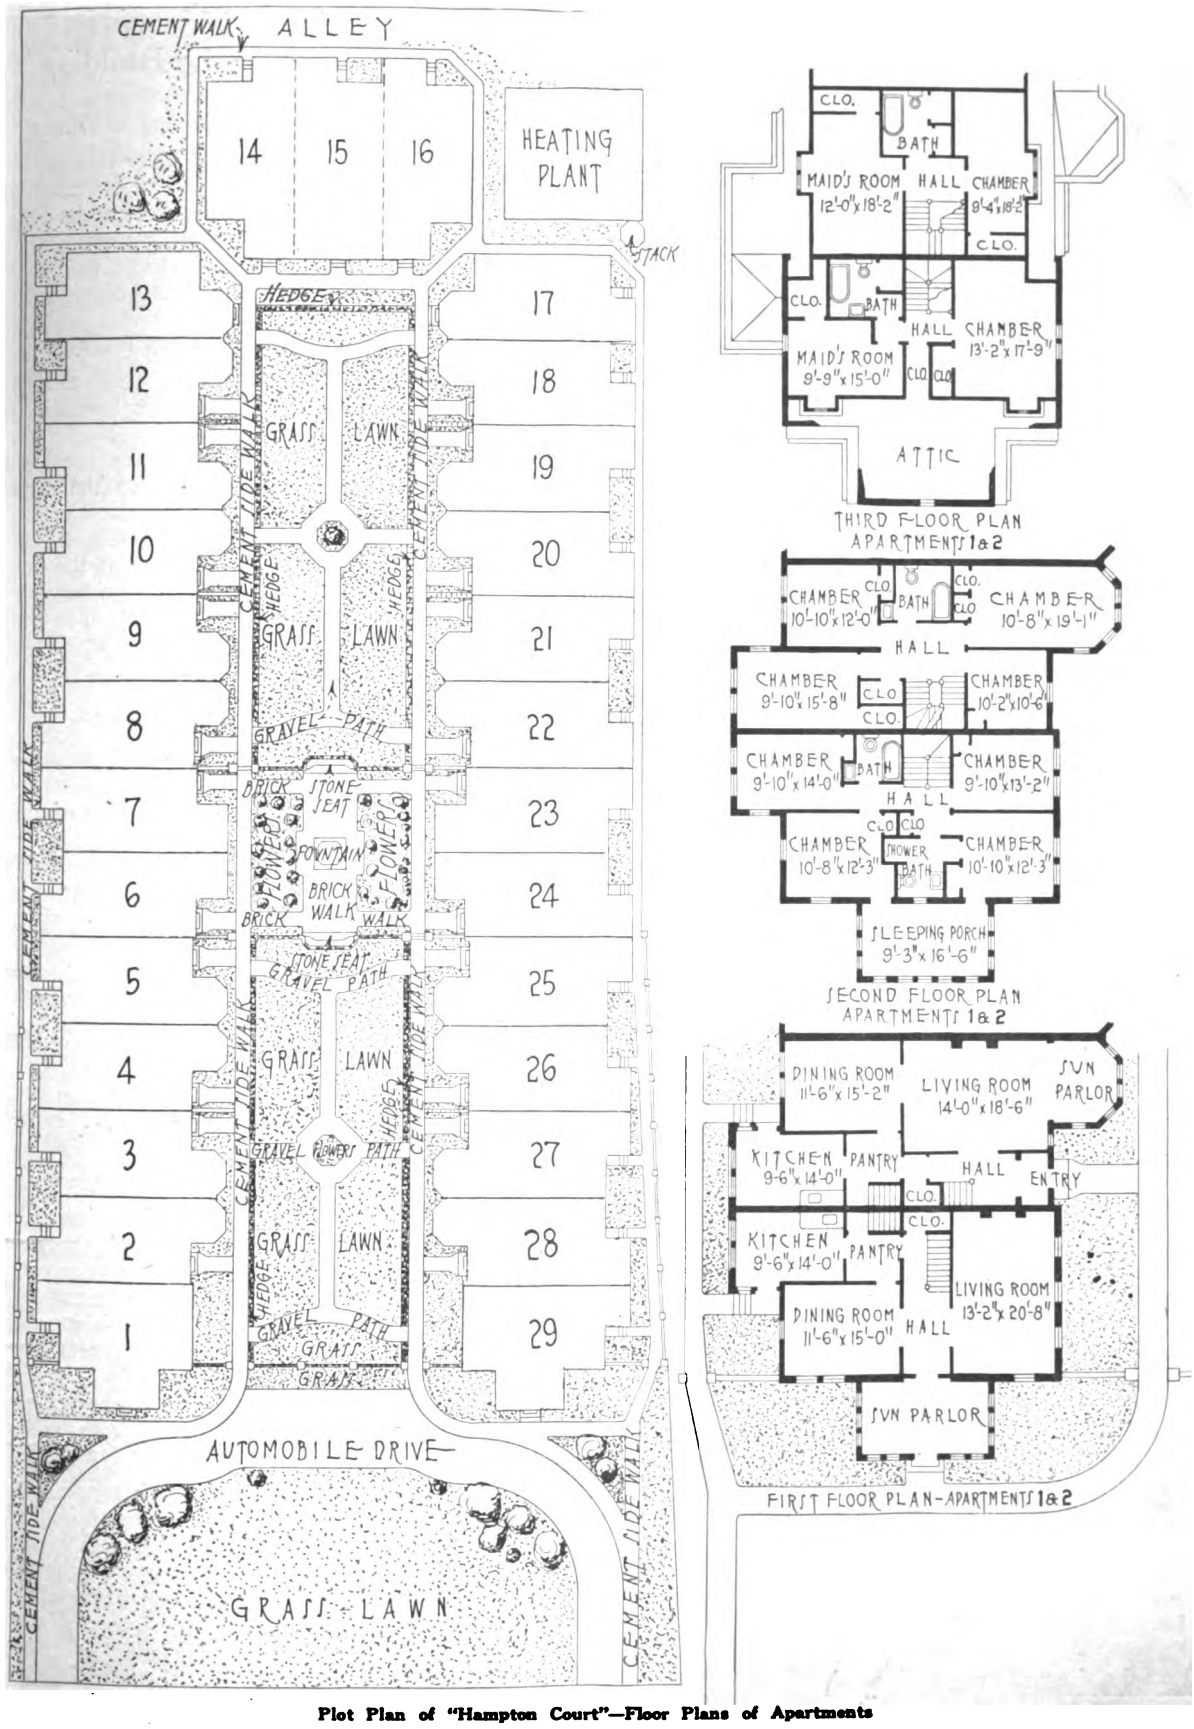
In choosing the name "Hampton Court" the architects had in mind the famous Hampton Court just outside of London, built by Cardinal Woolsey and presented to King Henry VIII with court and garden effects.

The exterior of the structures are of full range variegated mat brick. The trimmings are "terra cotta" and were furnished by the Indianapolis Terra Cotta Company of Indianapolis. The buildings have slate roofs of variegated colors.

The sun parlor walls are painted in tones of gray in Tiffany blended shades, the draperies are made with a shaped valance of beautiful linen with pea fowl and old rose gray and black ground, side draperies being in gray with black silk trimmings.

The living room is in old English and draperies are in old blue velours. The reception hall is finished in a soft tan shade, draperies are of silk in mulberry shade.

The walls of the sleeping porch are finished in gray with hangings of linen crash in the natural shades. The bed chambers are finished in gray.



The bath rooms are all finished in white enamel with tile floors and marble wainscoting. The plumbing fixtures and showers are of the very best quality.

Hampton Court has its own heating plant in a separate building; it is a two-pipe vapor job with smokeless boilers.

Suggestions for Winter Work

Modern Methods of Working Provide Twelve Months' Work to the Building Year

THERE is no good reason to "lay off" in the building business for the winter months. There is plenty of work to be done and it is strictly up to the contractors and builders to impress on the people of their community that building workers do not only desire jobs from April to November, but all the year round.

One of the benefits of the war was that it impressed on everyone the fact that building construction work could go on during winter. All of us will recall the severity of the winter of 1917-1918. Shipyards, concrete work, steel work, wood construction, etc., went right along at top speed (and top cost too) because *we had to*.

In peace time we should make use of these lessons. It is certainly uneconomical for any industry to be idle for part of the time. In the present state of our country it is the duty of everyone to find or create useful employment so that all who are willing to work may have a job.

Building Repairs Needed

Contractors can impress the fact that property maintenance presents a large field where action will benefit equally both owners and the unemployed. The preservation and repair of buildings is a growing and very important line of work and builders can talk this subject so that the public will realize that the up-keep of their property is just as important as the building of a new structure.

The best part of this is that a very large portion of the repairs and improvements can be done indoors which means that the weather has nothing to do with keeping busy. Impress on the owners that a neglect of their property means a direct loss to them and an economic loss to the whole country.

If a new factory is to be built it means a good deal financially to every one in the community to have it ready and in operation as soon as possible. Just because it is winter is no reason to wait. Get the excavation dug, material on the site and even such work as concreting can be done safely if simple precautions are taken.

Concrete Work in Cold Weather

In order to place concrete successfully in cold weather, it is necessary to be prepared to use somewhat different methods than in summer months. The fundamentals of these methods are easily comprehended by an understanding of the action of concrete in hardening.

Hardening of concrete is not a process of drying out as some may suppose, but is a chemical reaction between the cement and the water used in the mixing. Two things are necessary for the proper hardening of concrete—namely, warmth and moisture.

Many methods are used for heating aggregates. A simple method is to use a length of iron pipe, an old boiler, or any metal cylinder over which the sand, broken stone, or pebbles can be piled, and in which a fire can be built. Care must be taken to heat the fine and coarse aggregates separately in order to avoid pre-mixing them in wrong proportions.

The concrete should be kept at a temperature around 60 degrees F. for at least two days and in very cold weather for four or five days.

Steam is preferred for heating aggregates and concrete rather than stoves because it gives moist heat.

Forms should not be removed until all danger of collapse has passed. Where the slightest doubt exists at least 10 square feet of the concrete should be heated with hot water or steam to determine whether it has hardened or merely frozen.

Stucco Work

With the introduction of magnesite stucco there is no reason for "leaving the stucco job until next spring;" finish the job now. Of course if the weather is too uncomfortable for working it is another phase of the question. When a workman is frozen he can of course produce but little work.

Plastering in Winter

The use of coke salamanders and the covering of all openings will enable plastering work to be done without a stop during winter—of course the watchman must be on the job to keep the fires going.

Shop Work

In the shop, work can go right along, screens can be made, garden furniture, ornamental gates, various built-in features for the home, etc. All these will keep the shop busy. It is up to the builder to suggest to the home owners that this kind of work can be done at the best price in winter time. The modern builder must educate himself to be a better salesman so as to get this kind of profitable work.

Wall Boarding

Here is a line of work that will afford plenty of winter work. There are still a large number of unfinished attics that can be finished off cheaply and well by the use of wall board. Why not make a canvass of some of the houses in your town and suggest and show how it can be done.

By the way, don't imagine that wall board is only good for walls, there are many other uses for it and the builder can obtain some profitable work by letting people know what he can do. Wall board makes excellent screens for show windows, etc.

Painting and Decorating

Why wait until spring to have interior painting and paper hanging done? Impress on your community that it can be done best now.

Painting and varnishing done now will relieve unemployment when relief is most needed, and will save the surface of valuable property.

Winter Study

Don't forget that now is the best time for some careful faithful study—get some back issues of BUILDING AGE and a few good technical books. Go over the construction problems. Think about the jobs you have finished—was there a better and quicker way of doing the work? Apply this knowledge to new work: turn out better work and make more money.

Wiring a Home for Convenience

By G. T. HADLEY
Member, Society for Electrical Development

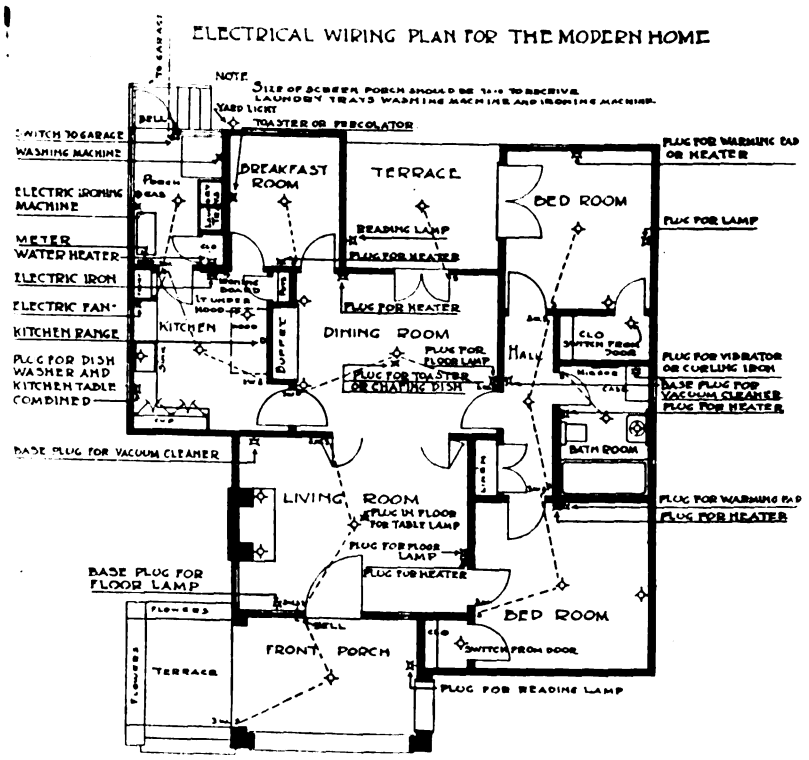
A RING of the door-bell, a snap of an electric switch and a cheery light beams out to welcome guests or new arrivals, for this is a home wired for comfort and convenience. No need to stumble over a dark threshold here, for the hall is prettily lighted and from it the guests get a glimpse of the living-room with the genial glow of an art lamp and softly-shaded lights in the dining-room. If you have ever entered such a house where the lighting is simple, effective and cheerful, you carried away with you an impression of good cheer and good taste. Two 3-way switches control the lights in the lower and upper halls; they save current besides being convenient.

In the living-room there is restful cosiness. Soft lighting from wall brackets and candelabra fixtures at the mantel make the room doubly attractive. The color of the silken shades harmonizes with the general color scheme of the room. Switches turn off the light of wall brackets when not needed. A wing chair has been drawn near the fire-place and here one may read by the light of a floor lamp connected with a "convenience outlet" in the baseboard.

Much too often, an architect or builder in trying to make the owner's money go as far as possible loses sight of the great convenience that an extra outlet can mean when this same outlet may be worth many times the few dollars it cost if included at the beginning of the building.

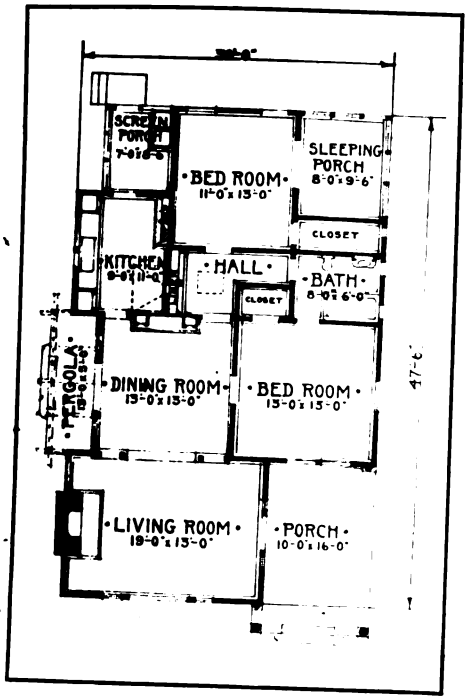
In the living-room of the home of modest type there are certain conveniences to be provided for, such as lamp for library or writing table, phonograph motor, a tea samovar, electric cleaner, electric lighting outfit for Christmas tree.

Passing into the dining-room, an electric button is pushed and the table is lighted by a modern center fixture providing a soft even illumination for the entire room, with some direct downward radiance upon the table itself. The side-board is equipped with electric candle lamps supplied with current from baseboard outlets. A similar outlet supplies the serving table containing electric chafing dish or a percolator set. In the side of the table is an outlet for the use of the hostess so that she may conveniently use table appliances, the current coming from a floor outlet. If a seamed rug is used on the floor, the cord is brought through a small slit in the seam. Two rugs in harmonious tones may be used thus leaving the space under the table free.



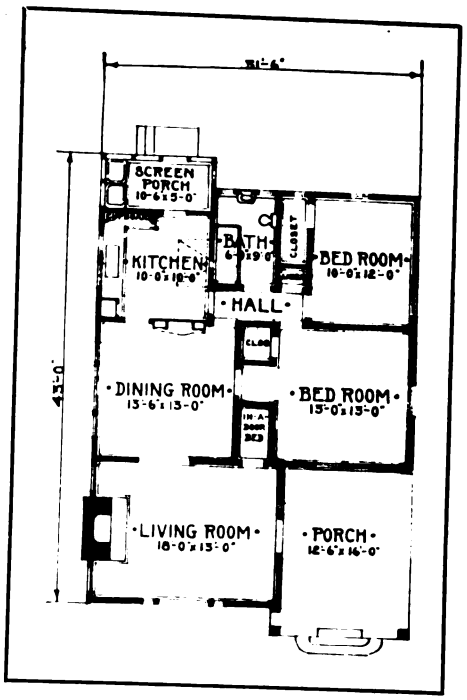
In the pantry an outlet is provided for a small motor that is useful for polishing household wares or for turning a spindle that whips or beats various mixtures, such as the making of sauces and salad dressings. A convenient outlet serves an electric dish-washer for which it is well to make provision these days. In the kitchen a special heating outlet is necessary if an electric range is to be installed; if not, it is wise to plan for the convenient use of small electric oven and electric hot plate or an electric fireless cooker which is a big labor-saver for the housekeeper.

In the laundry, a special heating outlet is required for the use of the electric iron and an outlet for the electric washer and wringer. If in the course of time there may be a big ironer for flat work, it should be planned for in the beginning. A wall bracket for light on dark days, over the ironing board should be provided.



In the garage there is no outlet in center of ceiling as the house owner does not need to light the top of his car but over the work bench is a drop light that sheds light where it is wanted or most needed. One baseboard outlet supplies current for his charging outfit, while another is conveniently placed for the electric tire pumping machine. These outlets also serve for the soldering iron, repair motor or vulcanizer.

In this home of comfort and convenience the main bedroom owes much of its charm to a silk shade deeply fringed hiding a lamp and suspended over the dressing table by a silk cord. The color of shade and cord is part of the color scheme of the room and the electric switch at the door makes the light easily available.



The heat pad and the reading lamp both give comfort when desired and a duplex outlet serves both. Other baseboard outlets serve an electric heater, or a vibrator or a curling iron. Another bedroom has a duplex outlet for use of electric cleaner or lamp or fan as the case may be. The bathroom has electric lamps on both sides of the shaving mirror and there is an outlet for the use of water heater or a bottle warmer.

Bungalow Design with Two Floor Plans

THE exterior of a house may be just what a home owner likes, but the room arrangement does not exactly meet the requirements. Likewise different styles of exteriors can be used for the same floor plans.

Two different floor plans are given for the bungalow design shown on this page—the one house has more depth than the other but this does not alter the design.

The most pronounced feature of these two practical floor layouts are the large living porches which, if so desired, can be glassed in and changed to a sun parlor.

The balance of the interior is most conveniently arranged and will make an appeal to home builders as it is adaptable to any climate. The wash tubs are shown on a screen porch but this can be closed in colder sections of the country.

The exterior can be finished in clapboards, shingle, stucco, or brick as preferred, all would carry out the design so as to make a dignified, artistic home.

REMODELING *of* LARGE OFFICE BUILDING

Interesting Description of the Unusual Alteration of One of New York City's First Skyscrapers Into Modern Office Structure

ONE of the most remarkable remodeling jobs in the building line has just been completed in New York City for the office of the International Mercantile Marine Co. They were fortunate enough to purchase the old twelve-story office building known as No. 1 Broadway which is opposite the palatial Custom House and faces Battery Park and New York Bay—a very desirable location for the office of a large steamship corporation. Other rival companies have recently built office structures in the vicinity and many of these are architectural monuments and veritable palaces of commerce.

The building on the site was too good to tear down but did not compare favorably with more recent buildings hence the plan to remodel the old building into one that had every modern improvement and of such architectural design that it would compare favorably with the buildings of other steamship companies.

The remodeling was a more difficult job than putting up a new building—the first two stories had all supporting walls and columns removed to make one large room on the first floor, besides new elevators, stairs etc., on the interior—the exterior was entirely refaced. Few would recognize it as that of the old Washington Building, known for a generation as the first sky scraper of lower Manhattan whose red brick walls and slanting coppered roof and cupola were landmarks seen from far down the harbor, across the green of Battery Park.

1881 to 1920 — Substantial Construction Lasts

The transformation of the building has been more than an outward change; it has extended to the very vitals of the structure. The building in fact has been given not only a new skin, but it has been largely rebuilt as to its frame, and done over in the main arteries of entrances, staircases and elevator shafts.

Technically the work of making over the building has presented a strong testimonial to the genius of American engineering and architectural deftness. The problem presented to the the architect, Mr. Walter B. Chambers, New York, was no ordinary one. He was under the necessity of rebuilding the structure, outside and in, without dispossessing the tenants on seven floors.

The task involved by the sweeping structural alterations in the building called for many niceties of calculation and execution. The work included extensive strengthening of foundations in some places; the entire elimination of the heavy interior frame structure of the first floor, and the incorporation of the space in that floor into the upper portion of a lofty booking office; removal of roof and tower, and the construction of two new stories in their place; removal of old elevators and construction of new, in a different place; the relocating of staircases; change in the location for the main entrances to the building, and the introduction of entirely new ventilating, heating and electrical systems.

The finished product reveals a highly successful accomplishment, as the building presents today, both in its exterior and interior, a character and tone completely at variance with the old-fashioned red brick structure from which it has emerged.

Carvings, cunningly worked into the stone, suggest the uses to which the building is put. Over the arch of the main entrance in the spandrels

Digitized by Google

and pediment, are shown Neptune, God of the Ocean, and Mercury, God of trade; above is the American eagle.

The architectural and decorative mouldings and carvings around the entrances and elsewhere are also made up of nautical suggestions, like sea shells, seaweed and star fish, while in the iron work of the elevator grilles are seen anchors and ropes, steering wheels and dolphin prows.

The distinguishing feature of the interior is the great booking office, extending the entire length of the Battery Park front of the building, from Broadway to Greenwhich Street, with a length of 160 feet and a breadth of 40 feet and ceiling 25 feet high.

THE original building was erected nearly forty years ago, and a few years later two stories were added, increasing the height to 12 stories. The construction in general was good and substantial, with a very heavy iron frame. It contained a total of six slow speed elevators, and only one stairway.

The reconstructed building is 12 stories in height, with two mezzanines and two roof pent houses, one of which contains offices. All new stories and parts have metal doors and trim. There are two separate main stairways, and eight high speed electric elevators.

To obtain unobstructed floor area and height for the booking office from the two original lower stories necessitated the removal of floors and interior columns from the basement up to second floor, the floors and columns in upper stories being supported by new steel girders and columns.

Owing to unusual conditions, the work had to be carried on according to pre-determined methods and schedules to insure uninterrupted service and convenience to tenants and, above all, absolute safety.

After preliminary surveys and soundings, work was started by excavating for the construction of new piers against the outer walls, and in the interior of the building, down to solid rock, while reinforced concrete girders were placed below the basement floor. All this was for the support of new walls and interior columns (to take the place of those ultimately to be removed in the lower stories) and by means of heavy plate girders under second floor to support the old columns above.

Cutting out floors and walls in the west or Greenwich St. wing, new framing and floor construction; installation of the new elevator shafts, stairs, toilet rooms, etc., in this wing, which had to be completed and in service before any old elevators, stairs, etc., could be discontinued.

As portions of old ground, first and second stories were vacated by tenants, these were dismantled in successive stages to make room for the new construction, meanwhile all floors from third to ninth being tenanted.

The new exterior embraced a granite base up to first floor level, and light buff Indiana limestone above. The original red brick and brown stone fronts and window jambs were cut back to receive the new stone facing, starting at the bottom and continuing upward, following immediately with the new work.

The old walls and piers being bearing and self-sustaining, with no steel skeleton, the work called for the greatest care and judgment. Fortunately they were of very good construction and ample thickness. Nevertheless a complete system of needling and shoring was installed, and other precautions were taken to provide for any possible contingency and eliminate risk.

Owing to the delicacy of the work and the unusual conditions, more than ordinary care and precautions were taken in absolutely secure and solid anchoring, bonding and backing of the new stone work to the old walls, thereby giving an even stronger and better construction than is usually found in ordinary new work.

While the work on the lower part was going on, the new work was also started at the ninth floor, in order to save time and permit work on the steel and masonry of the upper stories and roof to proceed. About the time the upper walls were completed the stone facing below had progressed up to and connected with the work

1922 — Emerging as a New Modern Building

Digitized by Google

started at ninth floor, practically completing the entire new front work at the end of 1920, with the exception of the set-back eleventh story, the stuccoed pent houses and the copper roof.

The column and girder installation had some interesting features. These included the taking out of ten old cast iron columns from the foundation up to the second floor, to provide for the main booking offices, and also the removal of one of the cross-bearing walls, necessitated by the provisions for supporting the upper structure by new construction.

Concrete piers against the exterior and court foundation walls were next installed and connected across the building, underneath the basement floor, by the reinforced concrete girders mentioned, designed to pass on each side of, and leave undisturbed, the interior column foundations, for which purpose two sides of the heavy granite base blocks of these latter were partly cut out.

On these piers and girders steel columns were erected against the exterior and court walls, extending up to the ceiling of the new booking office, with steel bolsters at top for support of large plate girders to carry the centre line of the old cast iron columns from the second floor up. The columns were solidly encased in the new brick lining of the exterior and court walls.

The plate girders consist of two single, one at each end, 56" high, 38" width of flanges and weighing about 32 tons each, and six pairs, each unit of which is 56" high, 21" flange width and weighing 17 tons, also several smaller girders of approximately 12 tons weight each.

The girders, forming pairs, were installed on each side of the old cast iron columns, against which, and resting on top of the girders, large steel shoes were placed at the second floor, connected and bolted through the columns with sixteen 1½" milled and tight fitting bolts in each direction, for the purpose of transmitting the column load, through the shoes, to the plate girders.

Steel wedges placed between the shoes and top of the plate girders were carefully driven to gradually take up the load, and when finally the entire load of the old column line had been transmitted to the girders, and these had assumed their permanent deflection, the old columns below the second floor were removed. Then, as an auxiliary to the shoe connection, and as an additional safety precaution, a steel shoe or blocking was installed and wedged up between the pair of girders, below the cast iron column, giving a direct vertical support.

The hoisting of the plate girders, which was done by means of two Yale & Towne 20 ton chain blocks hung on heavy timber movable trusses, resting on the old second story floor construction, was preceded by an elaborate system of vertical and horizontal shores, braces and tie rods to support the chain block trusses and old floor construction, and prevent any lateral movement of walls, piers and old columns.

At no time during the entire operation was a line of old columns left unbraced in any direction, except when the longitudinal brace on one side was temporarily removed to allow the girder to pass when being hoisted and then steel cable ties had been installed around the column to act in its place.

As each girder was being hoisted it was followed by a timber benching or cribbage built up at each end in such a way that should anything, despite all known precautions and safeguards, slip or give way, any sudden drop of the girder would not have been greater than a few inches.

Too much credit for this remarkable undertaking cannot be given to the men whose efforts created this huge remodeling operation. As mentioned before the architect handling this interesting commission was Walter B. Chambers. He has designed or reconstructed a number of large buildings in lower New York. The general contractors were the Whitney Company of New York, and steel construction by the Norton Company. The general direction of the job was in the hands of the International Mercantile Marine Co.'s construction superintendent, William F. Gibb.

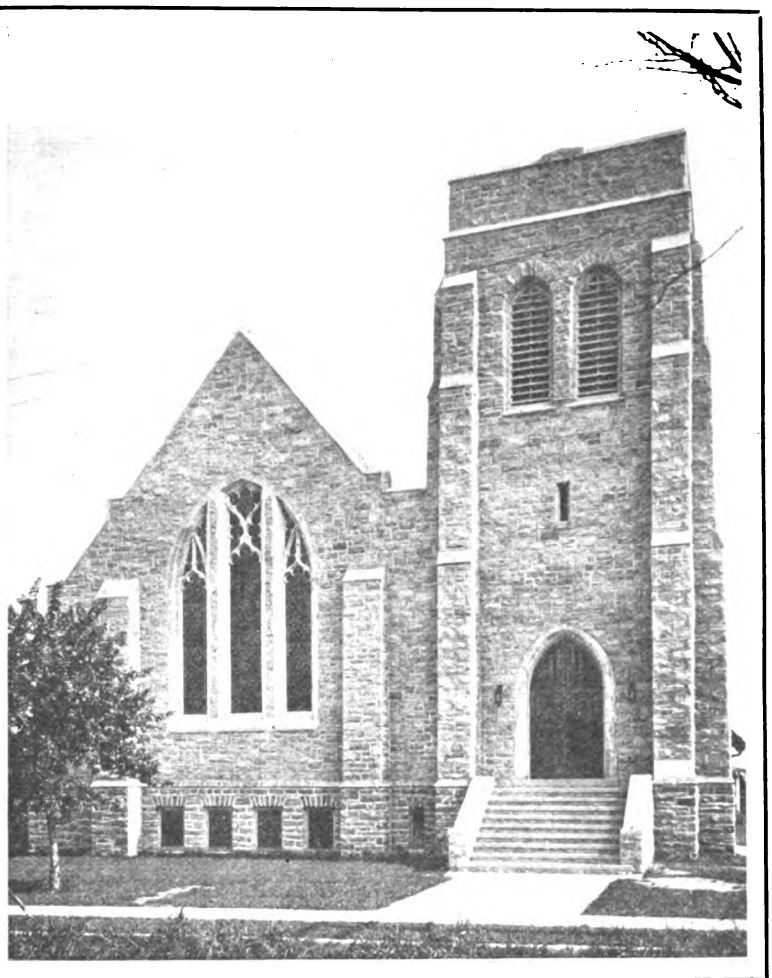
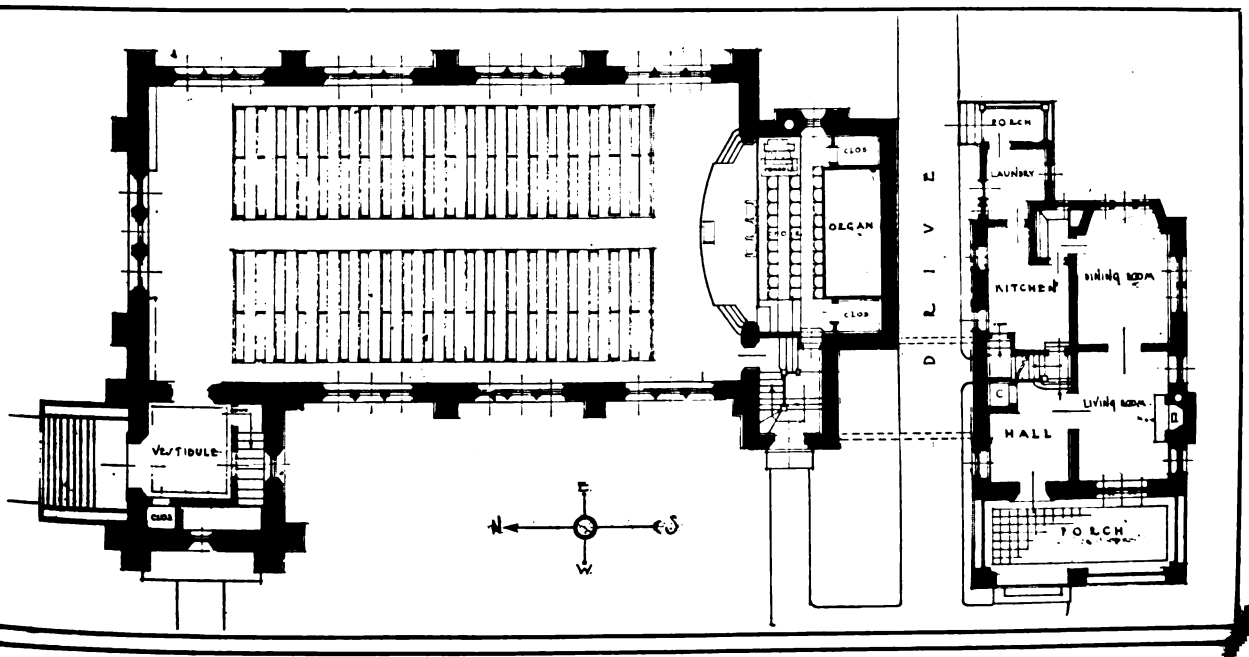
Attractive Stone Church of Gothic Design



THE church design shown here is that of the Presbyterian Church at Drexel Hill, Pa. This interesting structure was recently completed from plans prepared by Messrs. Heacock & Hokanson, Architects, of Philadelphia, and the general contractors were The Bowden Construction Co., of Philadelphia.



The walls of the church are constructed of native stone laid up in broken ashlar with trimmings of dressed limestone.

The architecture of the church is along Gothic lines; the principal features being the buttressed belfry at the corner and the Gothic mullion window of the front. This window has an unusual treatment in that the two mullions are quite wide, allowing the native stone to be used between the carved sides of each mullion.

The size of the nave or auditorium is 38 by 76 feet inside, exclusive of chancel and choir space. The pews are arranged as shown on the plan. The roof is carried by three trusses, supported by buttresses on both walls, the front and rear walls being carried up to support the purlins.

A parsonage or "manse" has been built at the rear of this church, the front facing the side street. It is built of native stone the same as the church and harmonizes with its architecture. The arrangement of the rooms of the first floor are shown below with the plan of the church.

Importance of Bracing During Construction

Simple Precautions to be Observed to Prevent Accidents

By OWEN B. MAGINNIS

ALTHOUGH nearly all qualified builders exercise care and precaution in the various operations included in construction, there are some vital details which are oftentimes either overlooked or omitted; and among these is the matter of bracing during construction.

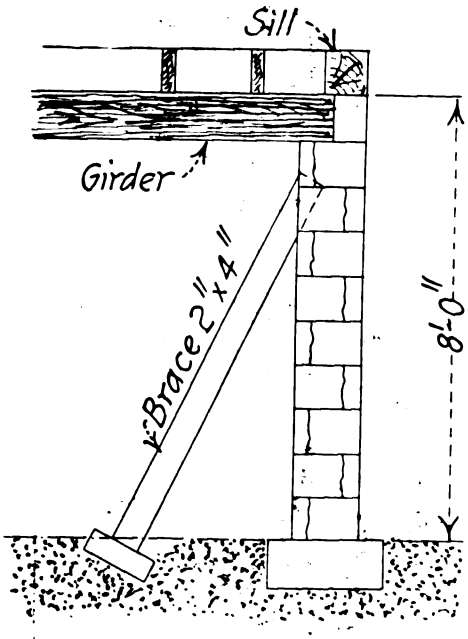

Fig. 1—How a Stone or Concrete Foundation Wall Should be Temporarily Braced

This important detail is most paramount in the erection of columns, posts, piers, frame, brick, stone, concrete walls, roofs, etc. In the sectional sketch Fig. 1, represents the proper way by which every new foundation wall should be temporarily supported and maintained until the mortar joints have hardened and set, and the structure has become sound and stable. It consists of a number of 2" x 4" spruce or hemlock joists placed and spaced about six feet apart to serve as raking shores or spur braces to preserve and keep each wall straight plumb and secure while the girders and floor beams are being set or placed in position.

Fig. 2 indicates how the same method is applied to isolated cellar piers which support the cellar girders. They should be placed at all four faces and it is the better practice to make a band of wood around each, to which each sloping brace is nailed, for it must be remembered that the slightest jarring or shock to brick, concrete block, or masonry walls and piers will break the bonds and render the structure unfit or unsafe.

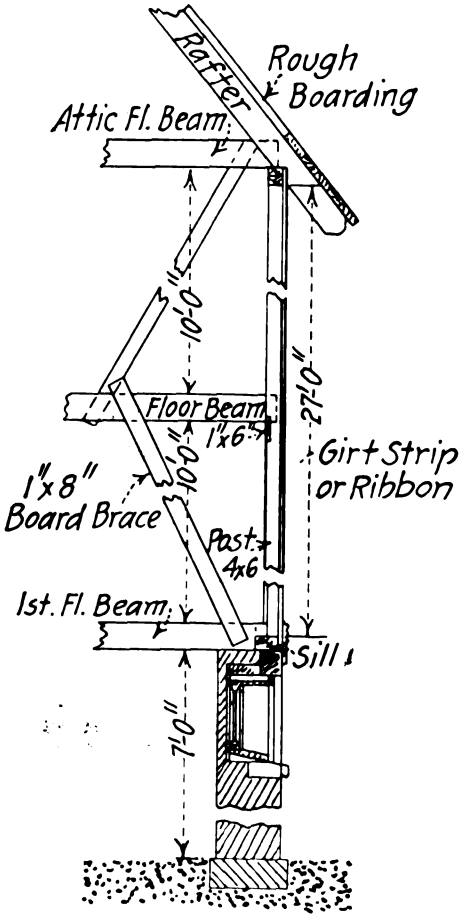

Fig. 3—How Temporary Interior Sheathing Board Braces Should be Nailed to Floor Beams as Each Tier is Placed

Coming now to the frame superstructure we note that in the cross section of a frame wall, Fig. 3, each and every tier of floor beams must be braced. I say must, advisably because the introduction of these indispensable safety measures is absolutely necessary and their omission is likely to cause failure and promote disaster or injury.

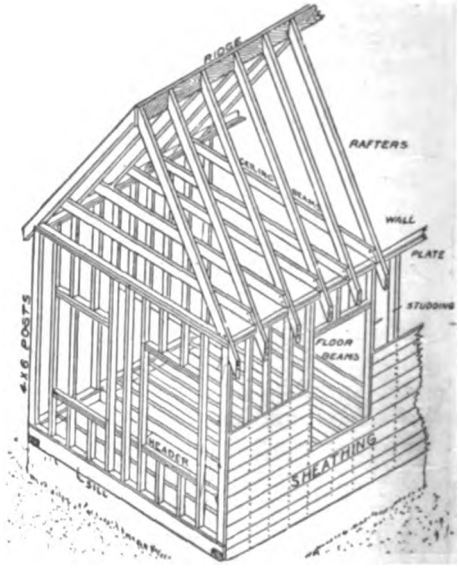

Fig. 4—Bungalow Frame Which Lacks Required Bracing

Every builder and foreman should keep in mind the fact that in a moderate wind there is a pressure of from 20 to 30 pounds per square foot acting on the structure. The vertical details, being outside of their own gravity, subjected to this force must yield, that is, fall and overturn if not temporarily supported by such excellent resisting agents as the braces here placed and nailed. They should be inserted at every sixth or eighth beam and reversed at each story in the manner indicated in Fig. 3 and again should the house be wide they can be crossed so as to form, as it were, an X, Fig. 5, thus resisting in both directions. There is nothing more dangerous in raising the frames

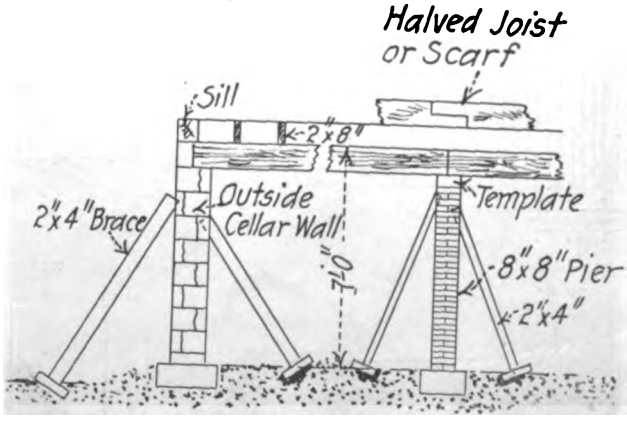

Fig. 2—How Foundations, Piers and Walls Should be Temporarily Braced While Green or Until Mortar Has Set

Digitized by Google

of timber houses than this lateral movement and its only preventive is diagonal bracing.

All braces should have a slope of not less than 60 degrees and be of good sound unbreakable boards or joists well nailed so as to be safe and reliable. During the past summer many new frame houses were pushed over out of plumb and strained through lack of sufficient bracing, which was caused by the heavy gales

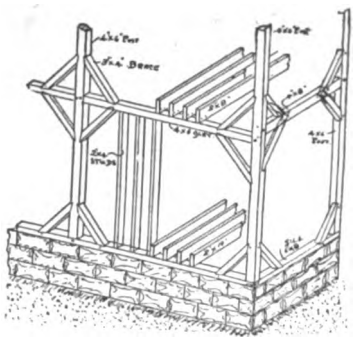

Fig. 8—Braced Angles or Corners, so as to Give Clear Passageway

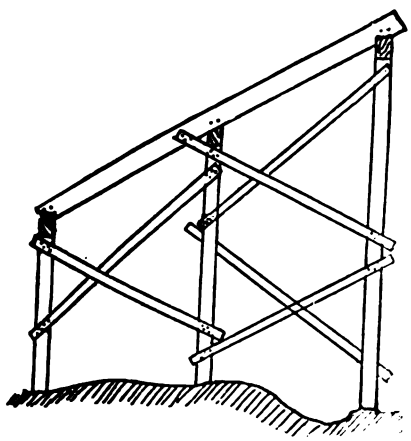

Fig. 6—How Reviewing Stands, Advertising Signs and Such Like May Be Safely Braced

and squalls which invariably accompany thunderstorms, cloud-bursts and the like. Again the strain and vibration of mechanics working on the posts, floor beams, etc., is always going on so that bracing, unless it is in itself inherent in and a constituent part of each wall and partition, must be used.

In the frame of a little bungalow shown in Fig. 4, we note the lack of bracing which might be done in the criss-cross fashion shown in Fig. 5, but this defect can easily be remedied by nailing on the sheathing diagonally or from corner to corner instead of horizontally as shown. Again the rafters ought to have at least some collar beams as in Fig. 5. Still further, such a frame as this could be made very stable by sloping studs at the corner posts.

For all such structures as Platforms or Band Stands permanent or temporary, Reviewing Stands, Advertising Signs, or others exposed to strain, pressure or weight, "diagonal" bracing is the most adaptable and essential as represented in Fig. 6, and 7 two sketches which are self-explanatory.

Let the lesson of the fallen building impress builders and mechanics on the job to the need of proper support and bracing during building construction. An ordinary wind storm is no excuse for a blown down framework, wall, etc.

The principle of all good bracing is that the shape of a triangle cannot be altered by any pressure applied at its corners. A rectangle, however, will be altered to a rhomboid by any pressure applied at its corners.

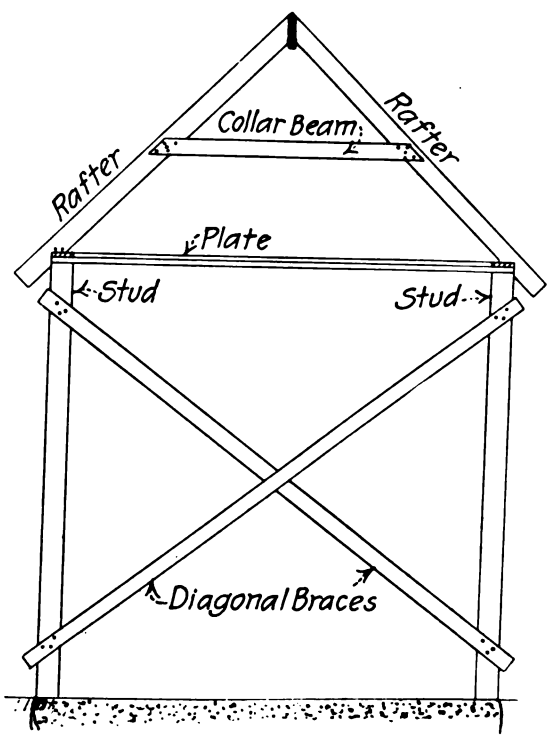

Fig. 5—Temporary D[illegible] Inserted to Prevent Movement Before Sheathing and Inside Partitions Are Set

This can be easily proved experimentally and will be more instructive. Make a rectangular frame of thin lumber and fasten the corners with one nail only and make a similar one of triangular shape. Now apply pressure to each—the rectangle will collapse while the triangle will not, unless the material itself breaks.

If a few nails are applied to the corners it will take more pressure to make the frame collapse. Staggered nailing makes small diagonal braces.

Diagonal braces make triangles and that is why they are so effective. Look

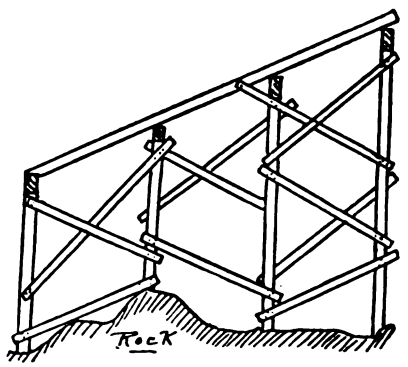

Fig. 7—Another Example of Safe Bracing for a Reviewing Stand

at any large bridge or roof—it is usually of lattice construction because it will safely support the load with the least amount of structural material.

For sheds and side walks in towns and cities we must brace the upper angles by the method given in Fig. 8, although the mortise and tenon can be adequately replaced by heavy plank braces spiked to the cross beams. All heavy posts, columns, piers, etc., must be braced after being set up plumb, and in proper position to preserve their equilibrium, balance and so on, with each and every vertical detail in building construction and engineering works.

The above is written to draw attention to, and impress upon those practical readers the importance of this part of building procedure in order that the work may go on rapidly and successfully, with safety and free from possible danger to life or limb and to a completion of permanent security and satisfaction.

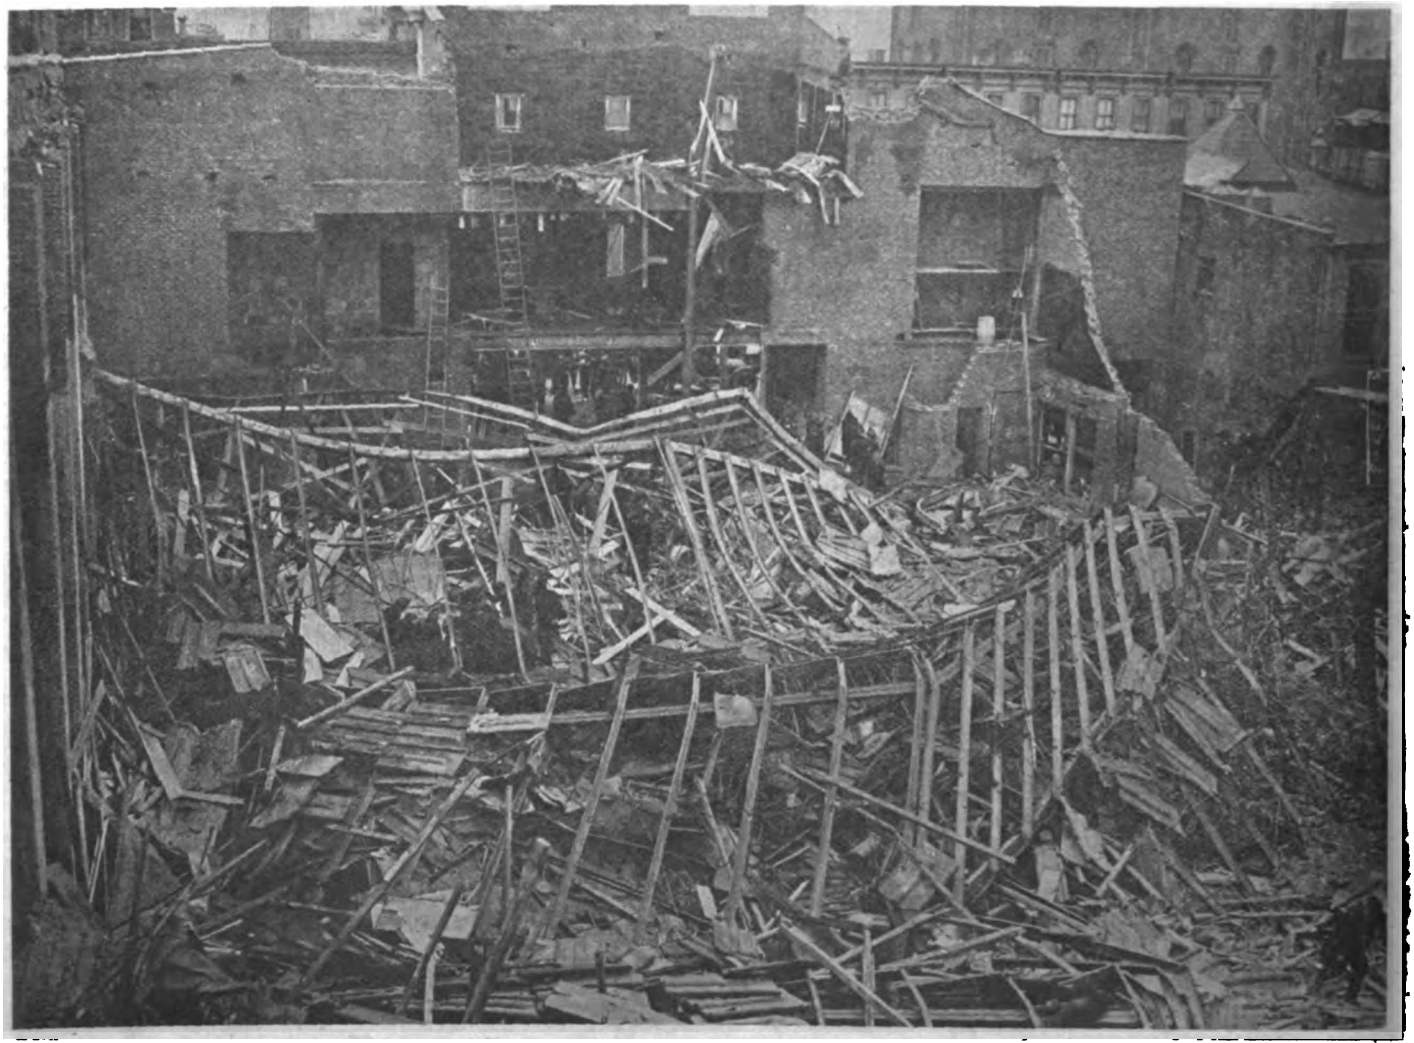
COLLAPSE *of* THEATRE DURING CONSTRUCTION

Lack of Proper Knowledge and Precaution Leads to Disaster. Impressive Object Lesson on the Value of Intelligent Supervision and Good Construction

WHEN a building collapses during its construction it is quite evident that there is something materially wrong with the methods used in its construction. It seems inconceivable that a large structure, the plans of which were prepared by a well-known theatre architect, passed by one of the most rigid building departments, and erected under the constant supervision of experienced building inspectors, should develop such weakness as to collapse before it is finished.



And this is just what happened in the most unfortunate collapse of the new American Theatre, which was nearing completion, on Bedford avenue, Brooklyn Borough, of New York City. This theatre was to have a seating capacity of 1800 people. The work had progressed to the lathing. It was of course to be a fireproof structure and the metal lathers were at work on the interior scaffolding, putting up the ceiling which was hung from the trusses.

The collapse occurred at a little after 1 P. M. on Tuesday, November 29th. It came practically without warning and the unfortunate workmen were trapped in the tangled mass of scaffolding, steel work and brick.

Our photographer reached the scene of disaster a few hours after the collapse, and while the firemen were still at work trying to rescue some of the victims. Seven workmen, including one of the sub-contractors, were killed, and at least twenty others received more or less serious injuries, while many had almost miraculous escapes. There were about fifty men at work in the building when the collapse occurred.

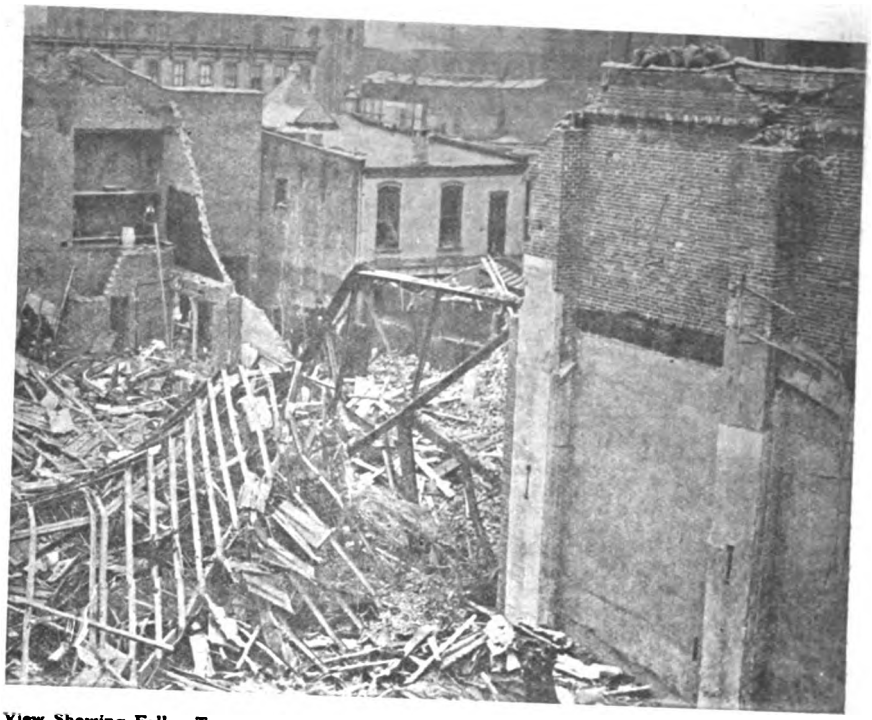
One of the fortunate ones told the writer how he and a fellow workman escaped to the street amid the falling bricks and steel work; his young buddy was so frightened after escaping with his life, that he kept running and a passing automobile knocked him down and ran over him, breaking one leg.

Bad as the collapse was, it is really Providential that it occurred when it did and not a few months later when

The Awful Results of the Collapse — Rescuers at Work

Photo by Underwood & Underwood

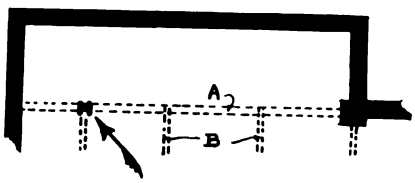
Digitized by Google



it would have been open for business. Look at the pictures in this article and consider the awful possibilities of a collapse of this sort with the house crowded to capacity! DON'T do shoddy work—think what may happen!

There is an important lesson here that should be impressed on every one in the building business. There is more to building than just merely getting the job through. A structure must be safe enough to be used for the purpose it was intended for, and proper precautions should be taken for safety during construction.

One must remember that until a structure is completed in its entirety, there are certain parts that do not obtain their full strength until complete. Anyone who has studied mechanics knows that sometimes a structure only half complete is very weak compared to the strength which it will have when all members are installed; this is especially true of any frame work.

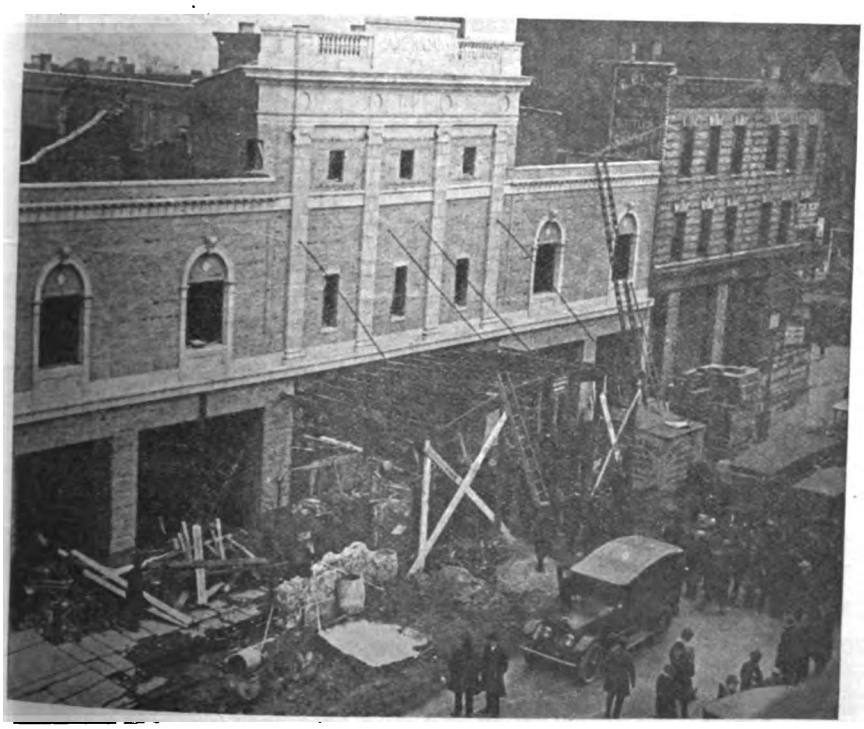


We are all familiar with an arch: all know that it cannot be built without a form to hold the voussoirs in place, but as soon as the keystone is in place, completing the structure, we have something that has an immense amount of strength. Remove any part of the arch and a collapse is certain.

In an article in this issue, Mr. Owen B. MacGinnis writes about the necessity and importance of using bracing during the construction of a building. One must remember that masonry does not acquire its full strength for some time after it is set in place. Frame work sways until braced.

View Showing Fallen Trusses

Photo by Underwood & Underwood



Arrow Points to Column that Moved—
(A) The Truss Supported by Column—
(B) The Trusses Supported on Truss A

During construction there is also a certain amount of vibration of the entire structure due to hammering, etc. Every student of mechanics has had impressed upon him the danger of rhythmatic vibrations; all are familiar with the old precaution of making soldiers break step when they are crossing a bridge.

There have been many varied reports, even from some of the workmen employed on the job, that poor material was used, dirt for cement, etc. These rumors had no foundation in fact. As far as we have been able to learn, no really one definite fault has as yet been found for this collapse. The brick walls themselves did not fall but were carried down when the roof trusses fell.

A built up steel column about 30 feet high of H shape supported one end of a main truss, the other end resting on the wall which was properly buttressed as our picture clearly shows. This column "slipped" off its footing, carrying down the roof, etc. It seems that this column was not securely fastened to its base, which

Street View of Theatre at Time of Accident

Digitized by Google

allowed a certain movement to take place, and which became worse with each little vibration, finally shearing and pulling off the foundation bolts, and then slipping inwards, carrying down the roof, etc.

Careful examination of the pictures will reveal that the walls are intact—there was no slippage of the foundation due to shifting of the earth. The column itself did not collapse, it being in particularly perfect condition; there was no crushing, it was strong enough, but evidently was not properly braced to prevent lateral motion.

One can easily comprehend the immense strain on a foundation bolt when the leverage of a column 30 feet high is working against its resistance.

Many serious building accidents have happened in the past, and each one teaches its lesson. We also all know about the Quebec bridge disaster which occurred some years ago. Builders must always be on the lookout against strains arising in incomplete structures.

Large work can be carried on without any collapse; thousands of successful examples are everywhere about us. It is however dangerous business for inexperienced builders to go about erecting structures having wide spans and height without knowing just exactly *what* they are doing and *why* they are doing it.

The plans of this theatre were designed by Mr. C. A. Sandblom, of New York, who has designed many successful theatres. He drew the plans of this American Theatre and gave a schedule and details of the steel work, etc., *but* he was not employed to supervise the construction. The plans were turned over to the owners, who were also the contractors, and "some one" suggested making a change in the steel work, and a revised set of structural plans were made and these were the ones used in the erection. Messrs. Sylvester Rosenthal and Samuel Moskowitz were the owners and contractors, and both were arrested and are now awaiting trial for manslaughter.

Builders should realize that forms, centers and braces are necessary for safe construction. Haste has been blamed for most of the failures in the building line, still many large buildings have been erected in record time with complete safety to the structure, the mechanics, and public.

It is all in knowing how to do it and observing proper precautions. The small contractor and builder can learn a lot by observing the methods of the large construction companies. Observe how they erect staging, scaffolding, guards for the public, etc. They have found out that it pays big to always remember about safety during construction both for the structure and men.

Inspiring Workmen to Do Their Best

HERE is a story of a large construction job being tied up on account of a strike and how the work was carried along by eliminating the work of the strikers. Laborers who worked with a will overcame the handicaps of doing without machinery.

The job is one of the biggest construction jobs in Chicago, a structure 800 feet long being built for use as the United States Mail Terminal. It is being erected under the direction of J. D'Esposito, chief engineer of the Chicago Union Station Company. It is located east of Canal street, on the south branch of the river, between Van Buren and Harison streets. The R. C. Wieboldt Company, of Chicago, the general contractors, had to dig 142 caissons to hard pan, a distance of fifty-five feet.

How Prizes Helped to Get Work Done on Time

Vice-President A. F. Klein of the Wieboldt Company, tells how he put such pep into the digging by establishing contests with cash prizes of $200 and two gold watches, that every one on the job followed the race with the interest of a championship football game.

"The job was tied up on account of dissatisfaction of the hoisting engineers with the Landis wage ruling," said Mr. Klein. "The caisson diggers were told that if they'd show the proper results these foundations would be 'pulled' by hand instead of with an engine. The results were so satisfactory that the rest of the caissons, thirty, were done by hand even after the engineers had returned.

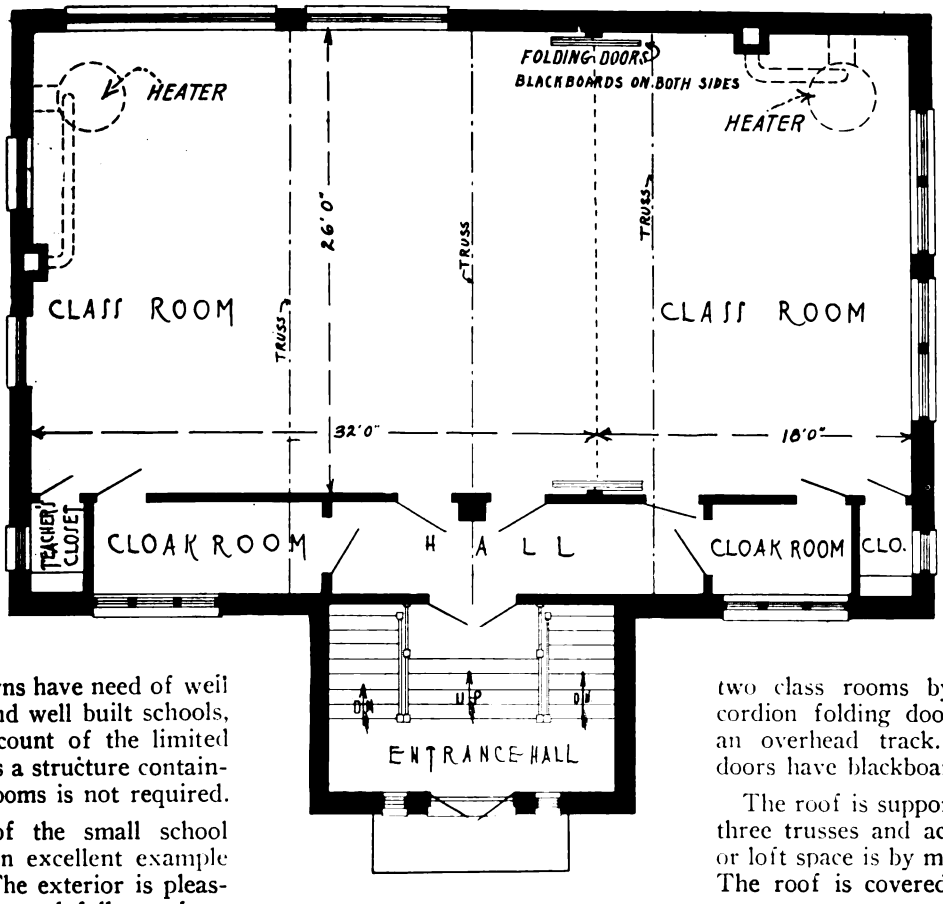
Rewards for Capable Men

"With the idea of rewarding the work of the particularly capable men and in the spirit of sport, prizes were put up. First the preliminary trial heats were held and from these the four best caisson diggers were selected for the finals.

"On the morning of the start of the race the enthusiasm had reached such a pitch that the men insisted on being right in the caissons when the 8 o'clock whistle blew. Bets were placed as to the probable winners and the entire job organization promptly took sides with the four gangs in the race. No hundred yard dash could have been any closer, so nearly matched were the contestants.

"When the whistle blew at 5 and the engineer and superintendent measured the results with a steel tape the closeness of the race may be seen by the following depth records:

Michael J. Naughton	27 ft. 10 in.
Tom Caufield	27 ft. 9 in.
M. Horan	27 ft. 6 in.
J. Reardon	27 ft. 6 in.



"All of these were in a four foot diameter caisson which was lagged, ringed, dug, and hoisted by hand. It was necessary for a man to dig and load into buckets some twenty tons of stiff blue clay in eight hours, besides lagging and bracing the caisson. The ordinary or average depth attained in caissons of this size in eight hours is from six to thirteen feet. The gold watch and prize money were awarded to Naughton, known to the fellow workmen as 'the submarine.'

The prizes were awarded before an audience made up of the entire working and engineering organizations of the job. In my nineteen years' experience in the building business I know of no record approaching this."

All of which shows what can be done toward establishing a more friendly basis between employer and worker and getting more work done. Why isn't it tried oftener?

Neat and Tasteful in Design and Well Planned

A Brick Structure Filling All Requirements

A Country School

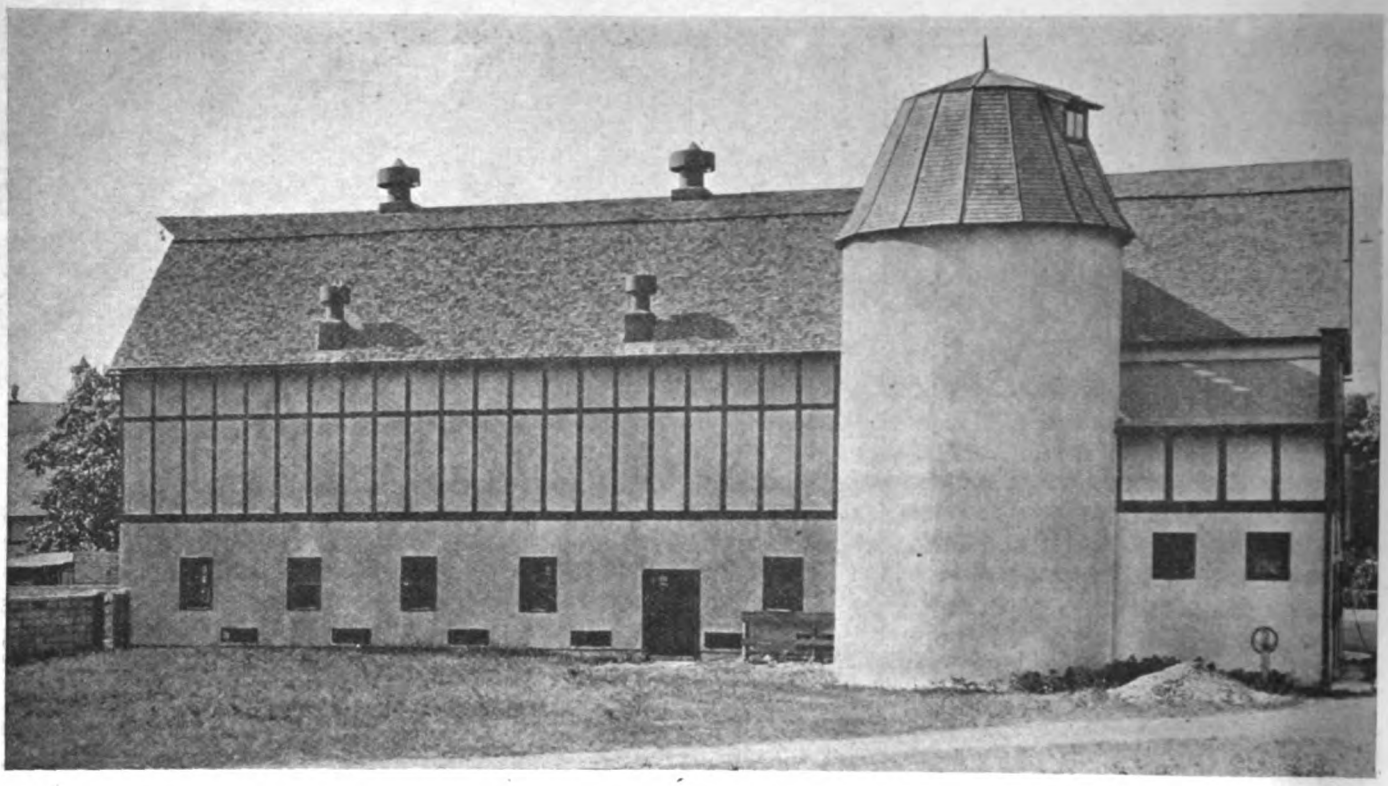
of Colonial Architecture

SMALL towns have need of well planned and well built schools, but on account of the limited number of pupils a structure containing many classrooms is not required.

The design of the small school shown here is an excellent example for a village. The exterior is pleasing in appearance and follows along Colonial lines in its architecture.

The entire building is constructed of brick and is heated by two furnaces located in the basement, which has a cemented floor and is used as a playroom.

The interior is practically one large assembly room which is divided into two class rooms by means of accordion folding doors supported on an overhead track. These folding doors have blackboards on each side.



The roof is supported by means of three trusses and access to the attic or loft space is by means of a scuttle. The roof is covered with slate.

This school was erected at Southampton, Pa., from plans prepared by Mr. Harry Parker—architect of Philadelphia, and the contractor of the was Mr. John Ramsey, Ivyland, Pa.

Besides its use for school purposes the village school is the general meeting room for any civic gatherings of the community.

Modern Barns Made Attractive

MODERN barns are being made more sanitary in their interior construction and particular attention is being paid to ventilation. The exterior design of barns should not be neglected. It only takes a little extra thought to produce a pleasing design so that the barn will not be a blot on a beautiful landscape.

The building shown above is the concrete dairy barn at Arden Farms, St. Paul, Minn. J. M. Hawkins is the owner. Below is shown an interior view of the dairy barn on the Albert French Estate, Lebanon, Ohio. Here the cows face in, which makes feeding easy, some prefer the cows to face out for ease of cleaning. It is a matter of opinion just which is the best method to use; it depends a lot on whether the manure spreader is to be driven right in the barn or an outside pit is used.

How to Develop Hopper Bevels

RICHARD M. VAN GAASBEEK
School of Science and Technology, Pratt Institute, Brooklyn, N. Y.

A HOPPER is a trough usually shaped like an inverted cone, the sides of which splay out from the bottom. Splayed work as it is termed in joinery denotes a surface sloping away from or toward other surfaces. Such work is often found in jambs, sills, sides of windows or doors, hoods over fireplaces, etc. A hip roof is nothing more than an inverted hopper requiring a knowledge of hopper bevels to properly intersect the roof boards on a hip rafter and for laying out the side and top cuts for gutters intersecting on hip roofs.

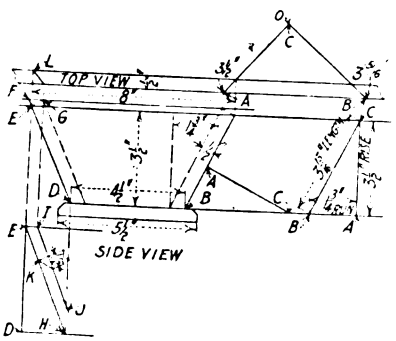

Fig. 2—Method for determining a miter joint for a hopper

Figure 1 shows 2 boxes, the sides of which splay out from the bottom. The sides of the box on the left are mitered at the corners. The sides of the box on the right are butted together at the corners. If you can make these, the boarding of roofs, etc., will be easy for you.

MITER JOINT.—To develop bevel for joint on square edge of the stock, draw at least one side of the hopper as shown at the left, Fig. 2, full height and laying off the exact thickness of the stock to be used in the construction of the hopper. *D-F* (4 3/16″) is the width of stock required for a side. *E-F* is the corner to be removed in producing a level line for the finished top edge. A convenient distance above the side view, draw two lines a distance apart equal to the thickness of the stock to be used, on which the miter bevel on top is to be developed.

Project a line up from the point *F* and also from *G* until it intersects the top view as shown on the left hand side, Fig. 2, and connect the two points thus obtained for the intersecting miter cut. The miter cut can also be laid out with the steel square as shown on the right hand side, Fig. 2, by using the rise *A-C* (3½″) on the tongue and the length (3 15/16″) (bridge measure of the run and rise) on the blade, mark on the tongue for the miter cut.

To lay out the side of the hopper use the run *A-B* (1¾″) on the tongue and the rise *A-C* (3½″) on the blade, mark on the tongue for the splay of the side. Measure on the line *E* in laying off the length of the side (8″). Cut four sides exactly the same length and remove the corner *E-F* before fastening together.

If a bevel square is set to the miter developed on the top edge and used in testing the joint while dressing for a perfect fit, it will mean that the stock of the bevel must be held at all times parallel to the top edge of the stock. This is rather difficult to do and the trouble can be overcome by developing the miter bevel as shown at the bottom left side, Fig. 2.

The bevel square if set to the developed angle can be applied at right angles to the miter joint and tested in the same manner that a try-square is applied in testing a square edge on a piece of stock. Drop the line *E*, on the side view down an indefinite length. Draw the horizontal line *E* on the development a convenient distance below the side elevation. Measure the distance *E-D* on the side view and make the distance *E-D* on the development the same and draw in the base line as at *D*. Carry the point *D* on the side view down until it intersects the base line as at *H*. Connect *E* and *H* giving the corresponding splay for the hopper. Carry the point *G* on the side view down until it intersects the top line *E* as at *I* and from this point produce a line parallel to *E-H* as *I-J*. At right

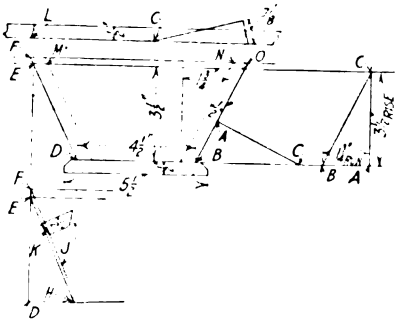

Fig. 3—Method for determining a butt joint for a hopper

angles to these lines draw in two parallel lines, a distance apart equal to the thickness of stock to be used in constructing the hopper and connect the points thus obtained and shown in the development, bottom, left hand side, Fig. 2. Then angle L on the top view is the miter cut laid off on the top square edge of the stock and angle *K* is the angle to set the bevel square for testing the bevel while dressing the joint for a perfect fit, holding the bevel square at right angles to the edge being jointed.

BUTT JOINT.—To develop the bevel for a butt jonit on the square edge of the stock, draw at least one side of the hopper as shown at the left, Fig. 3, full height and laying off the exact thickness of the stock to be used in the construction of the hopper. *D-F* (4 3/16″) is the width of stock required

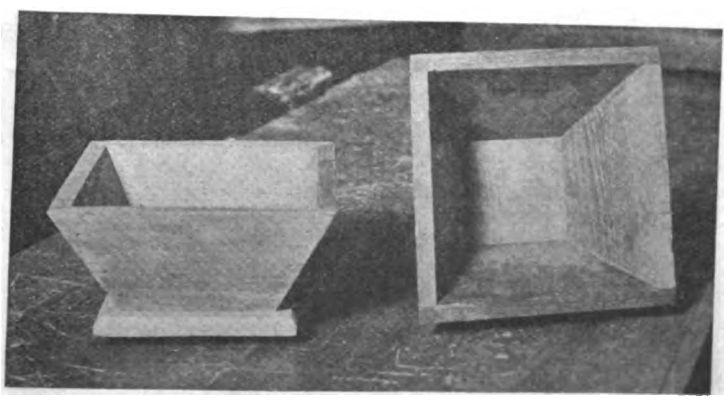

Fig. 1—Assembled hoppers, the one on the left showing a miter joint and the one on the right a butt joint

Digitized by Google

for a side. *E-F* is the corner to be removed in producing a level line for the finished top edge. A convenient distance above the side view, draw two lines a distance apart equal to the thickness of the stock to be used, on which the butt joint on the top edge is to be developed. Project a line up from the point *F* and also from *E* until it intersects the top view as shown on the left hand side, Fig. 3, and connect the two points obtaining the intersecting butt joint.

The butt joint can also be laid out with the steel square as shown on the right hand side, Fig. 3, by using one-half the run *A-B* (1¾″) or ⅞″ on the tongue and the rise *A-C* (3½″) on the blade, mark on the tongue for the butt joint. To lay out the side of the hopper use the run *A-B* (1¾″) on the torgue and the rise *A-C* (3½″) on the blade, mark on the tongue for the splay of the hopper. Measure on the line *E* in laying off the length of two sides (8″). The two ends should be cut twice the distance *E-M* shorter than the sides, the exact length being *M-N*. Remove the corner *E-F* before fastening together.

If a bevel square is set to the butt joint developed on the top edge and used in testing the joint while dressing for a perfect fit, it will mean that the stock of the bevel must be held at all times parallel to the top edge of the stock. This is rather difficult to do and the trouble can be overcome by developing the butt joint as shown at the bottom left hand side, Fig. 3.

The bevel square if set to the developed angle can be applied at right angles to the butt joint and tested in the same manner that a try-square is applied in testing a square edge on a piece of stock. Drop the line *E* on the side view down an indefinite length. Draw the horizontal line *F* on the development, a convenient distance below the side view

Measure the distance *F-E* and *E-D* on the side view and make the distances *E-F* and *E-D* on the development the same and draw in horizontal lines at each point. Carry the point *D* on the side view down until it intersects the base line as at *H*. Connect *E-H* giving the corresponding splay of the hopper. From the point *F* produce a line parallel to *E-H* as *I-J*. At right angles to these lines draw in two parallel lines, a distance apart equal to the thickness of the stock to be used in constructing the hopper and connect the point thus obtained and shown in the development, bottom, left hand side, Fig. 3.

The angle *L* on the top view is the butt joint laid out on the top square edge of the stock and angle *K* is the angle to set the bevel square for testing the butt joint while dressing for a perfect fit, holding the bevel at right angles to the edge being jointed. Fig. 1 shows a photo of the assembled hoppers.

Store Typifies Old Dutch Windmill

A MERE casual glance perhaps wouldn't lead you to suspect it, but the unique structure shown in the accompanying illustration is a specially designed branch store, just completed, of a large retail bakery concern, in Los Angeles, Cal. It is located in a semi-residential section of the city, and, while outwardly styled to typify an old Dutch windwill, it provides a quite commodious little shop, equipped with counters, show-cases and the other usual store facilities.

The structure, it will be observed, effectively simulates the old windmills of Holland, as commonly pictured to us, to the minutest of detail. Not only is this true in respect to general lines, but it is especially emphasized in the great four-winged wind propellers, as well as also even in the haphazard-like laying of the shingles of the dome-like roof. Directly on the front is a sort of porch or awning-covered terrace, and the entrance is placed on a front corner to the left. Dutch blue, in a light and dark shade, is also employed for the exterior color scheme.

The company, which maintains a number of branch retail stores of the ordinary style in the business section, intends to establish several outlying branches of this windmill type, in various parts of the city, of which this is the first. It utilizes the Dutch windmill as a sort of trade mark, and hence the style of the branches is for the purpose of bringing the emblem into greater prominence. The uniqueness of the shop also is accounted of considerable advertising value in that they are sure to attract attention.

The designers are Harry G. Oliver and Ray Smith, architects, of Culver City, California, and the owners Van de Kamp's Holland Dutch Bakers, of Los Angeles.

ETHICS—The science of right conduct and character; the science which treats of the nature and grounds of moral obligation and of the rules which ought to determine conduct in accordance with this obligation; the doctrine of man's duty in respect to himself and the rights of others.

—Century Dictionary.

A Code of Ethics for the Building Industry

A Progressive Movement Tending to Raise the Standards of Practice in the Building Field

THE Congress of the Building Industry of the City of New York seeks a high standard of conduct and character among its members, in respect to themselves and the public whom they serve. As a safe-guard of the important financial, technical, æsthetic and industrial interests entrusted to its members, it offers the following exposition relative to ethical practice; and urges upon its members and the public compliance of the principles laid down.

The Building Industry, broadly considered, includes the Owner, the Real Estate Broker, the Banker, the Loan Broker, the Architect, the Engineer, the Contractor and Sub-contractor, the Material Manufacturer and Dealer, and Labor. Among certain of these groups professional codes of ethics have long been in use, but the Congress believes that there is need for the development of a general code that will define fair dealings for all. No set of rules can be formulated which will particularize all the duties of all branches of the industry in their relation to the public and to each other. The following principles should, however, govern and serve as a guide. All ethical rules may be comprehended within the Golden Rule.

ARTICLE I

General

It is unethical for anyone engaged in the building industry or any of its branches:

Sec. 1. To unduly or improperly increase the cost of the work or to produce work or workmanship inferior to that contracted for.

Sec. 2. To falsely or maliciously injure the reputation or business of another.

Sec. 3. To offer or accept commissions intended to influence sales or contracts.

Sec. 4. To endeavor to circumvent the fair and reasonable enforcement of building ordinances and safety and sanitary codes.

Sec. 5. To resort to or countenance "Shopping."

ARTICLE II

The Owner

Sec. 1. To endeavor to improperly influence the Architect's or Engineer's decisions as to contract obligations.

Sec. 2. To call for unnecessary or full estimates on tentative projects, or from unacceptable bidders or to withhold proper facilities from those estimating.

Sec. 3. To refuse credit data and statement as to reality of the project.

Sec. 4. To deal directly with the Contractor where an Engineer or Architect has been employed for full services including supervision.

ARTICLE III

The Banker

Sec. 1. To fail to give due weight to the Community value of improvements for which loans are desired.

Sec. 2. To fail to acquaint the borrower with all conditions (especially as to approval of materials and construction) under which the loan is made.

Sec. 3. To overload building costs with fees, commissions or bonuses not legitimately earned.

ARTICLE IV

The Real Estate Broker

Sec. 1. To misrepresent conditions or conceal any facts having an important bearing upon the real value of a property.

Sec. 2. To advise a type of development opposed to the community interest.

ARTICLE V

The Architect and Engineer

Sec. 1. To act in any other than a judicial capacity in determining contract obligations; or to fail to require full performance equally by Owner and Contractor.

Sec. 2. To require a Contractor to perform for him any part of the service which is generally recognized as the Architect's work.

Sec. 3. To cover possible oversights or errors by indefinite clauses in contract or specifications.

Sec. 4. To withhold certificates for payment when properly due under a contract.

Sec. 5. To engage in the building trades.

ARTICLE VI

The Contractor

Sec. 1. To give, knowingly, work or workmanship inferior to that contracted for.

Sec. 2. To endeavor to supplant the Architect or Engineer with the Owner.

Sec. 3. To submit to the Owner directly, without the Architect's approval and knowledge, any proposals or estimates.

Sec. 4. To fail to recognize his moral obligation to sub-contractors whose bids he has used in making his own proposal.

Sec. 6. To knowingly or carelessly under-estimate the value or time of completion of any work.

Sec. 7. To withhold payment to sub-contractors and dealers for work or for materials for which he has received payment.

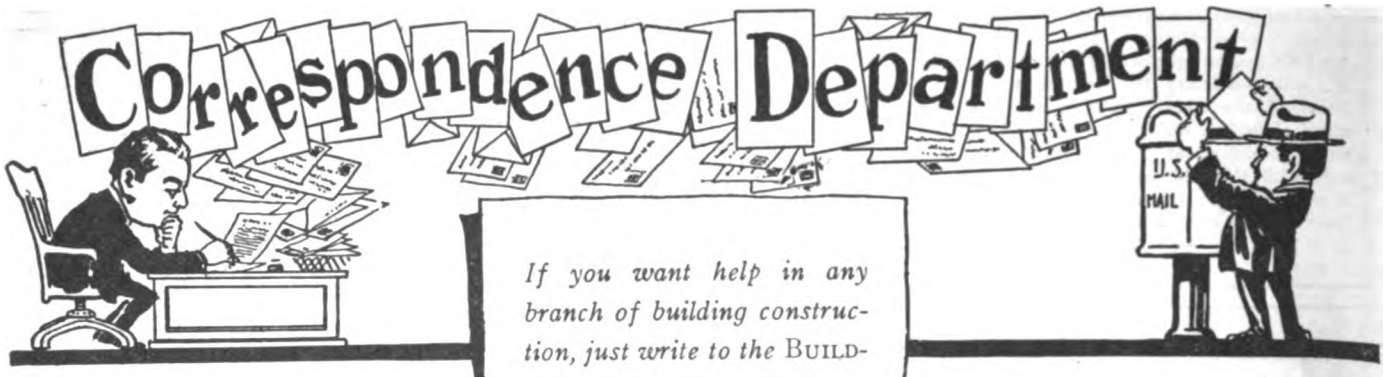
ARTICLE VII

Sub-Contractors and Material Dealers

Sec. 1. To knowingly mislead, through trade customs or terms, as to the real cost or quality of work or materials, and to mislead as to the time of completion of work or delivery of materials at times that cannot be fulfilled.

ARTICLE VIII

Labor



Sec. 1. To restrict the quantity or quality of the output of the individual.

Sec. 2. To increase cost through arbitrary rules as to number of workmen employed or use of plant and equipment.

Sec. 3. To deny to any man the opportunity to learn, and when qualified, to practice a trade.

Sec. 4. To abandon the work pending the decision of disputes between trades.

Short Cut in Putting Down Base

MARK the position of all studs on the rough floor with a lumberman's crayon before plastering and you will find it a big time saver when putting down base, saying nothing about keeping you in good humor. There is no hammering or measuring for studs—you know exactly where they are.—**C. W. Conlee.**

How to Build a Rustic Bridge

HERE is a little snap shot of a simple bridge. Two 2x10 inch yellow pine joists form the principal supports. They are 14 feet long, the clear span

across the brook is 8 feet. The floor is of 2x6 inch joists, laid flat; they are 4 feet wide, laid 1-2 inch apart; the supporting joists are 3 feet apart at their outer edges. The rails are of rustic work as shown. The yellow pine was stained with brown shingle stain. The result was an artistic and substantial little bridge that cost but a small sum. **—Peter Older.**

Cement Washing Sides of Hole When Digging

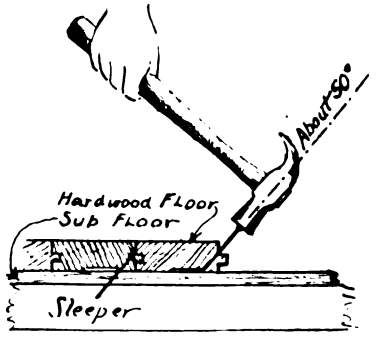
IT is extremely exasperating when digging in sandy soil to have to dig out so much more earth than would be necessary, if the soil was more solid. Several years ago the writer was attending college in Wisconsin. The dollars and half dollars which one could earn doing odd jobs were not to be passed up, by any means. It came about that a local concrete contractor had an opening for one with a strong back and an undersized bank account to dig pits for the installation of septic tanks. We took the job.

One job, was, to all outward appearances, a pipe. The holes were dug at so much per hole and the condition of the ground made quite a factor in the matter of whether a good wage was or was not, made per hour. This particular job was in sandy soil. It dug easy. The first four feet went down quickly and we felt that we were going to make a clean up, perhaps a dollar an hour. Then the trouble started. The first cave-in didn't amount to much, but they kept coming and by the time the hole had reached a depth of ten feet its shape resembled, roughly, the mouth of a funnel. By the time that the pit had been sunk the required thirteen feet, something like twice the usual amount of earth had been thrown out.

Some weeks later another hole was to be dug in soil still sandier. It was discouraging, but a happy thought saved the day and some eight hours' work. Before the first cave-in a cement wash was mixed up in a bucket to the consistency of thin cream and this spread on the sides of the hole. Of course the sides were tapered slightly. The wash soon "set" and prevented the first handful of earth to drop which would lead to larger cave-ins. This idea has been used by the writer several times since with good results.—**Dale Van Horn.**

HAVE you ever used any machinery or device which has saved you time and money?

Have you ever invented any way of doing a piece of work quicker?



If you have BUILDING AGE wants your experience, and will pay regular space rate for it.

Your description should tell just how you saved time and money, either by a special way of using machinery or by short cuts in construction. Point out what methods you were using before adopting your "Time Saver" and show how your new method turns the trick. You can submit as many articles as you want.

Address The Editor, BUILDING AGE, 920 Broadway, New York City.

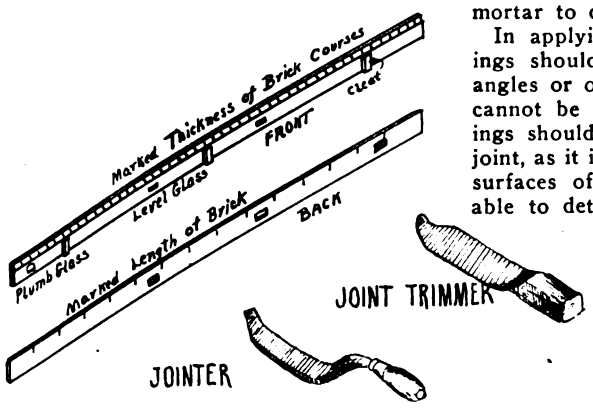
Laying a Hardwood Floor

MANY a carpenter is awkward in laying a thin hardwood floor. The most trouble is in getting the brads at the correct angle. The illustration shows clearly how this should be done.

If you lay the hardwood floor over an old one be sure to rabbitt the threshold if the adjoining room is not to have the new floor.

Should a sliver occur this can be nailed in place by a pin, as this is almost invisible. To drive the pin in without bending grease the point and then tap it lightly, but steadily, and in she goes.—**Godfrey Peterson.**

A Durable Stucco Job



WHILE a student in the Bricklaying Class of the New York Trade School I had the importance of having brick and stone properly dampened when built into a wall impressed on my mind.

A water soaked brick or stone, if built into the wall in that condition, was more injurious to mortar than if they were dry as the water begins to run out of them as soon as they are set on the mortar and carries with it the cementing qualities of the mortar, while if properly damp the molecules of the mortar will be drawn into the pores of the brick or stone by

Digitized by Google

suction or capillary attraction as in drying the water first leaves the heart of a brick or stone when built in the wall.

In the year 1898 I built a brick building and as the walls were being built all exterior joints of the brick work were raked out to a depth of about ½ inch. This gave a good bond to the stucco which was applied as soon as the building was under roof. Before applying the stucco the walls were made thoroughly damp and kept damp for at least ten days after the stucco was applied. It is essential to keep fresh stucco damp and to dry slowly.

The stucco was made one part cement, one-fourth part lime putty and two and one-half parts coarse marble dust and just enough mineral color to bring the mortar to a dark cherry red. The marble dust, cement and color were passed through a screen until the mass became an even color and then the lime putty was added and then just enough water was used to make a plastic mortar and then applied to the walls to a thickness of about one-fourth of an inch with a plasterer's trowel and brought to a smooth, even finish.

Before the initial set of the stucco took place I applied the mortar joints to give the wall the appearance of being built of pressed brick laid up in white mortar. I used a convexed joint 3/16 in. wide and with a projection of ⅛ in. The mortar for the joint was composed of one part cement, one-fourth part lime putty, and two parts fine marble dust. This gave a dense tenacious mortar of a light grey color which was applied in the following manner: The mortar was spread the full length of a straight edge which was 5 in. wide and 8 ft. long. Two mechanics held the straight edge with the feather edge against the wall with one hand each, while with the other hand they applied the joint with a convexed jointer and when the joint was applied and thoroughly pressed into the soft stucco, the straight edge was revolved so its flat was against the wall and the surplus mortar removed from the sides of the joint with a tool made from an ordinary table knife. The straight edge had the thickness of the courses marked on one edge and the lengths of the brick on another edge; those marks are transferred to the soft stucco to be used as guides in applying the joint. The straight edge also contains a plumb and level to aid in keeping the joints level and plumb. On the back of the straight edge there are three cleats to hold the straight edge away from the wall while trimming the joints to allow the fragments of mortar to drop to the ground.

In applying the work the joinings should come at corners and angles or openings and where this cannot be accomplished, the joinings should come under a mortar joint, as it is impossible to join two surfaces of stucco without being able to detect the joinings unless they are blinded in some way. When the stucco has set, all loose fragments of mortar caused by trimming the joints are removed by using a wide soft brush. This piece of work is more than 21 years old and is as good today as the day it was applied. —**D. W. Daley.**

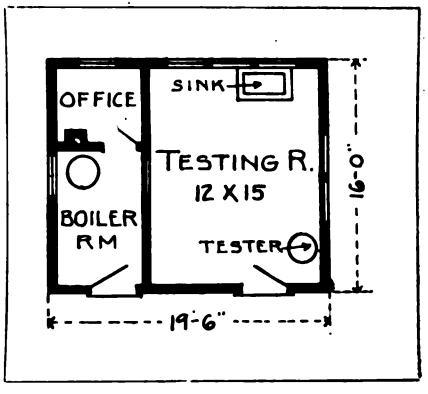
Blasting Down Buildings

THE County Commissioner of St. Mary's County, Maryland, wanted the old poorhouse torn down. It was a brick building, three stories high with basement. The building was about 30x40 ft. with a large brick chimney at each end. There were eight fireplaces, each large enough to hold logs 4 ft. long. The building had been burned and only the brick walls were to be disposed of.

As they wanted the work done quickly and as labor was very scarce, they asked me if the walls could not be blasted down with dynamite. I had never done any work of that kind before so I decided it would be best to blast down one side of the building at a time.

I first marked off the places where I wanted the holes drilled. The walls were about 2 feet thick. The chimneys were triangular in shape with the partition walls built into them. The fireplaces were in the corners of the rooms.

I had the holes made with a pick about half way through the wall and about 6 to 8 inches in diameter. The walls where they joined the chimneys were about 4 to 5 feet thick and it was necessary to make the holes deeper in those sections.



I loaded three cartridges (1½ pounds) of 30% dynamite in the shallow holes and five cartridges (2½ pounds) in the deep holes. The holes were spaced about 6 feet apart along the walls. The charges were all tamped in the holes with some damp clay. Electric blasting caps were used as I desired the cumulative effect of the shots and wanted to fire them all at the same instant with a blasting machine.

After the first shot, the entire side of the building, including the chimney, was down flat on the ground. The same method was then employed on the other sides.

To one who has never handled dynamite this may seem to be very risky work. Dynamite can be used with perfect safety if one observes simple, common-sense precautions; you cannot be careless in its use, however, without danger.

We found this to be a very quick, cheap and labor saving method of tearing down brick walls. It was only at the immediate point of the blast that the bricks were broken and most of them could be used again in building construction after cleaning the mortar off them the same as would have had to be done had the building been taken down by any other method.

It required but 55 pounds of dynamite and 35 blasting caps to dispose of the entire building. The caps cost about six cents apiece and the dynamite about eighteen cents a pound. Two men did the entire job in a little over one day. From this it will be seen that the cost was very low.—**Harry Gough.**

A Simple Milk House

THE picture presented herewith shows a small milk house of simple, substantial construction. It is of frame covered with bishopric sheathing and stuccoed. The roof is of 2x4 inch rafters, sheathed, with 1x8 inch

boards, and covered with asbestos shingles. The plan shows the dimensions and it has proved a handy layout. —**Philip Dyke.**

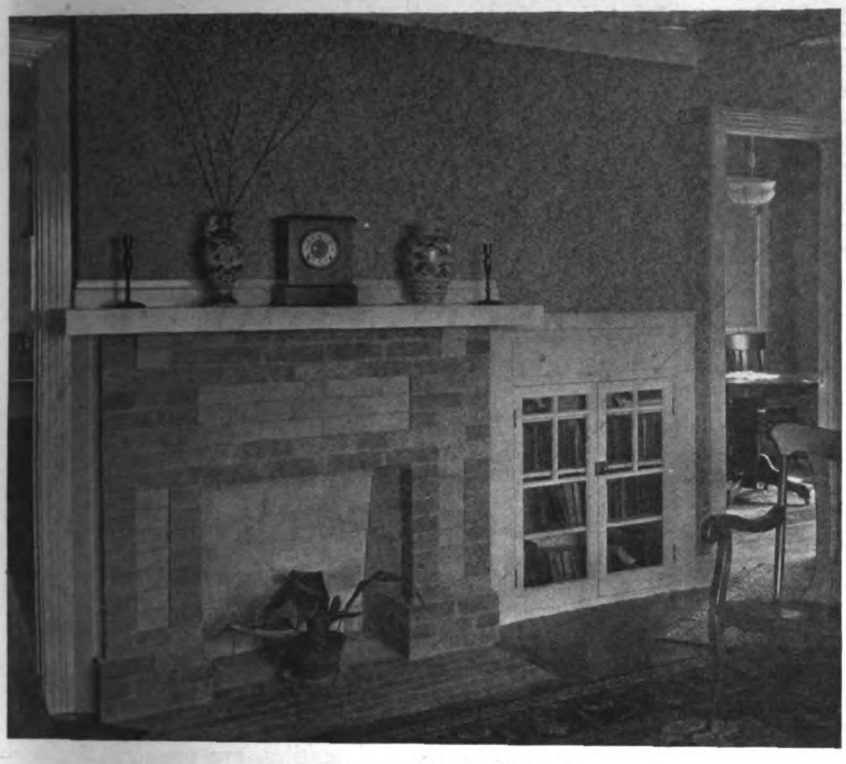
Built In Features

Which Make the Modern Home

MODERN housewives are demanding many built-in features in their new homes and the alert builder is the one who will cater to this desire. As this kind of work can be done indoors it is desirable for the winter season.

An artistic arrangement of china closets on each side of a door is shown here; the door opening leads to an enclosed porch, the doors have semicular tops. Grouped in this novel way the three doors truly present an artistic appearance.

Below is a kitchen arrangement that will certainly please the ladies. The sink has drain boards on each side with drawer and cupboard below.



Artistic Arrangement of China Closets

Back to First Principles in Building

By NOBLE FOSTER HOGGSON

BUILDING operations of ancient time were carried out under one directing head—witness King Solomon's Temple. It was not until modern times that there developed a practice which involved a division of responsibility, architects came to perform one function, contractors another and decorators still another. This procedure has been found far from satisfactory, and the twentieth century has seen the growth of a new type of builder—the construction organization which furnishes a complete building service, including architectural plans, the construction of the building and furnishing the interior.

A building operation of importance calls for the service of many different professions; for the employment of scores of trades; for the selection and purchase of hundreds of different materials and devices.

Successful buildings are not the results of chance. To coordinate and direct all the factors of a building operation so that the outcome will be satisfactory in design, plan, quality and cost is a profession in itself and demands experience and a knowledge of all these factors.

There are a growing number of large construction organizations which include in their personnel, architects, engineers, experienced builders, and students of markets and materials. Such organizations make one contract with an owner which includes architectural design, building construction, decoration, equipment and furnishing.

Cooperation under this form of procedure is secured from the start and it comes as close as is humanly possible to insuring that a building will be completed promptly, satisfactorily, and within the limit of expenditure.

BEFORE any plans are drawn or even a survey made, a conferance is held between the owners and the representatives of the builders at which is determined the procedure with due regard to expense as well as design. The costs of equipment, lighting fixtures, furniture and decorations as well as of the actual construction, are taken into consideration. The cost of the individual items are in this way properly apportioned in accordance with the proposed total expenditure.

COSTS and design having been adjusted and fixed the architectural department of the construction company proceeds with preparation of preliminary designs. While these plans are being completed the construction department is constantly called in for comment and suggestion.

In all such operations it is required that the architectural department and the construction department endorse the plans and specifications as to their conformance with the best and most economical practice for the project in hand, after which they are transferred to the estimating department for a detailed estimate of cost. When the estimate is complete the plans of the building including exterior perspective, interior perspective and detail floor plans, together with samples of suitable materials, stone, metal and textiles, are presented for consideration and approval by the owners.

After the approval of the preliminary plans, final working drawings are developed and represent a project for which the building organization assumes entire responsibility and guarantees the ultimate cost.

Relative Values of Elements Entering Into the Costs of a Composite Building

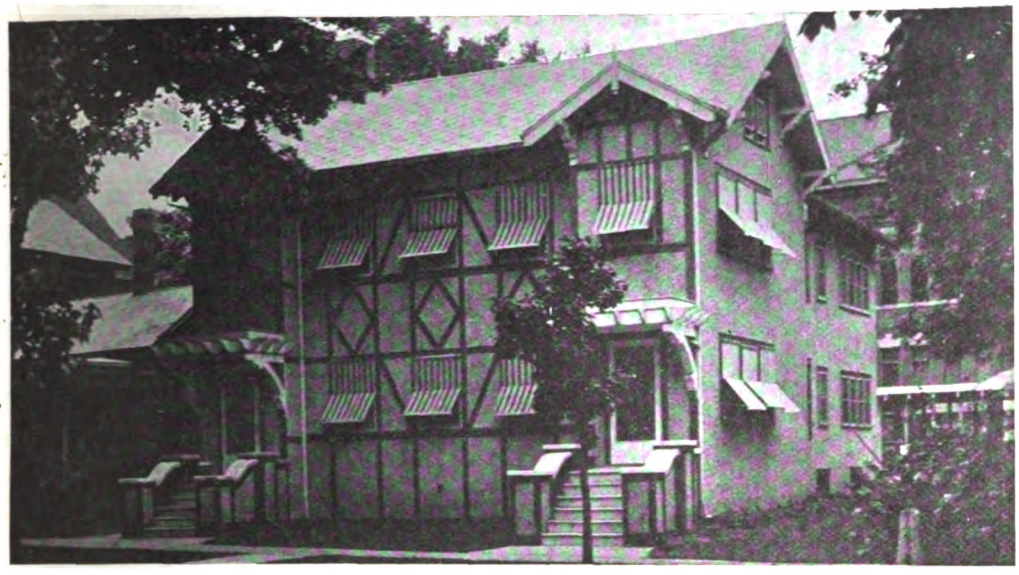
THE division of costs of an imaginary composite building here shown has been arrived at by taking the actual cost figures on seven different types of buildings, including an ordinary two-story brick dwelling (row type), a detached residence, a reinforced concrete factory building, a slow burning construction warehouse building, a steel frame office building, a fireproof and wood floor school building, with stone walls, and a brick apartment house.

Analysis in percentages of cost of a composite building, showing average values of various items for each $100 worth of building work normally done in Philadelphia district:

LABOR—

All skilled labor and supervision on the building, including also stone cutting, and shop work on sheet metal and millwork only	$27.55
Unskilled labor as above	9.44
Office, estimating, general supervision and engineering salaries	5.60
Liability insurance	1.41
Total labor (no manufacturing except as stated)	$44.00

MATERIALS—



Lumber for millwork, concrete forms and structure delivered at site	$8.86
Bricks delivered at site	6.10
Steel—structural, miscellaneous and reinforcement, delivered at site	5.93
Boilers, heaters, piping, etc., for heating	3.05
Plumbing fixtures, piping, etc.	2.76
Cement f. o. b. cars	2.60
Hardware, nails and similar miscellaneous materials	1.78
Sand, delivered to site	1.69
Electric fixtures, conduit wire, etc.	1.60
Stone, slag and pebbles for concrete	1.49
Sprinklers and fire protection apparatus and minor unclassified items	1.04
Building stone	.90
Amount carried forward	$37.80

Amount brought forward	$37.80
Paint	.76
Roofing and sheet metal materials	.76
Plastering materials (no sand)	.65
Lathing materials	.65
Steel sash, etc., delivered to site	.50
Lime (no plaster)	.45
Glass	.40
Cut stone (materials) and terra cotta	.38
Elevators (delivered to site)	.28
Mechanical equipment, cranes, etc.	.21
Tile and marble (materials only)	.10
	$42.88

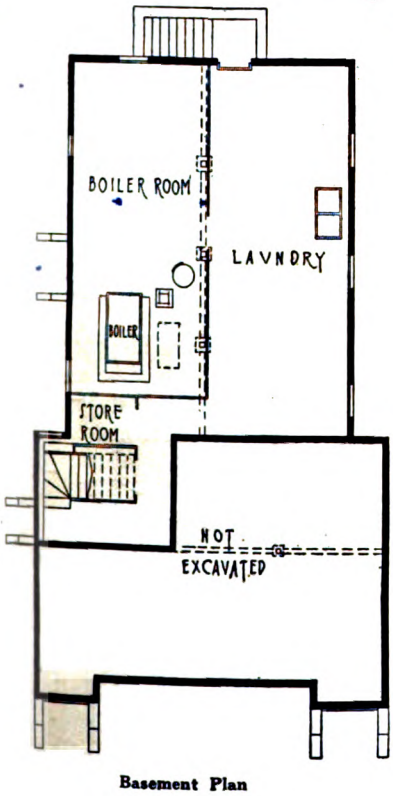
OVERHEAD EXPENSE AND PROFIT—

Office rent, taxes, interest, depreciation of equipment, general expense and overhead (not wages)	$5.80
Net compensation of all sub-contractors (assumed as doing 65% of the work direct)	3.90
Net compensation of general contractor (assumed as doing 35% of the work direct and supervising the balance)	3.42
	$13.12
	$100.00

Digitized by Google

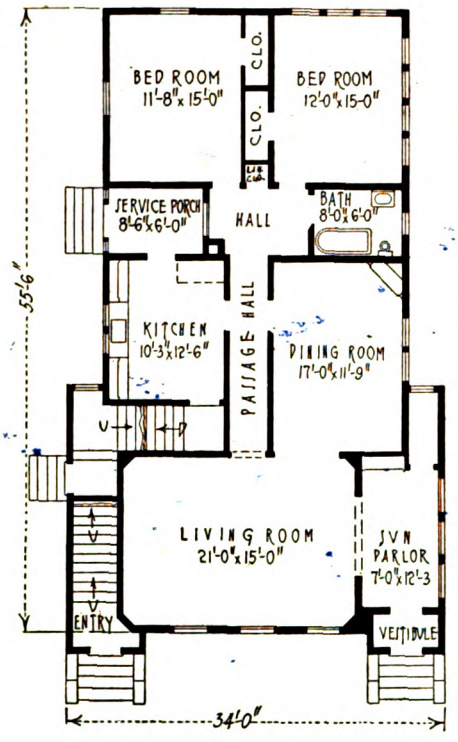
A Stucco Two Family House

TWO family houses have their particular advantage. The one shown here was built by Mr. Charles E. Foster, of the Foster Lumber and Coal Co., at Valparaiso, Ind., and is a good example of what can be accomplished in this line. Mr. Foster occupies one floor, and his daughter the other.



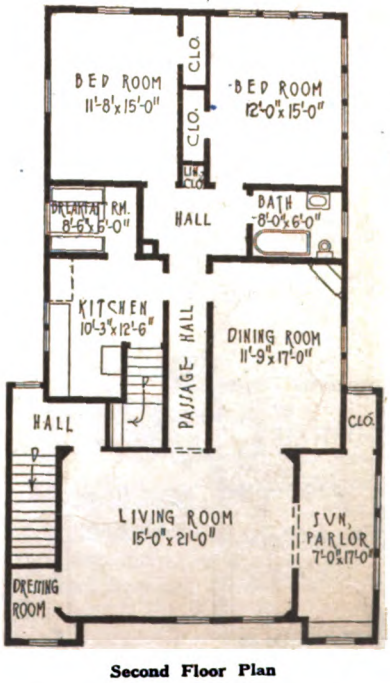
The exterior appearance is decidedly striking, with a combined treatment of stucco, paneled front, attractive doorways, etc. It was built last year, when prices were high, and cost nearly $20,000. The interior is well finished, hardwood floors and trim, with a number of built-in features.

As will be noted, each apartment is really a separate house; each has its own front entrance and kitchen entrance. All rooms are reached from the central hall.



The cellar is reached only from the first floor kitchen; the second floor family can reach the cellar from the rear outside entry. The front partition of the house is not excavated, but there is ample room for boiler room, coal storage, laundry, etc.

Each floor has its sun parlor, the one upstairs being of considerable size; each is provided with a large closet. French doors connect it with the living room.



The first floor has a small side or service porch, and the space this occupies is utilized upstairs as a breakfast room. Each bedroom has a large closet and a linen closet opens on the hall, easy of access from all rooms.

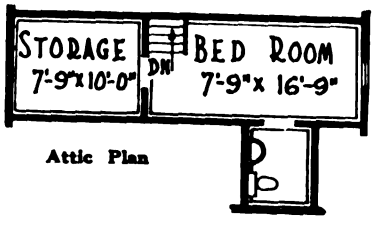
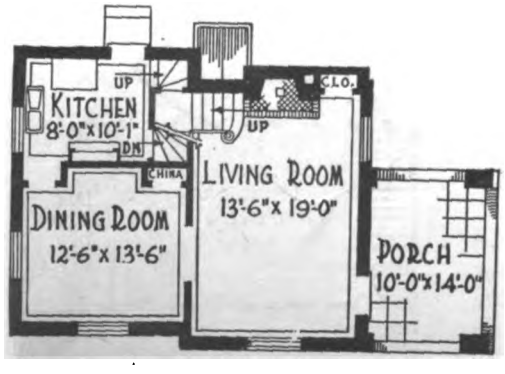
Attractive Cottage of English Design



FOR a small house the English design shown herewith is one that is very attractive, compact and practical. It may be built of hollow tile or wood frame and stuccoed. The same design would look artistic with the walls carried out in face brick, having the twin dormer gables stuccoed in English half timber fashion as shown.

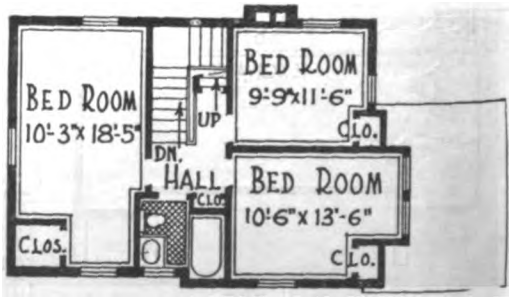
There is no entrance hall; one enters the house direct from the porch into the living room from which the dining room opens. It will be noticed that one can go directly from the kitchen to the stair landing without going through the dining room and living room, this feature gives the advantage of a rear stairway.



In the dining room a space for sideboard has been provided in a recess. The stairway from the living room ascends alongside of the fireplace, and this combination makes an attractive feature of this end of the room.

On the second floor there are three bedrooms, one large and two smaller ones, together with the bathroom. Each bedroom is provided with a closet, and there is a linen closet in the hall. If desired the attic can have two bedrooms, also a toilet room.

The house shown here was built at Narbeth, Pa. Messrs. Wallace & Warner of Philadelphia, were the architects. There was no general contractor on the job but the architects sublet each contract and supervised the construction of the house.



Attic Plan

The First Floor Plan is Shown at the Left.

The porch is arranged so that it can be closed in for the winter with glass and screened for summer use.

The Second Floor Plan is Shown at the Right. Observe the compact arrangement of bedrooms, bath, etc., all served by the small central hall, eliminating waste space.

What the Editor Thinks

The Offense of the Ugly Building

ONE of our contributors this month writes very interestingly about "Beauty vs Service In Building Construction." The point brought out by the author is worthy of considerable serious thought on the part of every building contractor.

BUILDING AGE is advocating better design and construction, and this article is in line with our policy. Some builders have been very persistent in putting up ugly looking buildings. They seem to have a perfect mania for so doing. When a set of plans is shown them that has even one feature that would really look well, they begin to hem and haw and tell the owner "that is very expensive and it will take cabinet makers to do the job, etc."

What architect has not suffered chagrin and regret on viewing the completed house for which he drew the plans and spent many hours of thought in getting things worked out right, so that all would have a pleasing appearance? The window arrangement balanced, and a little bit of moulding here and there, a piece of lattice at another point where there was a big blank wall space, and then —the practical builder gets hold of the job and strips it of every vestige of beauty with the mistaken idea that he is saving in cost!

Let us build good looking houses, something that will be a credit to ourselves and our community. All this would tend to raise the standard of the builders' craft. We sometimes wonder why the general public look down upon the building industry merely as a necessary evil.

It is within the power of the builders themselves to remedy the evil. It will take a little courage for a builder to say: "No, I will not undertake this job; it is not up to the standard; there will be no credit for me to do it."

By erecting well designed structures a builder will gain a very enviable reputation which will be the means of securing many a valuable contract from those who want good work.

Let us all strive to make 1922 a year of better building, both in design as well as in construction.

Building Ethics

DIFFERENT professions and trades endeavoring to be set right before the public have adopted a sort of creed stating the policy of their members in conducting their business. Honest efforts to live up to such a code of ethics are all productive of good.

Due to the shortage of homes there has been page after page in the newspapers about the building industry, and there has been a good deal of just and unjust criticism of those engaged in this business.

Public confidence can only be had by promoting faith and fairness to the public and the various callings that go to make up the building industry; realizing this a Code of Ethics has been prepared and approved by the New York Building Congress at a meeting held December 13, 1921, and this we are pleased to publish on another page. Let us all do our best in trying to live up to these rules —it will make our industry more respected—we ourselves will have a good deal of respect for our own calling.

The proper housing of the citizens and industries of the United States is a very essential business for the future good of our country. It is in safe hands—let all help to raise its standard.

Pleasing the Owner

THE builder who wishes to succeed should make a careful study of the little features that please the home owner.

Be prepared to show them the advantage of some built-in furniture, etc. Give a little thought to how the doors swing.

People vary in size, therefore get sinks, cabinets, etc., at the proper height so that they will be comfortable to work at.

Two Remarkable Building Jobs

IN this issue of BUILDING AGE we have the pleasure of describing a remarkable alteration job that is just about completed. A reading of this article will reveal the daring of the enterprise and the careful precautions taken by the contractors for safety.

We are truly sorry to publish the article on the other remarkable building job—a gigantic fatal failure. The one job was a big success; the other a catastrophe.

The building business requires brains and honesty as well as any other big business. There is work in the building business for big men and it has attractions other than just mere financial gain. It is a pleasure and a pride to do a big job and to feel that you were a party to it.

Illegal Building Practices

IN New York City some ugly revelations are being made regarding "rings" among certain building material dealers, contractors and labor unions. For the good of the building industry as a whole it is well to have these irregular practices exposed. No business can succeed if it is dishonestly conducted, and every honest man connected with the building industry will be glad of this house cleaning. It showed clearly that there are few wrong-doers, but it also showed very clearly that the great majority of men in the building field are straightforward, honest, business men.

The Building Industry

THE construction industry of the United States is the greatest industry in the world. It employs more men than any other industry, provides approximately 30 per cent. of the total railroad tonnage of the country, and in normal times produces annually from three billions to four billions of additional permanent taxable wealth.

Review of Building Situation

CONSTRUCTION activity in November, according to figures published by the F. W. Dodge Co., show that the total amount of contracts awarded (not contemplated) amounted to $192,311,300. This was 45% ahead of November, 1920, and is only 14% under the total for October, whereas November is normally 24% less than October.

All districts except New England and Middle West showed marked increases over the corresponding month of 1920—the decreases in these two districts were very slight, only 1% and 3% respectively.

Residential building continues in the lead, even showing a slight increase over October.

The fact that construction activity is holding up more than usually well with the approach of the winter season is a good indication of an increased volume of activity in 1922.

The contemplated projects in residential construction alone amount to $145,864,000 and $91,583,800 of this is for the three Northeastern Districts. The outlook in the midwest, etc., while not as good as the coast, need cause no one to worry as it is a decidedly healthy showing. This shows very clearly where the bulk of the residence building for 1922 will be done. Builders in the East can prepare for one of the best year's business they have ever had.

Home Building in 1921

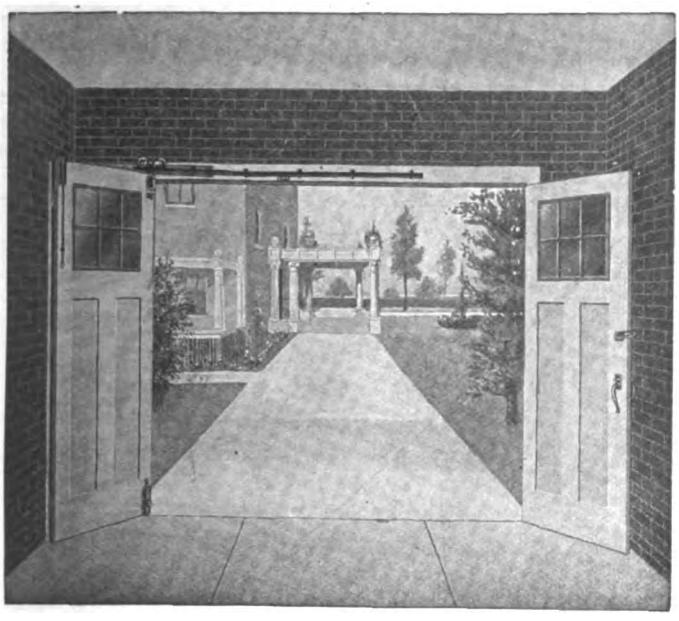
THERE was a decided increase in the construction of dwelling houses in this country during the first ten months of 1921, according to information obtained by the Civic Development Department of the Chamber of Commerce of the United United States.

Construction figures furnished by forty-four important cities, show that during the period from January to October of the present year $603,000,000 went into new construction, while during all 1920 the total in the same cities was only $8,000,000 more. During the shorter period this year 57.9 per cent. of the total was for dwelling houses as against only 36.1 per cent. in 1920.

Figures from some of the reporting cities are not brought up to date as it is not universal practice to make monthly reports, and the indications are that the dwelling percentage will be larger when all figures are in, according to the National Chamber's report.

The estimated cost of all construction reported in the forty-four cities for ten months of 1921 exceeds $722,000,000, of which $349,000,000 is residential, and $254,000,000 non-residential. Alterations, repairs and special construction cost $119,000,000. Not only would these totals be increased if all reports were up-to-date, according to the National Chamber, but as costs have been reduced, each dollar this year represents an increased volume of construction.

The total estimated cost reported by the same cities for the entire year of 1920 was $798,000,000.



Record of November, 1921, Building Contracts Awarded

Classification of Building	SECTION OF COUNTRY New England District	New York District	Mid. Atlantic District	Pittsburgh District	Middle West District	North West District	Totals

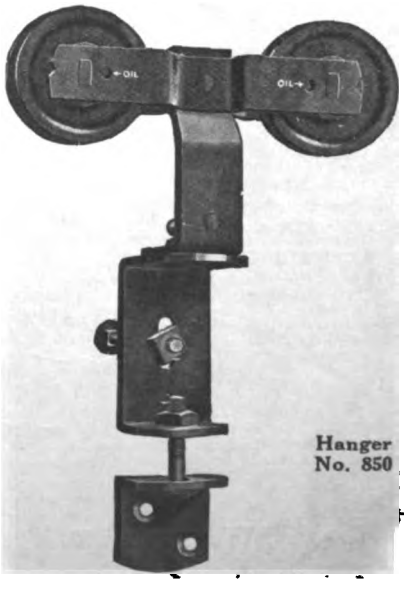
EASE

in opening and closing a garage door is of fundamental importance. "Sticking" is an evil that causes much criticism of Builders.

PROTECTION



against the rigors of winter is another indispensable feature of a garage door. It should be entirely weather-tight. Snow and ice should not in any way interfere with opening and closing the door.

To secure Ease and Protection is a problem every builder can easily solve to the delight of his customers.

NATIONAL
Nos. 805 and 806
Garage Door Sets

are so constructed that a child can open and close the door—a slight push or pull and the doors are wide open or closed. There is not the slightest binding or friction. They are entirely weather and storm proof.

You will secure these two important qualities and also the other qualities of free and easy access, adjustable feature preventing sagging of doors, minimum space, and reasonable price.

Trend of Material Prices

THE following are wholesale prices of basic building materials in the three markets which set prices for the rest of the country.

These prices are presented to show the trend of the wholesale market, which forecasts prices in the retail market. They are not prices which the average contractor can buy at, but are quoted to show him the movement of materials so that he can buy to better advantage.

Followed in conjunction with the Review of Building Conditions, these prices will prove invaluable.

All prices are for carload lots, F. O. B. market quoted, unless otherwise noted.

Redwood—and the permanent beauty of the white house

BUILDERS know all about the troubles some woods give before you can get even a passably good job of white painting.

When Redwood is specified, the most attractive and long-lasting painting job is assured. There's no pitch in Redwood to "bleed" through, nor hard and soft spots to mar the painter's work. Redwood's uniform texture provides surfaces which take and hold paint well.

Properly dried Redwood—painted, stained or unpainted—does not warp, shrink, swell or decay. It assures both permanence and beauty.

Our Redwood "Construction Digest" and our "Engineering Digest" contain much useful data for architects, builders and engineers, indicating the exceptional suitability of Redwood siding, shingles, trim, columns, mouldings, pickets, balusters, gutters, window and door frames—for all exterior construction work where resistance to decay-producing fungus, boring insects and the ceaseless warfare of the elements demands the most enduring wood.

Our Chicago or New York office will gladly send you these digests and any detailed information you may desire.

Redwood should be specified for

Exterior Construction

Including—Colonial siding, clapboards, shingles, door and window frames—gutters, eaves, water tables and mudsills—porch rail, balusters and columns—mouldings and lattice—pickets and fencing—pergolas and greenhouses.

Interior Finish

Industrial Uses

Tanks and vats for water, chemicals and oil. Factory roofs and gutters. Wood block flooring.

Redwood should be specified for

Wood Specialties

Such as—Caskets and burial boxes—incubators and ice-cream cabinets—cigar and candy boxes, etc.

Railroad Uses

Such as—Railroad ties and tunnel timbers—signal wire conduits and water tanks—car siding and roofing.

Farm and Dairy Uses

Such as—Silos, tanks and troughs—hog feeders and implement sheds—wood block floors, etc.

Legal Department

ALL readers are invited to ask any questions that will help them solve any legal difficulty that they may be in. Our legal adviser will answer direct by mail and give his opinion as to the correct procedure. Questions and answers of general interest to the trade will be published in these columns. All inquiries must be accompanied by the name and address of the correspondent so that he may be answered direct or that he may be requested for further information if necessary to the intelligent answering of his question. No names will be published, only initials or a nome de plume. Remember that this service is free to subscribers. Address Legal Department, Building Age, 920 Broadway, New York City.

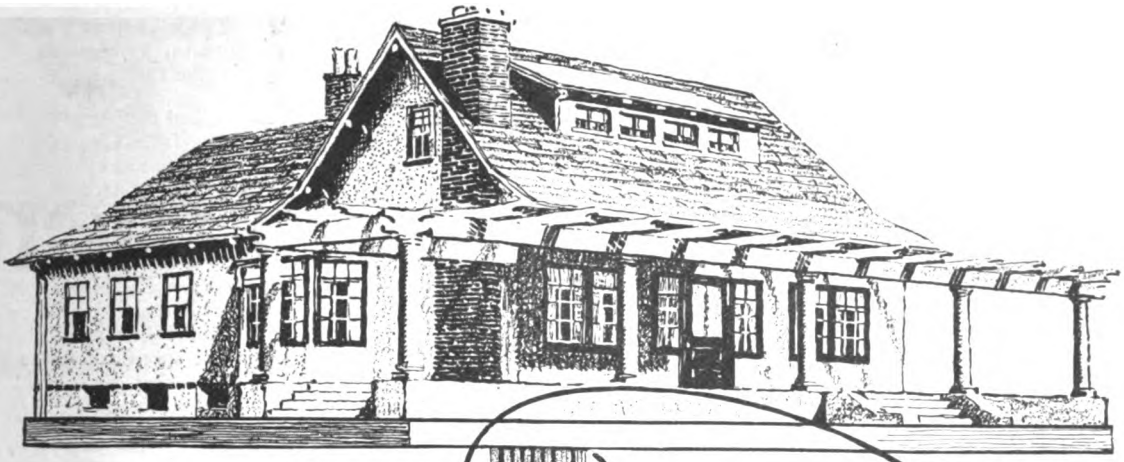
Substantial Performance of Building Contracts

THERE is a trite principle of building law that sometimes puzzles the courts in the matter of its application to concrete cases. It is the rule that where a builder substantially performs a contract in good faith, although not in strict compliance with the contract, he will be permitted to recover the contract price, less a fair deduction in favor of the owner on account of the trivial defects. The trouble arises in determining when a particular contract has been "substantially" performed, and when a defect is "trivial."

The California District Court of Appeal was lately confronted with a case of this kind (Joseph Musto Sons-Keenan Co. vs. Pacific States Corporation, 192 Pacific Reporter, 138). It was shown that a building contract involved more than $30,000 in tiled flooring and marble wainscoting. Here and there were defects, consisting of nicks in marble edges, slightly imperfect joints, uncleaned oil spots, failure of pieces of marble to exactly match or take the same degree of polish, etc. But it was found that an expenditure of $469 would correct any real defects in the work, and that the supervising architect and the owner's president made no objections while the work was being done, although they inspected the work at times when any such defects could have been readily corrected. The court says:

"In our opinion, the question as to whether the contract was substantially performed should be determined upon a view of each class of work considered as a whole; and, so considered, it appears that each class of work was done in strict accordance with the design therefor, and the material used was that called for in the specifications, and, save and except imperfections existing, but not pervasive, for which recoupment was allowed to defendant, it, as completed, constituted a substantial performance of the contract. In such a controversy witnesses will differ in taste as to whether one piece of marble matches another, or whether the joints between the pieces are too wide or too narrow, according to their respective tastes and opinions. . . . This testimony . . . is sufficient to show that the work, as completed and taken as a whole, was a first-class job of work, and done in substantial conformity to the specifications, even though it be conceded that some of the pieces of marble might not be in accordance with individual tastes, that some of the pieces of tiling were not so closely joined as to accord with individual ideas as to workmanship, or that, in some cases, small snips and nicks appeared in the edges of pieces of tile and marble"

Importance of Detail in Drawing Building Contracts



EXPERIENCE has amply demonstrated the value of great care in the preparation of building contracts and specifications. Hundreds of appellate court decisions suggest the warning that the builder who fails to insist upon as much specification of detail as is at all feasible is running grave risks of becoming involved in litigation. This suggestion applies with particular force to structural features which the builder does not understand he is to furnish, but which may be shown or hinted at in the plans. An example is afforded in an Illinois case where it took litigation, carried through to the highest court of the state, to establish the fact that a contract for the erection of a building did not require the contractor to furnish skylights shown by the plans. In this case, the original plans showed openings for skylights, but nothing as to the size, weights or data concerning the lights. In holding that the skylights were not included in the contract, the Supreme Court said:

"The entire work was to be done according to said plans and specifications, and upon turning to them, so far as they relate to the skylights, we find that they show the openings and iron framework constituting the framework for five skylights. We also discover certain lines passing across the openings which indicate that skylight superstructures of some kind were ultimately intended for the building; but no sizes, weights, or data are given to guide one, either in their construction or in estimating their cost, except the size of the openings. Had the appellant (the contractor) been forced to construct skylights under the circumstances, he would have been compelled to have either gotten up an additional plan and specifications for his employes to work by, or the city would have to furnish them, in neither of which cases would they have been constructed according to the plans and specifications on file in the appellee's office at the time the contract was entered into."

Is This Architect Entitled to Compensation?

From C. M. B., Cal. —About a year ago I employed an architect to prepare plans and specifications for a house to cost not more than $16,500. The construction was to be of hollow tile. During the time that was required to prepare all of them the stipulated price was mentioned and was referred to by the architect as the estimated cost of the building desired. There was no contract or agreement entered into by us. It, however, took about a month longer to complete the working drawings than had been promised me and during that time there was a slight increase in the cost of materials. When the contractor's bid was received the price of the house was $33,000. This included the 10% commission of the architect. I was unable to pay this price and hence the plans were useless to me. The architect having rendered some services, I was inclined to pay him something for his trouble and offered

A Convincing Test of NATCO Strength

THE strength of a single NATCO XXX Tile (size 8″ x 12″ x 12″) may be deduced from the result of an endurance test made in the laboratories of Robert W. Hunt & Co., Chicago.

A NATCO Hollow Tile of the above dimensions was placed in a compression machine and the load gradually applied. At the enormous weight of 227,500 pounds continual cracking sounds were heard, but it was not until the gauge read 237,500 pounds that the tile was crushed!

In other words, *one* NATCO Hollow Tile supported a weight decidedly greater than that of an ordinary bungalow and proved beyond doubt its unequalled merit as a building material not only for homes but also for Apartment Houses, Schools, Hospitals, Theatres, Garages, Stables, Factories, Stores, Churches, Club Houses, Hotels and Farm Buildings.

A printed sheet giving this interesting test in detail will be furnished to anyone requesting it.

NATIONAL FIRE PROOFING COMPANY

1427 FULTON BLDG. PITTSBURGH, PA.

Digitized by Google

him $400 in full settlement. He, however, refused this offer and demanded $1,100, or rather three-fifths of 10% of a home costing approximately $18,000. This I refused to pay. Recently his attorney has written me and said that his client is willing to accept the $400, and that if it is not paid immediately they would bring suit. My contention is I owe him nothing. Am I right?"

Answer.—If the reasonable cost of the proposed building was within the $16,500 limit, or reasonably near it, when the plans and specifications were completed, and if the increased cost later disclosed by bids could not reasonably have been foreseen by the architect, I am of the opinion that he is entitled to reasonable compensation for the services rendered. The decisive point is not so much the fact that the plans and specifications proved to be useless to you as the question whether it is the architect's fault that he failed to furnish specifications under which the building could be erected at the contemplated cost.

The law governing the case is involved in the following statement of principles summarized by a standard legal authority from appellate court decisions of the various states:

"Where plans are required for a building not to cost more than a certain sum, or are accepted on condition that it can be erected for a given amount, there can be no recovery by the architect unless the building can be erected for the sum named, *or unless the increased cost is due to special circumstances*, or to a change of plans by direction of the owner. But as this condition is intended for the protection of the owner it may be waived by him by any act which clearly shows such an intention, as where he accepts the plans with the knowledge that the cost of the building will exceed the sum originally proposed. . . .

"Some of the cases . . . hold that an architect who prepares plans for a building pursuant to the order of the owner that the building shall not exceed a certain cost is entitled to his compensation if the cost is 'reasonably near' the proposed amount, and whether there is a reasonable approximation of the actual cost to the proposed cost is ordinarily a question for the jury, although if the excess is great the court can deal with it as a question of law.

"In determining whether the proposed building can be erected for the estimated sum the architect's fees cannot be regarded as part of the estimate." 5 Corpus Juris, 262, 263.

If by reason of the architect's failure to furnish the working drawings within the time he promised them to you prices of labor and material so advanced in the meantime that the house could not be constructed for $16,500, or reasonably near that price, I am of the opinion that you are not legally liable to him for any compensation. In this view of the case, you offer to pay $400, not having been accepted within a reasonable time is not binding upon you.

But you intimate that *after the services were rendered* there was such advance in building cost as prevented construction at less than $30,000, exclusive of the architect's fee. If this is so, the chances are that the architect would be held to reasonable pay for his services. But, as already noted, the recovery must rest on the point that, except for unexpected rise of building costs, the building could have been erected strictly or substantially within the $16,550 limit.

In the Nova Scotia case of Hutchinson vs. Conway, 34 N. S. 554, it was held that where increased cost of a projected building was due to an increase in the cost of material, shortness of the season in which the work had to be done, etc., the architect was entitled to a commission on the contemplated cost.

And the Maine Supreme Judicial Court has gone so far as to hold that an architect employed to make plans for a house not to exceed a certain sum, would not be barred of recovery for his services in drawing plans by an honest mistake or miscalculation as to the cost. Coombs vs. Beede, 89 Me. 187, 36 A. 104, 56 Am. State Rep. 406.

On the facts presented, I am inclined to advise payment of the $400, since you originally recognized that as a sum fairly due the architect, and since it would be expensive to defend suit, to say nothing of the possibility of his recovering a larger sum.

"It is probably true that one who employs an architect to devise and prepare plans and specifications for a building and pays him therefor becomes the owner of such plans and specifications *unless the contract provides that they are not to become his property*. Gibbon v. Pease, 2 Ann Cas. 713, and cases cited in note. But the court found as a fact that plaintiff was the owner of the plans in controversy and that defendant procured for use in constructing the second house under an agreement to pay plaintiff for them.

"The specifications accompanying the plans contained a statement to the effect that all drawings and specifications were the property of plaintiff and were to be returned to him. Defendant insists that this statement was not a part of the contract and was not binding upon or evidence against him, and that the court erred in admitting this provision of the specifications in evidence. Whether this provision was binding upon or evidence against defendant depends upon the facts and circumstances shown by the evidence. As it does not appear that all the evidence is before us, were are not in position to say that the ruling was error. * * *

As applied to the question raised by the gentleman from Colorado, the Minnesota decision is authority for saying that an architect may retain ownership of plans and specifications by express reservation in the contract under which he is retained, and may guard against the owner's use of them on a second house without paying for them. For stronger reasons, where an architect has reserved ownership of plans and specifications, he is entitled to recover against some third person who may steal them and use them without the architect's knowledge or consent.

For a more specific discussion of the architect's proprietary rights in his work, we refer our readers to another article in this department of THE BUILDING AGE, entitled "What Proprietary Rights Does the Law Give the Architect in His Work?" That article, which has not been published at the writing hereof, refers to the following partinent legal authorities: 5 Corpus Juris, 259; 13 Corpus Juris, 963, Wright vs. Eisle, 86 N. Y. App. Div. Rep. 356, 93 N. Y. Supp. 887.

Reservation of Title to Articles Installed in Buildings

THE New York Court of Appeals was lately called upon to consider the interesting question as to how far it is possible for a building contractor and one from whom he buys bath tubs, bookcases and other articles for installation in a building under contract with the owner, to make a binding contract that title to these things are to be retained in the seller until payment of the purchase price.

It is held that, subject to intervening rights of third persons acquiring interests in the property without notice of such reservation, the contractor and the seller of the articles may, as between themselves, stipulate that the articles shall retain their character as personal property even after installation on the real estate, provided that they can be removed without practically destroying them or removing the support of that to which they are attached. And it was intimated that the mere fact that removal of bookcases would leave exposed an unplastered part of walls would not necessarily prevent their removal, as against the purchaser of the premises at a sale of the real estate under foreclosure of a mortgage.

The Court of Appeals orders a new trial of the case to produce more satisfactory proof as to whether certain plumbing fixtures, bookcases, etc., could be removed without material injury to the real property; this being treated as the test of the validity of an attempted reservation of title by the dealer who sold the articles for installation in the particular building.

Put Your Wheelers on a Non-Stop Schedule

KEEPING your wheelers going is mostly a matter of keeping the concrete coming—and that's up to your mixer. If it breaks down, there's a stop in your schedule and in your profits. When you buy a mixer, get the one with the best non-stop record—the

KOEHRING DANDIE

It's the Light Mixer of over-strength construction—Koehring-built and Koehring quality, clear through.

Extra heavy parts and the employment of heavy duty features, wherever consistent with good light mixer practice—the famous remixing action—double gear drum drive—drum rollers, keyed to shafts, and over size bearing surfaces—are what places the Dandie out of the class of ordinary mixers.

Volume production and special processes of manufacture, have put the Dandie Light Mixer at the lowest price at which dependable mixer performance can be purchased.

The name Koehring Dandie is your *best* assurance of greatest non-stop performance.

See the Koehring catalog. The coupon brings it—without obligation. Mail it.

New Catalogs and Publications

1. Weatherstrips should certainly be in demand in January. It is a good time to solicit this business for houses not already equipped. Much valuable information for contractors can be had on the subject by writing to the All-metal Weatherstrip Co., 122 W. Kenzie St., Chicago, Ill.

2. Concrete Mixers are a great aid to efficient construction work. The Construction Machinery Company, 403 Vinton St., Waterloo, Iowa, make the Wonder Mixers, and they will be pleased to send a descriptive circular giving full details, prices, etc.

3. Pipeless Furnaces are very efficient heaters for school houses, churches, stores and homes. A catalog explaining this is issued by the Co-operative Foundry Company, Rochester, N. Y., and will be sent to interested parties.

4. Woodworking Machines are paying investments on a construction job as well as for shop work. A very interesting catalog describing various labor-saving woodworking machines has been issued by the Crescent Machine Company, 206 Main Street, Leetonia, Ohio.

5. Hot Water Supply is essential in the modern home. The Economy Heater Company, 108 So. LaSalle St., Chicago, have a reasonable priced combination boiler and gas water heater with automatic valve control. They will be glad to send a descriptive circular.

6. Asphalt Roofs for large board or concrete roofs, whether steep or flat, can be economically and durably covered with Flex-a-Tile Asphalt Roofing. Full information with specifications can be obtained from the manufacturers. The Richardson Company, 4500 Fillmore St., Chicago, Ill.

7. Window Hardware is a very essential part of the home equipment. The right selection can be made by consulting the catalog of H. B. Ives Company, New Haven, Conn. They also make other builders' hardware.

8. Store Fronts should be attractive—it pays the shop keeper to have it so, and many old style store fronts should be altered. The handbook issued by the Kawneer Company, 2025 Front St., Niles, Mich., will be sent to interested contractors.

9. Construction Work can be produced cheaper by using the proper concrete mixer. A very interesting booklet is issued by the Koehring Company, Milwaukee, Wis., which describes their dandy light mixer.

10. A Builders' Level is a useful instrument for the building contractor to own. It will save money and prevent mistakes on nearly every job. Koelsch & Company, 138 Fulton St., New York, will be glad to send a descriptive circular of the level they make to any reader interested.

THESE catalogs may be secured direct from the manufacturer. If you prefer, write the date of this issue and the numbers of any catalogs on a postal and mail it to "Building Age," 912-920 Broadway, New York City. The catalogs will be sent you without charge, unless otherwise noted.

11. Steam Heating Efficiency can only be obtained by having the proper air valve, as air-bound radiators cannot give off the maximum amount of heat. An efficient air valve is made by the Monash-Younker Company, 112 W. 42nd St. They have a descriptive folder which they will send to any interested party.

12. Sliding Door Hangers are an essential part of the equipment in garages, barns, warehouses, etc. An interesting catalog describing the Meyers Faultless Door Hangers will be sent on request by the F. E. Meyers & Bro. Co., Ashland, Ohio.

13. Concrete Work can only be carried on economically by having the right machinery. One will need mixers, pavers, chuting plants, buckets, bins, carts, etc. These are interestingly described in the bulletin issued by Ransome Concrete Machinery Co., 1774 Second St., Dunellen, N. J.

14. Roof Framing is comparatively easy when you have the right steel square to lay out your work. The next thing is to know how to use this square. A very interesting booklet about the Sargent Steel Square and its uses can be obtained by writing Sargent & Company, 53 Water St., New Haven, Conn.

15. Chains are used to advantage in many parts of a building, hanging sash, tank pulls, bolts, etc. The Smith & Egge Manufacturing Co. have an interesting booklet on the chains they manufacture, and a reference to this will enable one to pick out the right chain to use for each purpose.

16. A Low-Priced Adding Machine is something that would prove useful to every building contractor. An interesting circular of such a machine will be sent by the Illinois Bird Adding Machine Co., First National Bank Building, Chicago, Ill.

17. Weather Vanes are described in a booklet issued by C. G. Washburne & Co., 207 Fulton street, New York. They also make lightning rods and rotary exhaust ventilators.

18. Brick, How to Build and Estimate is the title of a book by William Carver, published at $1 by the Common Brick Manufacturers Association of America, Cleveland, Ohio. This edition is the third and has been revised and enlarged. It presents a vast amount of practical data on brick construction, costs, strength, etc. It is well illustrated and worth having.

19. Metal Lath as used for industrial housing projects is described and illustrated in a book entitled "As a Man Liveth." Plans and views of stucco houses are shown. It is issued by Associated Metal Lath Manufacturers, Swetland Building, Cleveland, Ohio.

20. The House Owner's Paint Book contains valuable information on the best way to have painting done both for the interior and exterior. There are a number of artistically colored plates, giving suggestions on the proper selection of colors, etc., issued by the National Lead Co., New York, the makers of Dutch Boy White Lead.

21. Structural Slate as used for laundry tubs, sinks, urinal stalls and shower bath stalls are shown in a series of drawings and accompanied by valuable data and dimensioned details that have been issued by The Structural Slate Company, Penn Argyle, Pa. They will be sent to interested parties.

22. Steel Joists and Studs are described in a booklet published by The National Pressed Steel Co., Massillon, Ohio. Illustrations and explanations are given on the use of metal lumber in the construction of fire safe construction for the home.

23. Spring Sash Balances are described in an interesting booklet entitled "Detail Drawing and Information for Architects Planning the Use of Caldwell Sash Balances." The descriptions and sizes are given with instructions showing how to install, together with valuable tables giving weights of glazed sashes, etc. The booklet is issued by Caldwell Mfg. Co., Rochester, N. Y.

24. Frame Construction Details is an interesting book issued by the National Lumber Manufacturers Asosciation, 750 McCormick Building, Chicago, Ill., containing illustrations of recommended methods of frame construction from the sill to the rafters. Twenty-eight plates of detail drawings are given. A charge of $1 is made for the book.

Long-Bell TRADE MARKED LUMBER

The home pictured above is Long-Bell Plan No. 282. Many retail lumbermen can show you floor plans of this home. If your lumberman hasn't them write us.

This home is Long-Bell Plan No. 486. Many retail lumbermen can show you floor plans of this home. If your lumberman hasn't them write us.

The Small Home Comes Into Its Own

This is the day of the small home. You see them everywhere and marvel at their beauty and coziness. Nine out of ten of them are built of wood because beauty, coziness and "homeyness" are best obtainable by building with lumber.

And, furthermore—

Lumber is the least expensive building material you can buy today.

Consult your lumberman. He should be able to show you small home plans to fit your needs.

And remember—it is economy to buy the best of materials.

For dependable lumber of uniform high quality in all grades ask your lumberman for LONG-BELL Trade-Marked Lumber.

The Long-Bell Lumber Company
R. A. LONG BUILDING Lumbermen since 1875 KANSAS CITY, MO.

25. **Mixing Concrete in Winter** is the subject of an interesting circular issued by the Portland Cement Association, 111 West Washington street, Chicago, Ill. It gives practical hints on the simple equipment necessary and the methods of operation in making concrete and cement products in the winter.

26. **Builders' Hardware,** comprising various styles of butts, hinges, hasps, bolts, latches, handles, garage door hardware, tracks, screen hangers, blind hinges, etc., are described in a new catalog just issued by The Stanley Works, New Britain, Conn. It is a comprehensive guide to the selection of the proper hardware for the unusual as well as the usual building job.

27. **Modern Oak Floors** is the title of an interesting booklet showing pic tuers in natural colors of oak flooring. also information about grades, how to choose, laying, etc. A copy will be sent to interested parties by the Oak Flooring Manufacturers Association, 1014 Ashland Block, Chicago, Ill.

28. **Metal Weather Stripping** is a subject of timely interest now. An interesting book of Blue Print Details has just been issued by The Diamond Metal Weather Strip Co., of Columbus, Ohio, which shows how their weather strip is applied to windows of different kinds and doors so as to make them storm tight.

29. **Refrigerators and Cooling Rooms** is the title of a book issued by McCray Refrigerator Co., Kendallville, Ind., and describes the different refrigerators they manufacture especially for use in hotels, restaurants, hospitals, clubs, etc. Detail drawings show the construction.

30. **Porete,** the name of a porous, lightweight concrete slab is interestngly described in a number of circulars issued by the Porete Mfg. Co., 26 Verona avenue, Newark, N. J. These show the use of Porete "Slabs" in the construction of floors, walls and roofs that are fireproof and easily constructed.

31. **Wood Turning** is the title of a cloth bound book of 150 pages, which gives practical directions for the manipulation of the lathe in producing various turned ornaments. both plain and twisted. Nearly 200 illustrations clearly show the designs and method of working. To the practical man this $1.50 book is well worth the price.

32. **Bishopric Mfg. Co.,** Cincinnati, Ohio, will send booklet illustrated with photographs of houses built with Bishopric stucco, plaster and sheathing units, "For all time and clime."

33. **Bay State Brick and Cement Coating** as made by the Wadsworth Howland Co., Boston, is interestingly described in their literature which should be in the hands of builders. Samples may also be had.

34. **Appalachian Marble Co.,** Knoxville, Tenn., should be consulted and addressed with reference to samples and information on marble of the finest kind and at moderate cost.

35. **Garbage Disposal** is a problem in the country house as well as the city apartment. A clean and sanitary method is by burning. The Kernerator is built in a chimney and does the work effectively, and an interesting booklet will be sent by the makers, The Kerner Incinerator Co., 1027 Chestnut Street, Milwaukee, Wis.

36. **House Plans** are shown and described in several books published by The Keith Corporation, 533 Abbay Building, Minneapolis, Minn. They also publish Keith's Magazine, a monthly devoted to home building and decoration.

37. **Hollow Concrete Walls** can be made economically by the use of the Van Guilder metal portable form, which enables the contractor to build a hollow concrete wall easily and rapidly. A descriptive circular will be sent by the manufacturer, the Van Guilder Double Wall Co., 77 South Avenue, Rochester, N. Y.

38. **Sheathing Paper** is a necessity on all buildings, and the selection of the proper kind to use is important. Bird & Son, East Walpole, Mass., manufacture the Neponsit Sheathing Paper, and they will send samples and catalog to any builder.

39. **The Use of Redwood** for architectural and building uses is described in booklet No. 5, issued by The Pacific Lumber Co., 2070 McCormick Building, Chicago, Ill. This booklet will be sent to interested parties, whether intending home builders or contractors.

40. **Window Installation Costs** can be greatly reduced by the use of the Anderson Window Frame. A valuable book for builders on this subject will be sent by the Anderson Lumber Co., Dept. F-1, South Stillwater, Minn.

41. **Small Kitchens** can have all essential furnishings in a small space if properly arranged. To meet this need kitchenette equipment is made by the La Grange Fixture Corporation, La Grange, Ind. They have an interesting catalog, which will be sent any one interested.

42. **Tile Composition Flooring** is described in the catalog of the Corkstone Products Co., 539 N. Wolfe Street, Baltimore, Md. This flooring is suitable for bathrooms, kitchens or porches and halls in houses, as well as for stores and public buildings.

43. **Concrete Mixing** on the job is best done by having a good power mixer. The Little Whirlwind Mixer Co., 438 Gould Street, La Crosse, Wis., have an instructive circular describing their Whirlwind mixer.

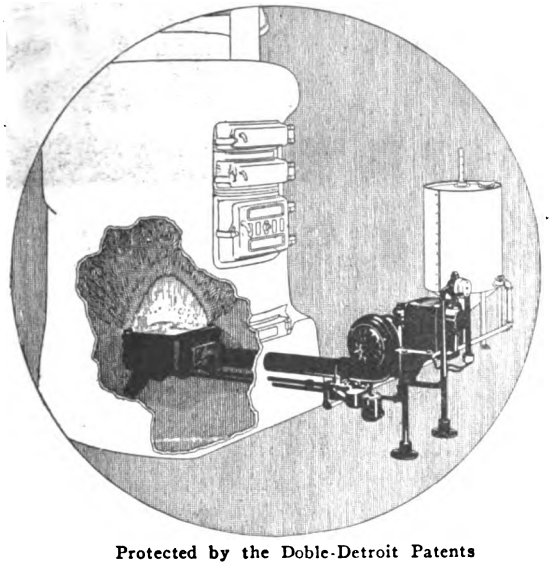
44. **Mortar Colors** bring out the full beauty of brickwork if the right kind is selected, such as are manufactured by the Clinton Metallic Paint Co., Clinton, N. Y. They will be glad to send a color book and specifications to any one interested.

45. **Kidders Hand Book** for Architects and Builders has just been issued in its 17th revised edition. It is now more than ever a reliable reference book of useful data and tables regarding every branch of the building industry, both in materials and methods of construction. Professor Thomas Nolan of the University of Pennsylvania is the Editor in Chief. This new edition contains 1,907 pages and is exceptionally well illustrated, bound in leather with gold edges. Price, $7.00—published by John Wiley and Sons, New York.

46. **Increasing Closet Capacity** means saving valuable space. The Knape & Vogt Mfg. Co., Grand Rapids, Mich., will send an illustrated catalog of their system of garment care that can be installed in old as well as new houses. Builders can give their customers more room in less space by its use.

47. **Weather Strips and Screens** are needed for doors and windows. The Victor Parting Bead Co., Reading, Pa., have an interesting circular describing their weather strip, which allows for expansion and contraction.

1922 "Own Your Home" Exposition



THE Executive Committee of the Fourth Annual "Own Your Home Exposition" has announced that the show will be held in the 69th Regiment Armory, New York City, Lexington avenue and Twenty-fifth street, from April 22 to 30, 1922.

It is believed that the downtown location of the Show this year will draw even greater crowds than attended uptown last year. Every phase of home planning, financing, building, equipping, furnishing and landscaping will be shown on the Exposition floor in an effort to encourage thousands of harassed rent payers of New York and its vicinity to either start building at once or join a savings and loan society and start putting the nesessary money aside.

Cleveland Building Show

FAILURE of the city to have its new $6,000,000 auditorium ready in time has caused the postponement of the American Building Exposition, Cleveland, from January 4th to February 22nd. It will cover a period of 11 days, terminating March 4th. Home, commercial and factory building and equipment will be featured.

Nokol is adaptable to any type of furnace— Steam, Hot Water or Hot Air

Nokol is on the Underwriters' Laboratories list of approved appliances.

A Home Built for Comfort Needs Nokol's Clean, Even, Automatic Heat

The three primary modern conveniences are: electric lighting, plumbing, and Nokol automatic heating. Users of Nokol say it is as great a comfort as either plumbing or electric lighting. Home owners who do not use Nokol simply do not understand that real heating comfort is a fact through this automatic service.

A few years hence a home built for comfort and lacking Nokol automatic oil heating will be an unusual thing, just as to-day a city home without electric lighting is an unusual thing.

Nokol gives heat at precisely the temperature desired, through thermostatic control. When the temperature of the house reaches the desired point, Nokol automatically stops burning fuel. When the temperature falls below that point, Nokol automatically starts up. Thus Nokol uses only enough fuel to deliver just the amount of heat required for perfect comfort, as determined by the user. For this reason Nokol is highly economical.

Another element of economy: In the burner a definite quantity of oil is mixed with a definite quantity of air, *complete combustion* taking place. Nokol burns with a sootless, odorless flame.

From every standpoint, Nokol is the most satisfactory investment that can be put into a home built for comfort.

RED CROSS
EMPIRE PIPELESS

The Acknowledged Standard

of Pipeless Furnace Construction

For school houses, churches, stores and homes, the Empire Pipeless does away with all the old uncertainty and nuisance of stoves, and does it inexpensively. Stoves consume all the oxygen in the air, making it dry and unhealthy. But the Empire Pipeless heats every part of the house, from ceilings to floors, with a constantly-circulating moist air from which the health-giving elements have not been exhausted.

None of the dangers of fires which are ever present where stoves are used. But one fire to attend to once or twice daily; coal and ashes kept in the cellar where they belong—not tracked through the house to half a dozen stoves.

The Empire Pipeless burns any fuel—hard or soft coal, coke, wood or gas.

We make the Red Cross Empire Pipeless in sizes up to 33-inch fire pot, which affords the dealer a wide range of furnaces to sell.

We also make the well-known Red Cross BERMUDA, AJAX and EMPIRE WARM AIR PIPE FURNACES.

Get Ready for the Spring Building Boom!

Make your own window frames, blinds, moulding, trim, etc.—NOW—on an "American" Woodworker

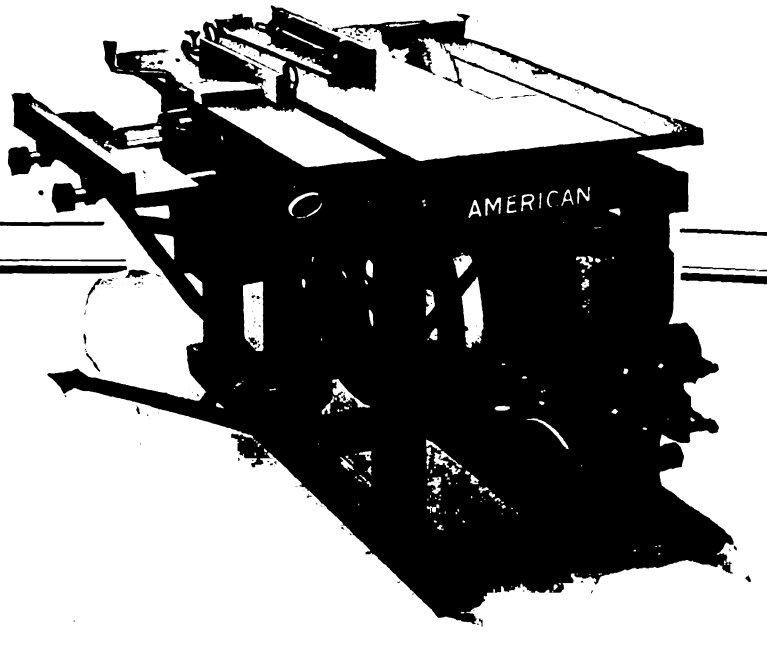
INSTEAD of figuring at mill prices on window frames, blinds, moulding, trim, etc., on your spring building contracts, do what many builders and contractors are doing—making them during the off season—on "American" Contractors' Portable Variety Woodworkers. Just on these items alone, you can make real worth while savings.

When construction work starts, you can take the "American" right on the job and save countless hours of time and labor by doing many jobs right on the "American." As an example, here's what Patrick J. Grant, a builder in West Orange, says:

"It does the principal things the average carpenter needs. It mortises, tenons, moulds, grooves, plows and joints, rips, cross-cuts and bores. It recently saved me $60 in one day boring a number of green cedars. In building a six-room house I figure the saw and jointer saved me $150.00."

The "American" Variety Woodworker is a self-contained unit of eighteen high-grade woodworking machines. The machines are so combined and arranged that four men can work on it at one time without interference.

The "American" is designed right and built right for long, hard, continuous service and places in the hands of a builder or contractor, the equal of a complete mill.



Write us NOW for Bulletin No. 77 that fully describes the "American" Contractors' Variety Woodworker and our line of saw benches, planers, matchers, hoists, cut-off saws, etc.

American Saw Mill Machinery Co.

50 years of just plain "Know How"

have developed Huther Brothers Saws to a point equalled by none others on the market. This is especially well represented in our Patented Dado Head which is a most amazing means of simplifying intricate cutting.

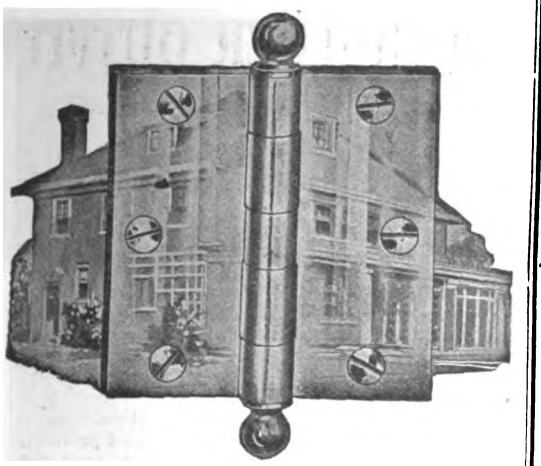
It consists of two outside saws, each of which is a groover in itself, and as many inside cutters as necessary to perform the required cut.

This Dado Head cuts perfect grooves, either with or across the grain, and does not leave rough edges as is the case with ordinary groovers.

We will gladly send you a Dado Head on appoval which you may return at our expense if unsatisfactory.

Prestige that Dates Back to the Pioneer Days of the Saw

Among our vast assortments of:



Solid Tooth Circular Saws
Mitre Saws
Dado Heads
Solid Plate Groover Saws
Matcher Cutters
Lock Corner Cutters and
Specially Ground Circular Saws

you are bound to find a saw for every kind of woodworking you do.

VAN GUILDER OUTFIT

For Building Reinforced Concrete

Double Monolithic Walls

We have over eighty Subsidiary Building Companies and are organizing new ones continually. The builder controls the company and the territory.

No Company is permitted to use our construction without a thorough training by our Efficiency Department, therefore successful construction work is guaranteed.

The builder must not be misled.

The cost of machines is not the question.

It is the quality and cost of the finished product.

Our machines are labor-saving devices—cut out half the labor cost. They have no equal and no successful competitor.

We are absolutely in a class by ourselves.

Van Gulder Double Wall —strong, dry, warm in winter, cool in summer.

We advocate All Fire-proof Construction for the conservation of life and property. The fire loss in this country is greater than in all the rest of the world combined. Fires are more devastating and destroy more lives than war. Wood construction is simply fodder for bonfires. USE AS LITTLE WOOD AS POSSIBLE.

The Carnegie Steel Company at Youngstown, Ohio, and the Cambria Steel Company at Johnstown, Pa., have invested about a MILLION DOLLARS in Van Gilder Double Wall Concrete homes.

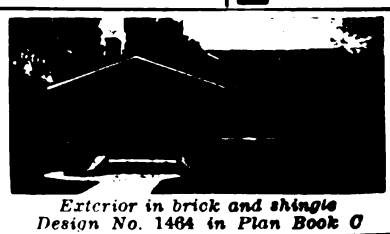
20 Engineering Building :-: :-: ROCHESTER, N. Y.

Your Prospect's

first interest in your proposition is aroused by the excellence and distinctive character of the home studies you show him. How important it is, therefore, that you have a collection of the latest and most authentic **plans** that you can get.

KEITH'S PLANS
FOR THE NATION'S HOMES

are nationally known plans with a reputation behind them. Illustrated from photographs of actual Homes built. For over twenty years they have satisfied the demand of home builders for homes of beauty, individuality, convenience and comfort and may be built for the least cost.



SPECIAL OFFER. Set of 12 plan books—3 of bungalows, 4 of cottages, 3 of 2-story houses, 1 of 2-family houses and one of garages—together with two years' subscription to Keith's Magazine—**all for $6.00.**

Keith's is an authority on planning, building and decorating homes. For 23 years this $3 a year magazine has specialized in building homes of moderate cost.

Every contractor and lumber dealer accepting this offer receives a discount on plan service.

Another Room Without the Cost of Building It!

THAT'S just what is being done in thousands of homes and apartments today. Here's an interesting example. See the above photograph—it shows part of a group of 68 two-family apartments being erected by Mills & Sons, Chicago. Each apartment on the second floor has been increased from five to six rooms. How? By installing the Murphy In-A-Dor Bed! But the cost of this additional room has been saved—and think of the tremendous saving in heating, furnishing, lighting, decorating, and household drudgery.

The MURPHY IN-A-DOR BED

The Murphy In-A-Dor Bed is a sanitary—comfortable—all metal—a "regular" bed (full size or twin) pivoted to the jamb and threshold of a standard closet door. The simple mechanism enables it to swing through the doorway—and to be lowered into place with utmost ease. This bed is perfectly balanced—it cannot close up accidentally. The bed clothing is kept in place in any position.

We have a complete technical service department which is co-operating with architects and builders. We will help you with your floor plan scheme. No charge or obligation whatever. We will be glad to furnish you with specifications and detailed information. (Write for illustrated and descriptive folder on the Murphy Ironing Board and Cabinet.)

There is only one "In-A-Dor" Bed—"IT'S A MURPHY"

William E. Walker, Architect

Disposing of Waste Without Cost

Waste cans and garbage pails are always an intolerable nuisance and health hazard. No one wants them. Why not eliminate them by specifying a

KERNERATOR
Built-in-the-Chimney

Reg. U. S. Patent Office

in your residence and apartment building projects? It burns **all** household waste without the use of any commercial fuel. It efficiently disposes of **anything**—from waste paper to bottles or tin cans.

The refuse, after being thrown into the handy hopper door in the kitchen or hallway, drops down the flue into the incinerator. The dry waste, in burning, dries the wet waste, so that it, too, readily burns. Non-combustible articles are dried, sterilized and later dropped into the ash pit.

The KERNERATOR is installed when the building is erected under an absolute guarantee. It is found in 85% of all new apartment buildings and fine residences in cities where this company is established.

Practical Books
for
Carpenters and Builders

Hick's New Builders' Guide

This standard book has just been revised and brought thoroughly up-to-date by the addition of much new material. It authoritatively covers masonry, hollow tile, estimating, roof framing, etc. Recommended by experienced men as the best modern text book for apprentices and journeymen. Full of practical "short cuts." A section of the book is devoted to tables which save considerable time that otherwise would be spent in lengthy figuring.

Contents by Chapters: Layout of Site, Excavating, Sheet Piling and Pumping. Shoring and Underpinning. Stone Masonry. Water-proofing Foundation Walls. Concrete Construction and Forms for Concrete Footings and Foundation Walls. Brickwork. Hollow Tile Construction and Costs. How to Do Stucco Work on Metal Lath, Brick and Wood Lath. How to Lay Out and Build Fireplaces. Chimney Design and Construction. House Framing. Roof Framing. Mitering Planceers, Mouldings, etc. Carpentry and Construction Kinks. Metal Ceilings and Walls. Estimating Quantities of Materials. Estimating Labor on Carpentry. Estimating Brickwork. Short Cuts in Estimating Forms, etc. Miscellaneous Tables. 360 pages, 4½x7 inches, 300 figures. Flexible fabrikoid, $3.00.

Arthur's Estimating Building Costs

A book giving short cuts for estimating materials, output of labor and costs for all kinds of building work. The tables are especially reliable.

The book begins with the excavation, and ends when the house is finished. The chapters are: Excavations and Piling, Concrete, Brickwork, Stonework, Plastering, Metal, Roofing, Painting, Plumbing and Heating. Miscellaneous includes Hardware, Electric Wiring, Tiling, Bonds, Tables, Rafters, Cisterns, Weights, Comparisons of Cost Between Brick and Frame Buildings; Hints on Drawings. 228 pages, 4½x7 inches, 29 figs., 91 tables. Cloth, $1.50.

THE NEW KIDDER
Architects' and Builders' Book

Everyone in the Building field uses "Kidder's Pocket Book," and this new edition is larger and better than ever. Prof. Nolan and the other authorities, who have worked with him in the revision and rewriting of the various chapters, have described the latest improvements in the methods and equipment.

They have quoted from many authentic sources as well as giving results obtained in their own daily practise. Every item has been carefully checked and rechecked to see that it is technically correct, and the aim throughout has been to present clearly and concisely, and in the least possible space, all the information that is likely to be required by the architect, builder, structural engineer, draughtsman, or contractor, including data for estimating the cost.

The New Kidder has 1900 pages of text, over 1,000 specially prepared diagrams and numerous tables. It is furnished in an attractive flexible binding with gold edges. $7.00.

Distinctive Country Homes

A collection of 100 plates of distinctive homes with views of exteriors, doorways, gates and windows and floor plans. They range from the small house for a suburban plot to the more pretentious villa, with a good selection in all cases. 100 plates, 10x12 inches in double envolpes. $4.00.

McCullough's Practical Structural Design

A complete system for the design of beams, floors, girders, trusses, columns, walls, foundations, footings, etc. The big feature of the book is that no knowledge of algebra or higher mathematics is necessary to understand the explanations, for all calculations, etc., are presented in the form of the ordinary arithmetic that every builder knows. The book contains the most approved practice of up-to-date offices and is profusely illustrated. 320 pages, 6x9 inches, 200 figures. Cloth, $3.00.

Arthur's Home Builder's Guide

A treatise for those about to build, covering the selection of the site, the planning of the rooms and proper materials to use in construction.

Contents by Chapters: The "Lay" of the Land. The Planning of the Home. The Big Four. A Firm Foundation. The Framework. Covering and Adorning the Frame. The Bungalow. Brickwork. Cement Stone—and Mere Stone. Lath and Plaster. Sheet Metal Work. The Interior Finish. Plumbing and Gasfitting. Ventilation. Heating and Lighting. Painting. Finish Hardware. An Analysis of an Ideal Plan. Tornado Construction. Wind Bracing. 144 pages, 5x8 inches. Cloth, $1.00.

Level and Plumb With Your Own Instrument

$5.00 BRINGS IT TO YOU

Free Trial

Order the Aloe—try it for 10 days—put it to the most rigid tests. If you are not pleased, return it at our expense and your $5.00 will be refunded.

Better, Quicker Work

This instrument will add immeasurably to your efficiency and put you in the big builder class—will do more to increase your business, income and prestige than any investment you ever made. The Aloe Convertible Level is the world's best—a combination of both level and transit and quickly converted to the use of either. Absolutely accurate—satisfies the requirements of the most exacting—yet so simple that anyone can use it.

Above illustration shows instrument in Transit position. (Can be easily and quickly converted.)

FREE Write for this Book

BE A BIGGER BUILDER

Aloe Convertible Level and Transit Combined

You Learn to Use It In An Hour

No technical knowledge necessary. No previous experience needed. With our simple and complete instruction book, included free with every level, you can immediately put the instrument to work. It is a level and transit combined—takes sights either above or below the horizontal. You can use it for leveling foundations, walls, piers, streets, walks or curbings—to run straight lines for ditches or drains—boundary lines for fences or trees—surveying lots and fields—plumbing walls, shafts, trestles, posts and pillars.

Easy Monthly Payments

Just $5.00 brings it to you—for a free trial. If perfectly satisfied, pay the balance in small monthly payments. The instrument will be sent at once and from the first day it will be working for you—paying for itself by saving you the cost of borrowing an instrument or the fees you have been paying other men for this work.

Write for Free Book

Our free book—"Be A Bigger Builder"—tells you how to increase your income—how to get the profitable jobs and become a bigger man in your community. Write for this book today.

Section of Outside Wall of House, Showing Wool Between Studding.

Mineral Wool for Building

Mineral Wool has superseded all other materials used for similar building purposes because it does "a great work at little expense." A house lined with Mineral Wool has an indestructible, fireproof and vermin-proof guard; it protects the entire household. In the winter time it keeps the cold air out, facilitating proper heating and economy in fuel. In the summer it keeps the heat out.

This material, being of fibrous, inelastic composition, acts as a deadener and muffles all sound. It is considered the best insulator material on the market, making it a perfect refrigerating machine.

Mineral Wool makes life-long friends of all its users. If you are skeptical as to its power, let us demonstrate. We can prove all claims. Write us to-day.

U. S. Mineral Wool Co.

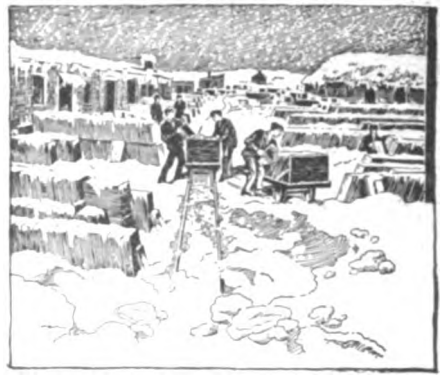
Richards-Wilcox

House Door Hangers



There is an added convenience as well as dignity in a vanishing French door. Such a door lends beauty to any home.

Every day sees an increasing number of homes being equipped with convenient vanishing French doors. The home builder is learning that the old-time sliding door type, with its faults, has been completely eliminated by the new R-W house door hanger—the hanger that allows the door to be easily and quickly operated without noise or jar of any kind. The special adjustment feature of R-W house door hardware makes it a general favorite with builders.

M. L. Schlueter, 223 W. Illinois St. Chicago, Ill.

Be A Floor Surfacing Contractor

Make $5,000 to $15,000 or More Yearly

New, uncrowded field. Architects and general contractors know the American Universal and prefer its work. They prefer to sublet the floor surfacing contract, as it is a big business in itself. Business comes easily the American Universal Way. We furnish office forms, advertising, etc.—in fact we practically set a man up in a business of his own.

RE-SURFACING OLD FLOORS

Every building, large or small, is a prospect. Hundreds of floors right in your own vicinity need re-surfacing. The owners will be glad to have you do it when you show them how easily and quickly the work can be done the American Universal Way. Old floors made like new—new floors made perfect. Don't ever get caught out of work again—get into a big paying business of your own. Floor Surfacing Contractors pay for machines first month and make big profit besides.

WRITE TODAY for full information. Act NOW.

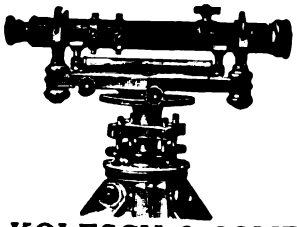
Improved Boring Machine



This machine is from new design, and no pains have been spared to make it a first-class machine in every respect. The spindle is made of crucible steel, has No. 2 Morse taper hole to receive chuck, and the bearings are of genuine babbitt metal. It has two stops to regulate the travel of the spindle, one in the head to adjust the downward stroke and one in the treadle for the upward stroke. Greatest length of travel of spindle is 6½ inches. Distance from center of spindle to column, 10". Table is 26" x 36". It is balanced and has a vertical movement of 21". Spindle is balanced by a coil spring attached to arm on top of frame, making it self-contained. The bracket that carries the driving pulleys has an adjustment of two inches, which is very desirable. T & L pulleys are 8" x 3" face, and should make about 800 revolutions per minute. If belt gets loose, loosen screws in front of bracket and by turning set screw on top till your belt is of the right tension.

BISHOPRIC

The Super Stucco-Plaster Base

"Bungalow Court"—Wichita, Kansas.
This beautiful court built by Mr. Claude E. Neil, who has gained distinction as a home builder. Bishopric Stucco Base used in all construction.

CLAUDE E. NEIL
Builder of Better Homes
Beacon Building

Wichita, Kansas, October 10, 1921.

THE BISHOPRIC MFG. CO.,
Cincinnati, Ohio.

Gentlemen:

I am sending you photograph of "Bungalow Court," on which I used your creosoted Bishopric Base, medium weight, nailing same directly to the studding, and covered it with Portland Cement Stucco. I have one of the very best Stucco jobs in this City.

I became interested in your Bishopric Base several years ago and was much more interested when I learned that it had been successfully used in Topeka, Kansas, for more than seven years, withstanding the terrible winds we have in this section without cracking the stucco.

Personally, I have used Bishopric Base for about three years and am absolutely converted to its use for all stucco work, and you may be sure that I will continue to use it whenever I have an opportunity. You may use this letter in any way you see fit.

Yours very truly,

CLAUDE E. NEIL.

A House Built of BISHOPRIC Means:

(a) Least Cost for Labor
(b) Least Cost of Material
(c) Speed of Construction
(d) Strength—Stability—Endurance
(e) Weatherproof Qualities—Insulation
(f) Living Comfort—Winter and Summer
(g) Lowest Maintenance Cost

THE DOVETAILED KEY INTERLOCKS THE PLASTER
BISHOPRIC STUCCO AND PLASTER BASE
TRADE MARK REGISTERED

We have prepared "Bishopric for All Time and Clime," a booklet for you, containing facts and figures, and illustrated with photographs of beautiful houses built with Bishopric stucco, plaster and sheathing units. Ask for it.

USE FACE BRICK
—*It Pays*

IN deciding the material to be used, the contractor must guide his selection by the service it will render the owner and choose a material for its appropriateness and beauty, its enduring character, and its economy. ¶ Face Brick possesses certain merits which every builder should always bear firmly in mind and explain to prospective owners.

"Face Brick Bungalow and Small House Plans." 184 designs, in four folders which group, 3-4, 5, 6, and 7-8 room plans separately. Sent complete for $1.00 (single folders 25c each).

"The Home of Beauty." Fifty of the best designs, with floor plans, for medium-size brick houses, submitted in country-wide architectural competition. Sent postpaid for 50c.

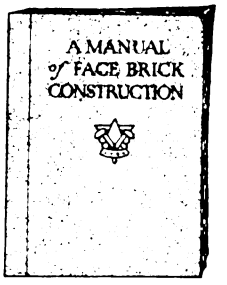
1—***Face Brick are 100% Efficient Structurally***

Size and form easy to handle; tremendously strong, withstanding up to 12,000 lbs. pressure per square inch; resist attacks by fire and corrosions of time, and are practically everlasting.

2—***Face Brick Possess Unequalled Artistic Qualities***

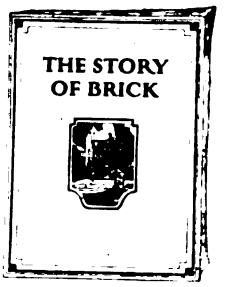
Variety of colors and textures is unlimited, permitting uniform tones or blended shades; the enduring colors are an integral part of the brick; possibilities for individual character to be obtained through the treatment of brick bonds and patterns, and the color, texture, size and kind of mortar joint are limited only by the ingenuity of the designer.

3—***Face Brick are Thoroughly Economical***



First cost only slightly more than frame under present material prices; maintenance and depreciation practically negligible — no patching, repairing or painting ever necessary; affords fire safety and low insurance rates; promotes comfort, health, sanitation, and reduces heating costs; gives high re-sale value.

4—***Face Brick Increases Sentimental Value***



Gives genuine, personal satisfaction in ownership of a beautiful, enviable home; pleases artistic sense and gratifies personal taste.

FOR THESE REASONS

"Use Face Brick—It Pays"

"Manual of Face Brick Construction." A practical handbook of correct building methods. Also contains thirty-one house designs in color, with floor plans. Sent postpaid for $1.00.

"The Story of Brick." An interesting, illustrated book of the history of brick and essential information for all who plan to build. Sent free.

Removes the Unpleasantness of Furnace Work

You can take care of your furnace without the disagreeable work of shoveling ashes and the unpleasantness of stooping into dust and dirt that surrounds you, and covers your clothes.

Note the illustration. See how the cans are mounted; how they revolve on an iron frame; the position of the cans with one always beneath the ash pit.

See what an easy matter it is to take care of your heater with the Sharp Rotary Ash Receiver. Simply rake the ashes through the hole in the ash pit into the can below.

By its installation, homes are made cleaner, safe from burning ashes, and the cellar is always free from ashes and ash cans.

Builders, Building Supply Dealers and Agents are invited to take up with us the matter of selling rights in their territory.

Send for Descriptive Catalog

The cellar as clean as

the rest of the house

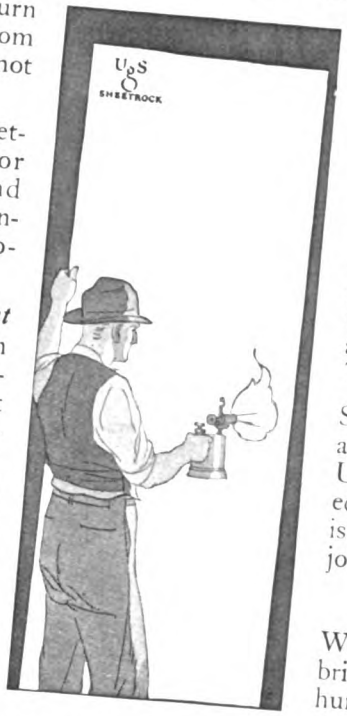
Sheetrock Won't Burn or Buckle!

Sheetrock won't burn because it is made from pure gypsum rock—not wood or paper.



Every section of Sheetrock is inspected for fire-resistiveness and approved by The Underwriters' Laboratories, Inc.

Sheetrock Is Permanent

Made from gypsum plaster—the same material used for the finest interior walls—Sheetrock is unaffected by heat or moisture. It will not shrink, warp or buckle; gives lasting satisfaction.

It Goes Up Quickly

Sheetrock is cast in broad, rigid, ceiling-high sections which are quickly and economically erected. It is tough and strong, saws and nails without breaking.

Sheetrock can be put up in any weather and takes any decoration, wallpaper, paint or panels.

Sheetrock Saves Fuel

Sheetrock is a splendid non-conductor of heat and cold. Sheetrock walls and ceilings help keep rooms warm in winter and cool in summer. They reduce fuel bills.

Sheetrock also protects against vermin. The USG patented nailing edge and Sheetrock Finisher insure tight, flush joints.

Clip the Coupon

We have a plan that is bringing big profits to hundreds of carpenters and contractors. It can do the same for you. Let us tell you about it.

Sheetrock is inspected and approved by The Underwriters' Laboratories, Inc.

TARGET and ARROW for INDUSTRIAL

WE do not advocate Target-and-Arrow for roofing all types of industrial buildings, for we realize that, like all other roofing materials, it has certain limitations, *but where a light weight, fireproof, durable roof covering is essential, there is nothing just as good as Target-and-Arrow.*

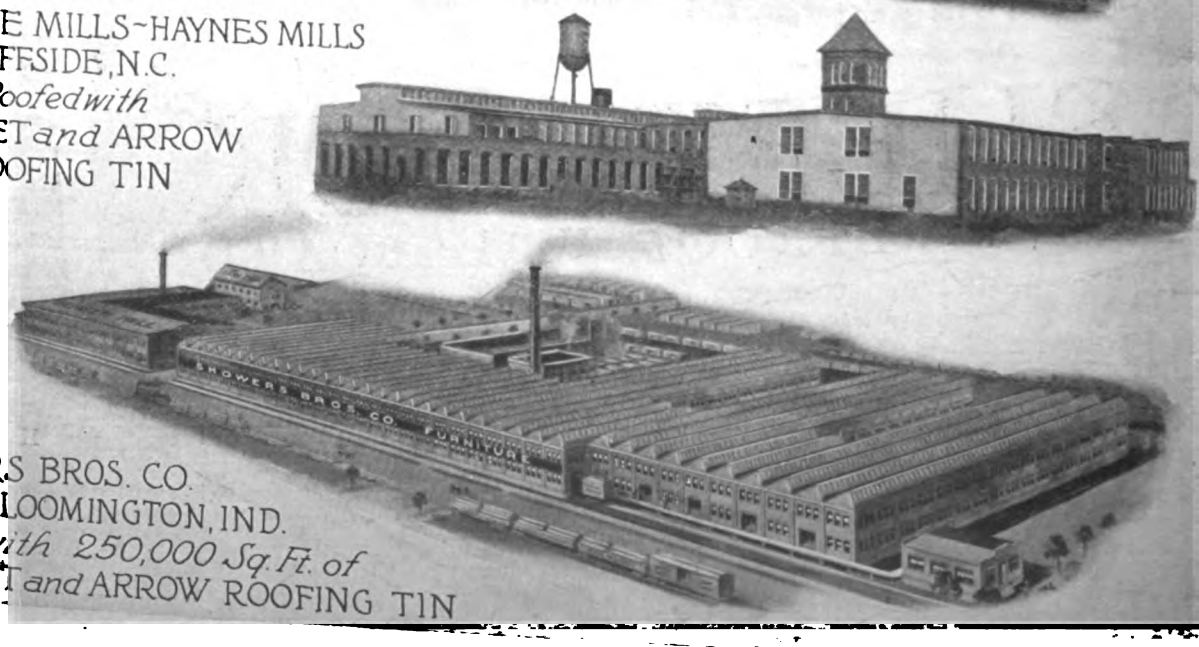
Here are some of its unusual features—compare them, item for item, with other roofing materials on the market today:

Adaptability—Target-and-Arrow can be applied to a greater variety of roof shapes than any other kind of roofing material. It is entirely satisfactory on any surface with a slope of more than ½" to the foot. *It can be laid at any angle or over any curve.*

Light Weight—Target-and-Arrow weighs less than 7/10 of a pound per square foot, saving cost of massive construction necessary to support heavy roofing materials.

Water and Wind Tight—Due to the formation of the double locked and locked and soldered seams, which turn the individual sheets into a continuous sheath, Target-and-Arrow roofs are proof against driving rains, hurricane winds and the seeping trickle of melting snow and ice.

"Fireproof"—not just "Fire Resistive"—You cannot burn Target-and-Arrow in the hottest fire and it requires 2500 degrees of heat to melt it. Moreover, the locked seams hold the roofing tin together, forming an unbroken, *unburnable blanket* even if the roof deck should collapse or burn away.



Diverts Lightning—Actual tests have shown that *properly grounded* tin roofs protect the building and its contents from damage by lightning.

ROOFING TIN BUILDINGS

Addition to MORSE MILLS-PUTNAM, CONN.
Roofed with 2500 Sq. Ft. TARGET & ARROW

Stays Put—Target-and-Arrow does not soften, ooze or run in summer's heat nor harden and crack in intense cold; its expansion and contraction is slight when compared with other kinds of sheet metal, hence it does not crack or pull apart at seams and joints.

Lasting—Will not rust or corrode during the life of the building, because Target-and-Arrow is made by a special *hand-dipping process* based on an old Welsh method of making terne plates in which the sheets are *repeatedly soaked and dipped by hand in several pots of boiling palm oil and molten metal, consuming thirty-five minutes' time in coating each sheet*, whereas a sheet of ordinary roofing tin is coated in twenty seconds!

Target-and-Arrow Roofing Tin will solve more roofing, valley, gutter and flashing problems than any other roofing material on the market today.

Hundreds of keen Architects, Engineers and Business Men have specified that Target-and-Arrow be used on their new buildings and extensions to old buildings because it *had been used on their old buildings and had stood the test of time!*

WHY TAKE ANY MORE CHANCES?

Williamsport Telfax Color Chart and a booklet on modern wire rope mailed on request.

WILLIAMSPORT is a QUALITY Wire Rope

For years the output of this mammoth plant has been absorbed by operators, whose requirements demanded uniformly high quality.

Increased facilities now make available to all, this quality wire rope. Millions of dollars have recently been spent on new additions, machinery and equipment, including a modern wire drawing plant. And today we are one of a few who draw all their own wire.

We invite and welcome all visitors to every part of this great plant. We want you to see how carefully we guard every step in the manufacture of Williamsport Wire Rope.

Here are two grades of wire rope; same size; same construction

They look so much alike that the maker himself cannot distinguish the difference. It requires a laboratory test. And, yet there are six cents difference per foot in the base price and *four tons difference in tensile strength.*

Countless mistakes have occurred since wire rope has been made—some willful—some perhaps fatal, in the marketing and use of wire rope under these conditions.

You don't need to buy wire rope this way anymore—WILLIAMSPORT protects your purchase

The core of every Williamsport Wire Rope now contains their new Telfax Patented Tape, definitely marking each grade of wire rope, thus removing forever the element of chance and necessity for guessing. Look for it.

It is the only wire rope made that provides this positive protection. So that now, **anyone** can distinguish at once the grade of wire rope he receives if he specifies Williamsport. This protection is of vital and far reaching importance to all wire rope users.

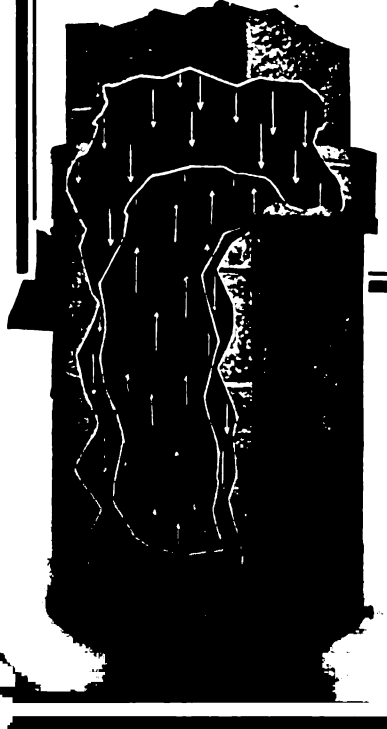
38 ROOMS!



This residence has about 38 rooms, is 3 stories high, except the front, being a T-shaped building, having 10 bathrooms alone and an extraordinary glass exposure.

A completely equipped hot water system failed to heat satisfactorily and 3 medium sized Red Cross Empire Pipeless Furnaces were installed. The result was perfect heat distribution and another distinct achievement for the

Red Cross Empire

PIPELESS SYSTEM

The furnace with a reputation

Years of experience are back of this splendid furnace and every piece or section is just the proper size and weight.

It is built to give a lifetime of satisfactory service, economically and efficiently.

You are guaranteed 70 degrees of heat in every room in zero weather and with less fuel consumed than by any other system.

Investigate and be convinced! We have dealers in every locality and will be pleased to send you circulars, etc., describing the Red Cross Empire Pipeless upon request.

This Is Your Service—Use It!

FREE BOOKLETS ON THE USES OF CONCRETE ARE YOURS FOR THE ASKING

The Portland Cement Association offers you its service, without charge, on how and why to use Concrete.

Our free booklets contain complete, reliable instructions, in every-day language, on every common use of Concrete.

Some of these booklets are:

Recommended Practice for Portland Cement Stucco

Concrete Basements and Foundations

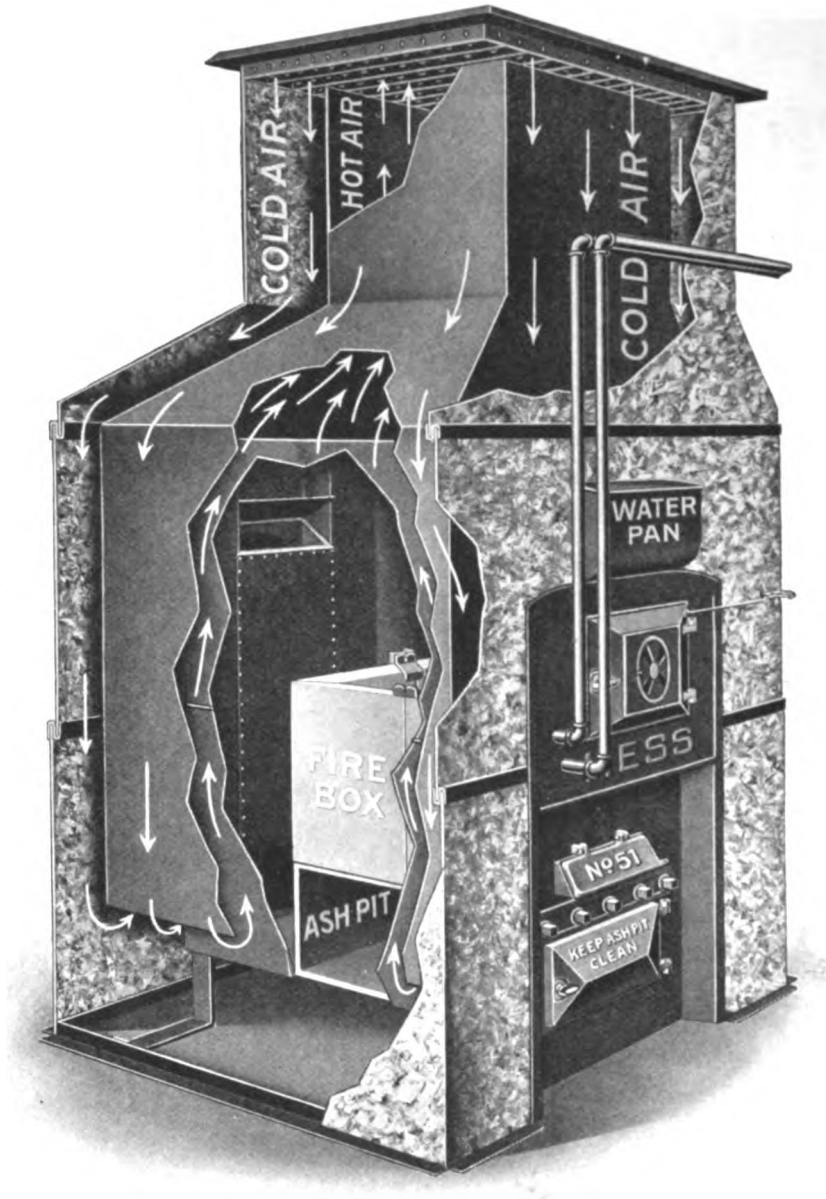
Concrete Building Block and Brick

Concrete Block Garages

Concrete Swimming and Wading Pools

Concrete Schoolhouses

These are only a few. If none of these covers the job you have in mind, probably we have one that does. Write us about your work and we'll try to help you.



There are no strings on this service. It's free, and you are under no obligation in accepting it.

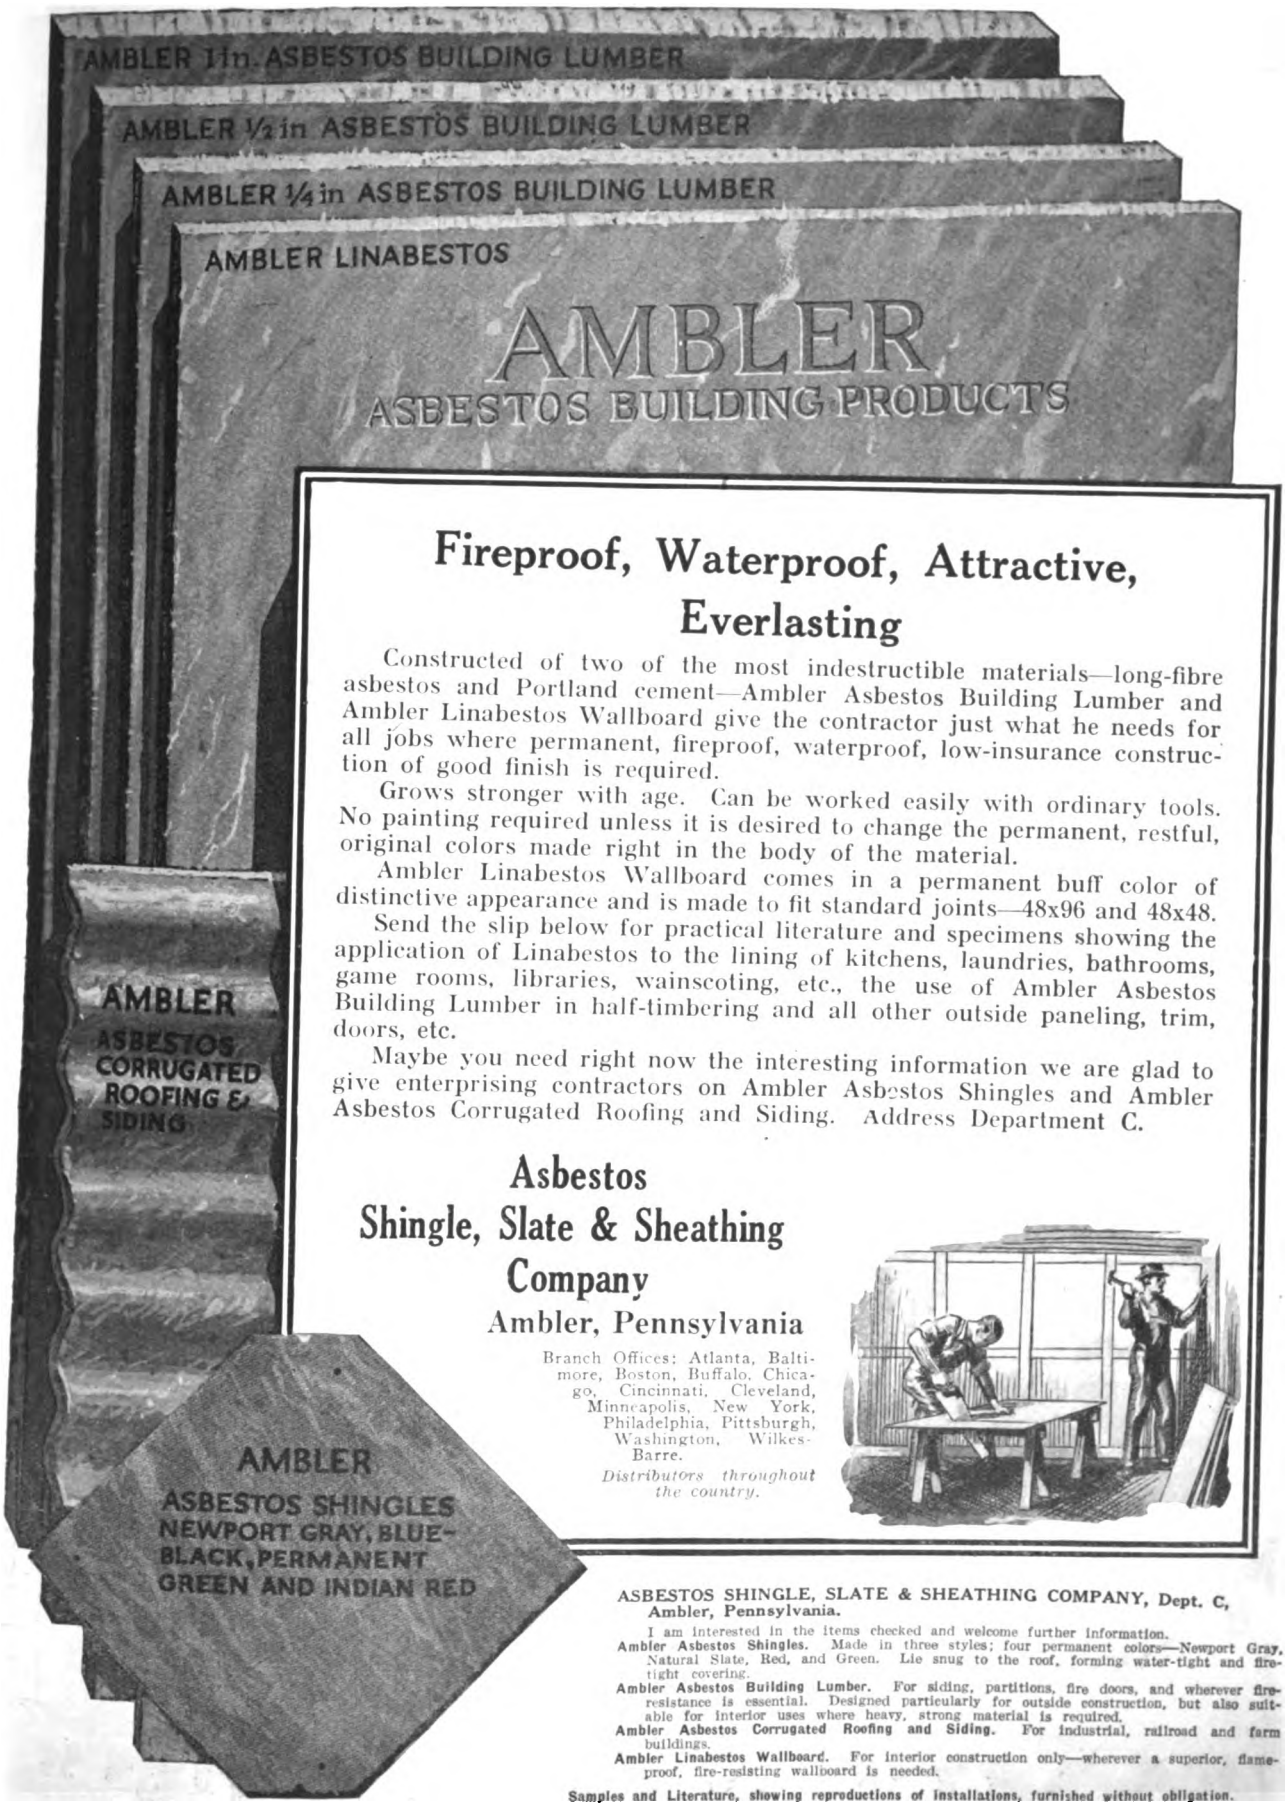
PRICE GUARANTEE, 1922



January first we resumed the practice of reducing prices on furnaces and fittings during the dull season, from January 1st, to May 1st. In normal and pre-war times this was always our regular annual practice. The prices during this period are the YEAR'S LOWEST RATES, and a saving can be secured greater than a whole year's interest on the purchase money. To make these rates attractive and to assure our friends that this means a REAL SAVING, WE AGREE AND GUARANTEE, that if, before October 1st, our prices shall be reduced below these dull season rates, we will refund to each purchaser, buying for delivery before May 1st, the amount of such reduction from the price charged him. This guarantee, in purpose and effect, will give to the dull season purchaser of a Hess Furnace the benefit of the lowest prices we shall establish before October 1st.

Fireproof, Waterproof, Attractive, Everlasting

Constructed of two of the most indestructible materials—long-fibre asbestos and Portland cement—Ambler Asbestos Building Lumber and Ambler Linabestos Wallboard give the contractor just what he needs for all jobs where permanent, fireproof, waterproof, low-insurance construction of good finish is required.

Grows stronger with age. Can be worked easily with ordinary tools. No painting required unless it is desired to change the permanent, restful, original colors made right in the body of the material.

Ambler Linabestos Wallboard comes in a permanent buff color of distinctive appearance and is made to fit standard joints—48x96 and 48x48.

Send the slip below for practical literature and specimens showing the application of Linabestos to the lining of kitchens, laundries, bathrooms, game rooms, libraries, wainscoting, etc., the use of Ambler Asbestos Building Lumber in half-timbering and all other outside paneling, trim, doors, etc.

Maybe you need right now the interesting information we are glad to give enterprising contractors on Ambler Asbestos Shingles and Ambler Asbestos Corrugated Roofing and Siding. Address Department C.

Asbestos Shingle, Slate & Sheathing Company

Ambler, Pennsylvania

Branch Offices: Atlanta, Baltimore, Boston, Buffalo, Chicago, Cincinnati, Cleveland, Minneapolis, New York, Philadelphia, Pittsburgh, Washington, Wilkes-Barre.

Distributors throughout the country.

ASBESTOS SHINGLE, SLATE & SHEATHING COMPANY, Dept. C, Ambler, Pennsylvania.

I am interested in the items checked and welcome further information.

Ambler Asbestos Shingles. Made in three styles; four permanent colors—Newport Gray, Natural Slate, Red, and Green. Lie snug to the roof, forming water-tight and fire-tight covering.

Ambler Asbestos Building Lumber. For siding, partitions, fire doors, and wherever fire-resistance is essential. Designed particularly for outside construction, but also suitable for interior uses where heavy, strong material is required.

Ambler Asbestos Corrugated Roofing and Siding. For industrial, railroad and farm buildings.

Ambler Linabestos Wallboard. For interior construction only—wherever a superior, flame-proof, fire-resisting wallboard is needed.

Samples and Literature, showing reproductions of installations, furnished without obligation.

JAEGER MIXERS

Jaeger-Mixed, Jaeger-Placed —that's Profitable Concrete

IN every kind of concrete construction, every cubic foot of concrete should show a definite percentage of profit. Mix it in a Jaeger and you mix it speedily and economically. Place it with a Jaeger placing plant and you get it where you want it—quickly and at low cost.

The Jaeger Placing Plant was designed and perfected to eliminate all possible labor in placing mixed concrete in forms such as foundations, abutments, slabs, floors, roofs, arches, etc.

The Jaeger Placing Plant can be put up or taken down in less time than is required to put up and take down wheelbarrow runs. The power to operate skip car is taken from the mixer hoist.

On any piece of work that requires placing of concrete, the Jaeger Placing Plant will do the job ***in less time, at less cost and with greater profit to you than any placing plant made.***

Jaeger makes 18 different mixer outfits—the most complete line of mixers offered under one name. No matter what class of concrete work you do—there's a Jaeger to fit your needs. And you will find in every Jaeger outfit the same high standard of mixer quality, the same expert engineering—the result of our many years' experience in building this popular, reliable line of mixers. Write today for complete information.

Standard Frames of Genuine White Pine

FOR CENTURIES, white pine has been preferred for all out-of-door uses. This preference is based on the knowledge that white pine endures under the most rigid weather conditions without warping, swelling, shrinking or rotting. No other lumber has the enduring qualities that are found in white pine.

All the exposed portions of the Andersen White Pine Frame are made of America's finest building lumber—Genuine White Pine.

When an Andersen White Pine Frame is nailed in place it will remain as long as the house stands.

Andersen Frames are made in 11 standard sizes from which the dealer can supply 121 sizes of window frames without delay by simply interchanging heights and widths. Each frame is packed in two compact bundles containing seven units. Using only a hammer, these seven units can be nailed up in ten minutes, making a complete frame with pockets and pulleys in place.

Leading builders find that Andersen Frames cut building costs, eliminate delays and give complete satisfaction.

Can a "Box" House be Artistic

Here Are a Few Excellent Examples of What Can Be Done to Obtain a Pleasing Exterior Design

HOUSES lacking good design are the fault of the designers. Artistic designs are possible for the plain rectangular houses that are referred to as "packing box" architecture; far too many awful examples are to be seen in nearly every community.

Now there is no reason why a "box" house cannot have a pleasing appearance and in this issue are shown several examples of good design. It all lays in the proper selection of material, the arrangement of doors and windows, roof projection, porch treatment, etc. Take these little features away and we have nothing left but a "box."

A careful study of the designs shown in this issue reveals the important part that little features play in producing good looking houses.

A square or other rectangular house is favored by many, they cost less to erect and keep warm. They give the maximum amount of floor area for the minimum amount of exterior wall. The trouble has been that such structures have usually been devoid of all beauty.

The pleasing house design shown above is nothing more nor less than a box, yet how different it appears. Note particularly the round dormer, it is something different. The two upper windows—the shutters make them appear wider, and the flower boxes on brackets add just a touch of ornament.

The bay window breaks the flat wall surface besides forming a striking interior feature. The front entrance porch is dignified and pleasing and the side pergola covered porch takes away from the square look. Note how the wall surface has been broken by the introduction of a belt course. All in all we have here a very artistic "Box" house.

Well Arranged Brick Home

The House Shown on the Front Cover is an Excellent Example of a "Box" House With an Artistic Exterior

BRICK lends itself very pleasingly to a Colonial house of square design and the home shown here is the residence of Mr. Alexander C. Shand, built at Narbeth, Pa., from plans prepared by Messrs. Wallace & Warner, architects of Philadelphia, Pa.

The principal feature is the colonial doorway with its sidelights, through this one enters direct into the living room.

The sills of the windows are of white marble and the lintels are of brick set on edge in flat arch form. The first floor windows have solid paneled wood shutters and those of the second floor have movable slat shutters.

Ornamental lattice flank each side of the front entrance and fill up the large brick spaces, there is also a similar lattice between the front window and right hand side of the house.

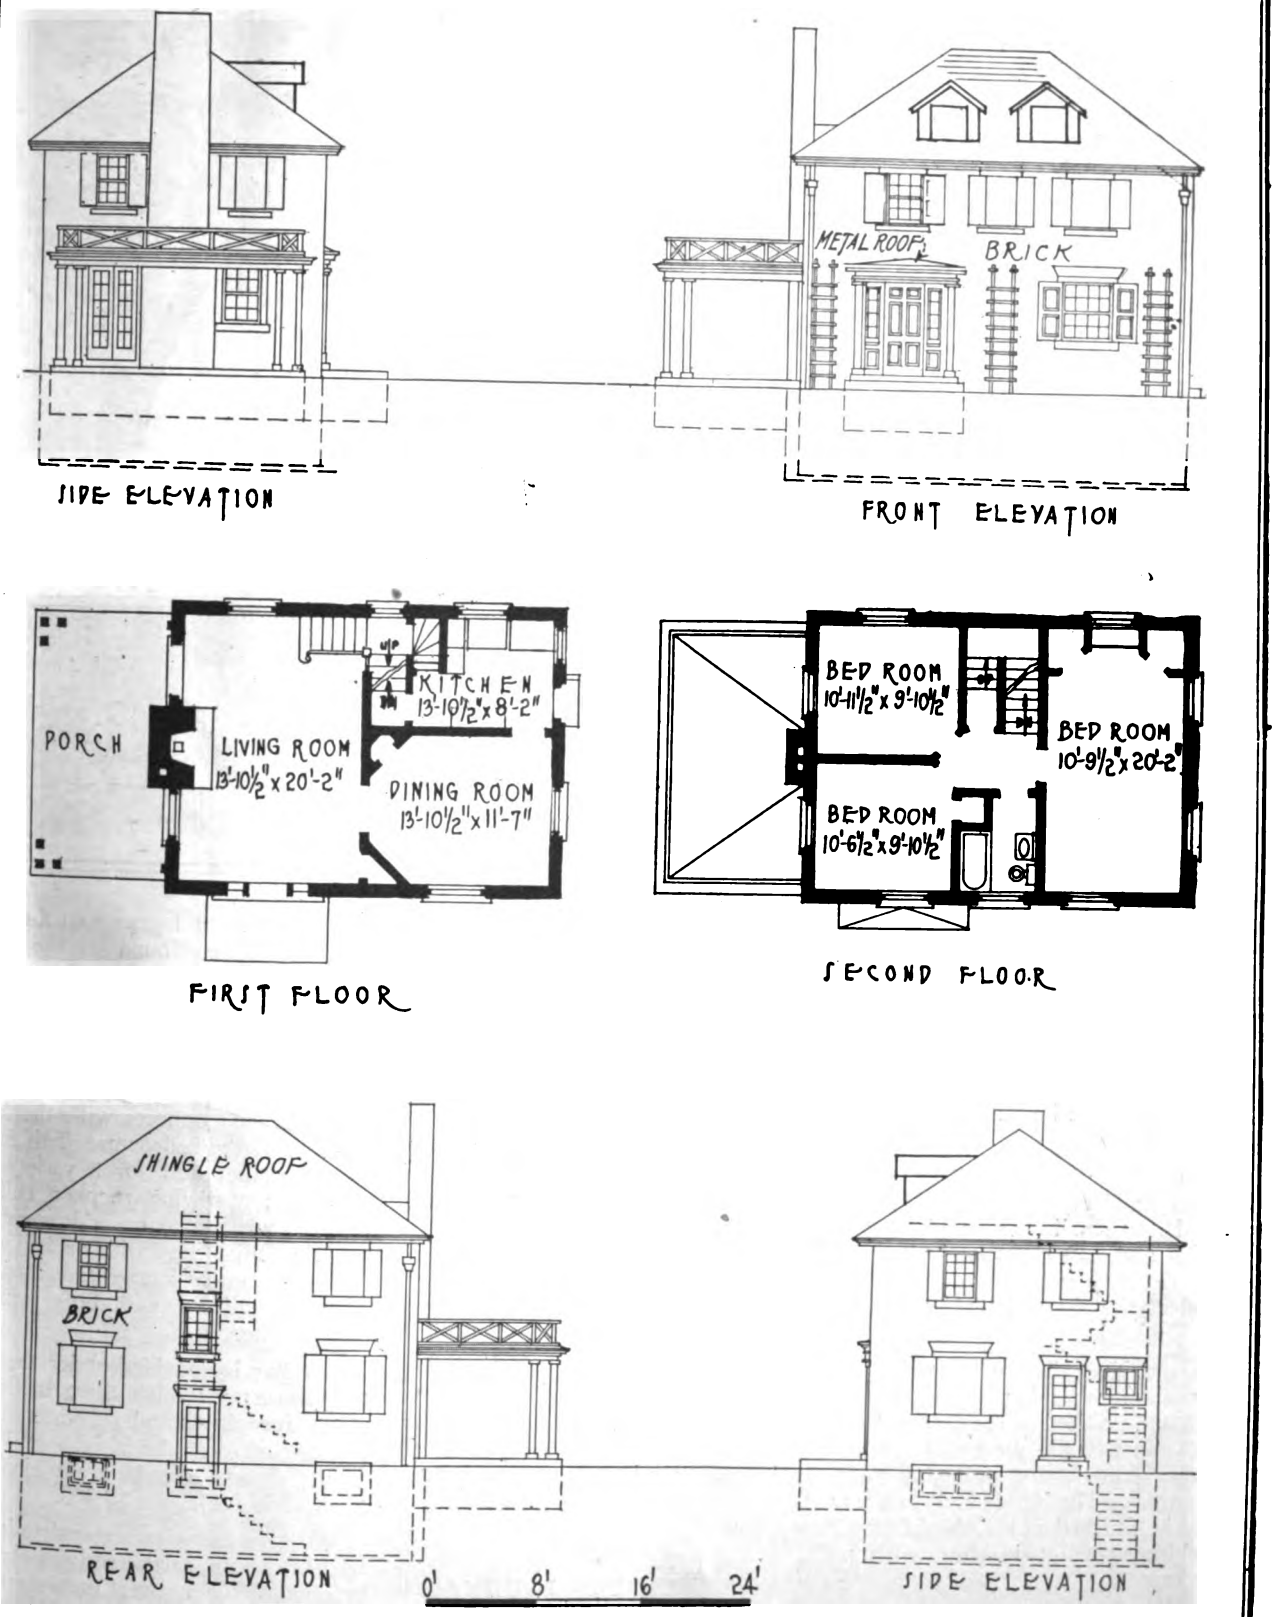
The side porch is supported by plain, round Colonial columns, the porch floor is of cement topping on a concrete base. The roof of the porch is covered with canvas and forms a balcony which is railed off with a pleasing diagonal design rail.

The outside brick chimney forms a well marked feature of the entire design. The hipped roof has its overhang well proportioned. Wood shingles have been used as the covering, although other kinds of roofing would have served the design just as well. The outstanding feature of the roof are the twin dormers in front.

All the trim including gutters and leaders are painted white, this contrasts effectively with the red brick, and the shingles are stained moss green. One can imagine the pleasing appearance presented by the house in its setting of green grass and trees.

The interior is very conveniently arranged for the needs of a small family. Living room, dining and kitchen are on the first floor, three bedrooms and bath on second floor and two extra rooms can be finished off in attic.

One enters the living room direct from the front entrance; at the right is a stairway of Colonial design, this leads to a platform from which one descends to the kitchen; this arrangement enables the housewife to go upstairs from the kitchen without going through the living room.



At the left side of the living room there is an open fireplace with a Colonial mantel. French doors open to the side porch which really forms a sort of out door living room.

The dining room has a corner china closet in true Colonial style with door having semicircular top, the other side is slanted off the same distance so as to correspond.

New England Colonial House

FOR those who like the New England Colonial type—and this type is rich in possibilities for refined houses along simple, dignified lines—the house shown herewith will at once offer a strong appeal. It is another example showing that a "box" can be made attractive.

The broad straight front, unbroken roof, delicate entrance porch with benches and lattice, large windows divided into small panes with heavy muntins and, last, but not least, the finely detailed entrance doorway—all reflect the old Colonial spirit of New England.

The outside walls are covered with heavy shingles laid with wide exposure and finished in the old "whitewash" effect, while the roofs, which are also shingle, are stained a rich moss green. The blinds and shutters should be finished in a Colonial blue, the chimney painted white with a black cap.

The above scheme gives a very striking effect in contrast with the green lawns and the planting, and a house thus finished always appears neat and refreshing. Of course where preferred wide clapboards may be used.

Having considered the exterior in detail and—by the way—we must not forget that an attractive exterior counts for much, since to most people our house is viewed only from the outside, we enter in, where we must live and entertain our friends.

The interior carries out the simple refined treatment suggested by the exterior; the house is Colonial throughout. The ceilings are moderately low, giving a cozy and homey atmosphere to the rooms.

A central hall with a large living room on one side and the dining room, kitchen and pantry on the opposite side, are found on the first floor.

The second floor shows a very convenient arrangement with three good sized bed rooms, a bath and abundant closets. An alcove room is also provided which connects with the hall and one of the bedrooms. This little room can be used for a variety of purposes; a sewing room, a child's room, a writing room, or it could be used in conjunction with the hall as a retiring room or lounge and fitted up very attractively with sofa, chairs and the like.

A cellar is provided under the entire house; in which there is ample room for the laundry, heater, coal storage, etc. In the vicinity of New York this house can be erected in first class style for about $8,500.

We give opposite a complete itemized bill of materials required for the erection of this house. Complete plans and specifications of this New England Colonial Home will be furnished for a nominal sum by BUILDING AGE and THE BUILDERS JOURNAL.

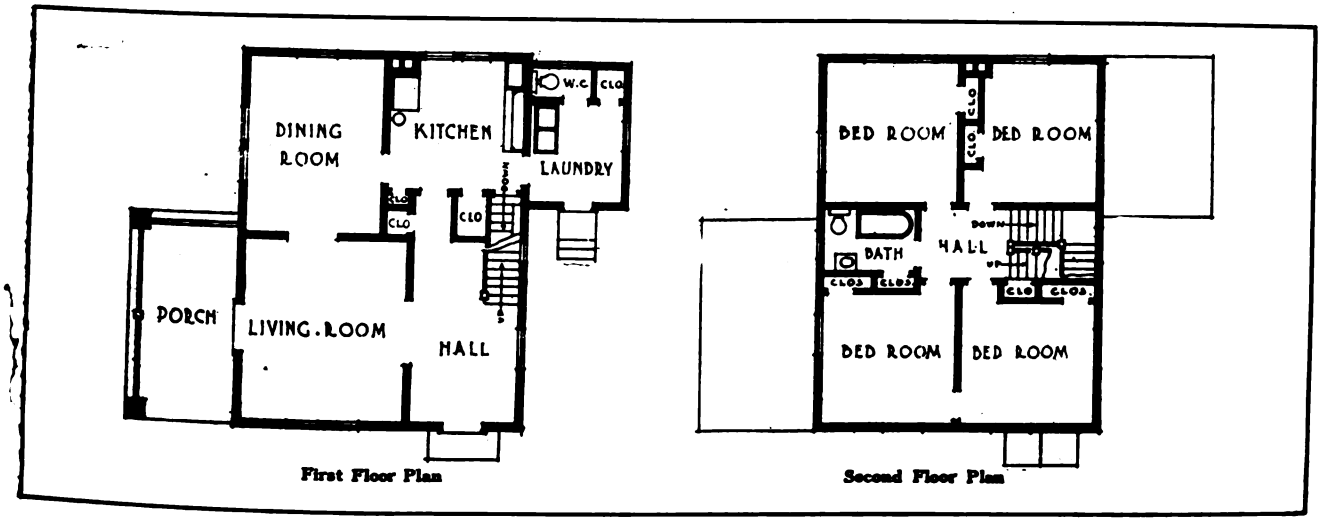
Artistic Cottage of Stucco and Shingles

Interesting "Box" Design by Schermerhorn & Phillips, Architects



THIS small home will appeal to those who like a "box" type but want something distinctive and artistic in design. It was built at Willow Grove, Pa.

In this house the architects have added the little touches that lift it out of the ordinary—note the hooded entrance, the porch treatment, the gable, etc. Using stucco for the first floor and shingles above gives a pleasing contrast.

The rooms have been grouped for convenience. One can enter the living room from the porch. There is a large reception hall connecting with living room and entered from the front door. A coat closet is conveniently reached from the reception hall.

A separate laundry extension on the right side is an innovation as it will have more uses than just for mere laundry work—it serves practically as an enclosed side porch.

The bedroom arrangement is very convenient—each room being provided with a closet. All bedrooms and bath open from a square central hall. The attic contains two large rooms.

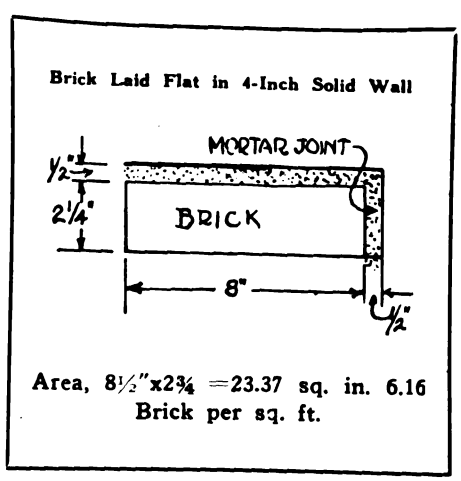
HOW TO ESTIMATE BRICKWORK

Practical Pointers on Figuring Quantities and Labor

By WILLIAM CARVER, Architect

NO thoughtful person can fail to be impressed by the tendency among the building public to turn more and more from the perishable type of construction now generally used and to demand more enduring buildings, which save much in upkeep and in fire insurance premiums, are cooler in summer and assure the thriftiest use of fuel in winter, preserve their market value indefinitely and are a better investment. This movement is also in line with the urgent necessity for stringent conservation of our forest products, as made evident by the Senatorial investigation last year and by the present extensive agitation for reforestation.



Chief among the better materials to which the public is turning is brick. This is only natural, for brick construction is the standard by which all other types of masonry may be measured. That such-and-such a material is "as good as brick" is a claim often read in advertisements. Its venerable history, its test by actual use under every conceivable condition and during periods up to thousands of years, its characteristic beauty which warms and mellows with the passing years, are reason enough for the general public, in which, after all, there is a strong appreciation of better things, inclining more and more toward this material. Moreover, brick now has its spokesmen who are drawing the attention of the people to the advantages of brick construction in the advertising pages of innumerable magazines and newspapers.

A contractor who is acustomed to turning out buildings on non-permanent construction and who tries to dissuade a customer from building a brick home by giving offhand an almost prohibitive figure for its construction, is making a great mistake. If he succeeds in his attempt to build a less enduring building, it will be borne in upon the purchaser more and more as time goes on that his reasons for wahting a better home were correct and the reputation of the builder will suffer. Satisfied customers, in any line, are the basis of success. The wideawake contractor is now making

himself familiar with methods and details of all types of permanent construction. He is learning that, after all, the estimating and building of masonry structures is no more difficult than is dealing with the construction with which long use has made him most familiar.

In giving a rough estimate of the comparative costs of a house in two or more types of construction, the

contractor should remember that the great majority of the work in the house will cost exactly the same, no matter whether the house is of brick, frame or any other construction. The foundation walls, chimneys, floors, partitions, millwork, roof, wiring, plumbing, heating, tinwork and many other items will show the same cost, the only difference being in the exterior enclosing walls, and that only above the first floor line. Data gathered by the American Face Brick Association from various sections of the country over a number of years, indicates that the total cost of a brick house averages only about 7% over the more ordinary type of construction, a difference of only $350 on a $5,000 house. It may be noted here, however, that the new brick Ideal wall, developed in recent months, reduces the cost of a brick house to such an extent that it can now compete in price with many forms of construction, but for the present we will figure the old type of brick building.

The carpenter contractor wh would equip himself with informatio so that he can readily figure brick construction should be warned, however, that too many small mason contractors use estimating methods that are out of date and inexact.

Of course, on a small job, an error or inexactitude in taking off quantities may not be a serious matter, but on larger work or where figuring is close the contractor should have a system so that exact costs and definite profits can be figured and thus eliminate uncertainty as far as it is possible to do so. To illustrate,—some mason contractors figure 7 to 7½ bricks per square foot of four inch wall thickness of solid brick wall. Anyone who will take the trouble of figuring out the square foot area of a standard brick (which is 2¼"x3¾"x8") plus the usual ½" mortar joint, will see that it is impossible to get more than 6.16 brick per square foot of area, especially in view of the fact that there is practically no waste when using brick. Every bat and broken brick can be used in the wall. On a large job, the cumulative effect of

Digitized by Google

this error would be serious and would result in the ordering of about 16% more brick than needed, not to mention the figuring in of items for handling and laying the extra brick and the cost of extra mortar. There is a similar unfortunate practice often followed when figuring openings, some contractors deducting only a certain proportion of the area of the wall figured as solid, the theory being that the extra amount of brickwork figured in will pay for the cost of forming the opening. A better way than this is to deduct the full area of each opening, including the space occupied by the window box for a double hung frame, and make a definite allowance for forming the opening. Similarly, some contractors do not deduct openings of less than a certain area—sometimes ten square feet, but it is easily seen that this practice would result in considerable inaccuracy on a job where a number of such openings occurred. The full thickness of the wall is also frequently figured for the full girth of the building; and again, in this case, the theory is that this gives an allowance for the extra cost of forming the corners. It is apparent that in a four cornered building, with an eight-inch wall, a length of thirty-two inches times the height of the wall is thus figured in excess of the actual quantity of material and labor required.

The modern way of estimating brickwork is to figure the actual amount of brick, mortar, etc., needed and base the estimate upon a unit cost which will cover the forming of the openings and corners shown on the drawings. Very few buildings are constructed with plain walls without any openings, and the rate of laying

A Corner of House with Ideal Wall

brick is always averaged from jobs on which the usual number of openings occur. The best method is, therefore, to first look over the plans and specifications to determine the class of workmanship desired, the bond, joint and kind of mortar in which the brick is to be laid, whether or not the usual number of corners and openings are shown and fix the unit cost accordingly. Special items requiring extra labor can then be added as necessary.

Some contractors take off quantities of brickwork by reducing all the work where footings go to various brickwork to cubic feet and for larger depths, where walls vary in thickness and where the brickwork is in irregular masses, this is probably the best method.

On smaller buildings, such as residences, where most of the brickwork occurs in walls of two thicknesses only (apart from chimneys and porch piers) it is generally more convenient to determine the area of the walls of each thickness and either to multiply these areas by the number of brick required per square foot or to read off the quantities from tables which are now available.

Another matter upon which practice varies is that of determining the number of face brick—where such are used — and their increased cost over the cost of the common brick backing. Some contractors determine the number of common brick and face brick separately, figuring the cost at different unit prices. Others figure the entire wall as a common brick wall, adding the increased cost of the face brick and the laying of the same as an extra item. The latter is probably the best method and makes for simplicity and accuracy in figuring. Where the face brick are bonded into the backing with headers, these should, of course, be allowed for in addition to the brick in the outer course.

In actually figuring a job a form is used which is ruled to denote the "in" items on one side and "outs" on the other. The square foot areas of the exterior wall 8" thick above the first floor line would, for instance, be placed under the "in" heading, while under the "out" heading would appear the areas of the window and door openings. The brickwork displaced by stone trim, by the weight boxes of double hung windows and other such items should be allowed for and material and labor deducted for the same. In the "in" column, however, is included any extra material and labor necessary for particular items. This system, carried out thoroughly on a few jobs, will enable costs to be determined very closely, especially if a record is kept of the

Erecting a Brick Building with Ideal Wall Construction

Digitized by Google

actual cost of each item and checked over with the estimate.

In figuring fireplaces and chimneys, the quickest way is first to figure them as solid brickwork, afterward deducting the brickwork displaced by flues, fireplace openings and ash pit. Tables are available for figuring the material in chimneys, also in porch piers, the tables showing the material needed per foot run.

In figuring the labor, it should be remembered that bricklayers are now quite up to their pre-war production. In the data which follow the bricklayer production is figured on a very conservative basis, and from all sections come advice that these production figures can safely be increased.

In figuring an Ideal wall job, no furring or lathing need be included, plaster being applied directly to the brickwork.

Where brickwork is to be cleaned down, an allowance for this item should be made, also for mortar color, foreman where one is employed, and on large jobs the overhead or rental cost of hoisting machinery, engineer's time and fuel for same.

Material and labor for one square foot Ideal all-rolok wall 8" thick: 9.035 brick (of which 6.023 appear upon the face); .08 cu. ft. mortar, .061 hrs. laborer's time; .076 hrs. bricklayer's time.

For one square foot solid wall in common bond: 12.705 brick, .135 cu. ft. mortar, .093 hrs. laborer's time; .084 hrs. bricklayer's time, if wall is laid in lime or cement-lime mortar. Where the mortar is cement mortar a little extra bricklayer's time should be figured for this mortar is a little less plastic. .092 hrs. bricklayer's time per sq. ft. is a fair allowance for cement mortar.

Where the Ideal wall is used the cost of construction of a brick home or other building is brought down so that it can compete on an equal first cost basis with any other construction.

By laying brick on edge instead of flat, a hollow wall is formed which has the important advantage of having no through mortar joint and which has a very slight current of air circulating in the interior. Moisture, even under severe practical conditions, cannot be conducted the length of a header brick by capillary attraction and the slight circulation of air helps to keep the header dry. It is therefore practical to plaster directly on the brick without the use of furring. The Ideal wall is the only type of masonry wall so far developed in which furring can be safely omitted. Practice has proved this wall, plastered directly on the brick, to be entirely satisfactory wherever used.

Will Machine Mixed Mortar Pay on Small Jobs?

By A. NYDEGGER

LIME mortar is one of the oldest known building materials, having been used long before the Christian era. Until very recent years, the ancient method of mixing, namely, with a hoe in a mortar box has survived for many centuries. In fact, it is surprising to note how many contractors are still using this antiquated method even on comparatively large jobs.

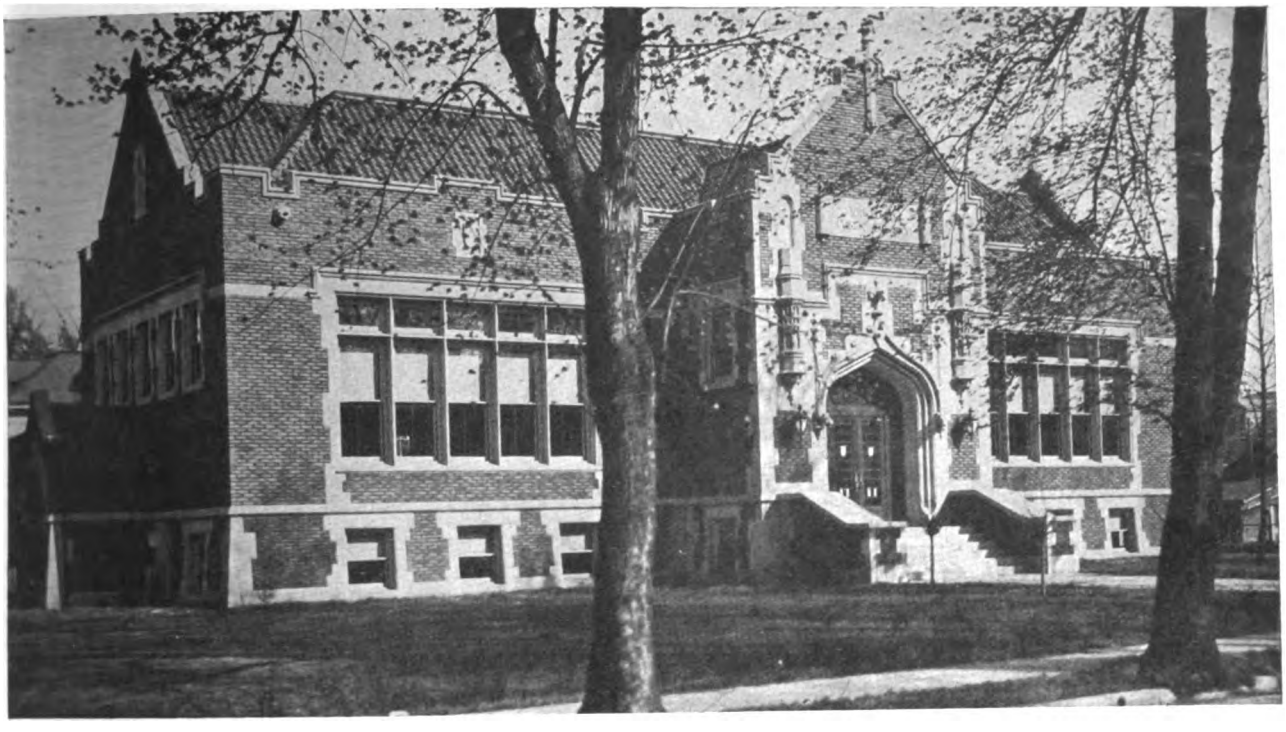
In the last few years, mortar mixing machines have been developed for mixing lime and cement mortar which are so practical and which have so many advantages over hand mixing, that one wonders why they are not used universally on every brick job.

One good form of machine is the continuous mix type, consisting of a long trough or drum with a revolving shaft carrying the mixing paddles running thru the center. The slacked lime and sand is shoveled into one end of the drum and the pitch of the paddles acting as a screw conveyor carries the mixture to the other end, thoroughly mixing it on the way. The proper tempering is done while the mortar is in the machine, so that when it is discharged at the far end of the machine into a box or wheelbarrow, it comes out in a smooth, putty-like mass in perfect condition for the brick-layer.

Machine mixed mortar effects a saving for the contractor in many ways over hand mixed mortar. Because of the thorough mix given it by the machine, up to one-third less lime can be used and still produce as strong a mortar.

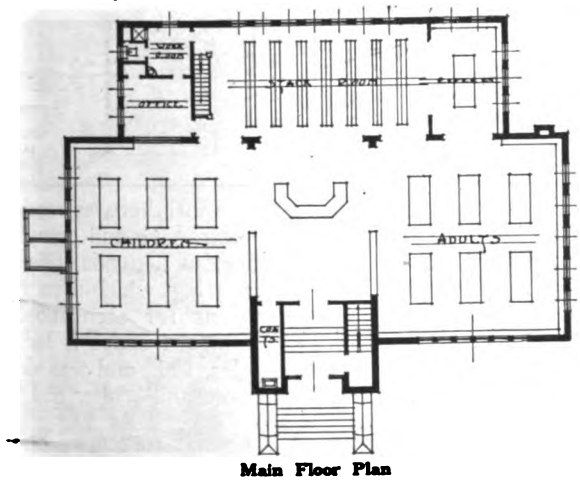
One man with a machine can mix mortar enough for twenty brick-layers, therefore reducing the labor to less than 25% of that required for hand mixing.

Owing to the smooth consistency of the machine mixed mortar, the brick layers can lay approximately 10% more brick.



During the hottest days of the Summer it is often physically impossible for a laborer to pull a hoe, thus shutting down the brick-layers for lack of mortar. The machine is unaffected by heat and the job is not held up. This of course reduces the contractor's overhead expense, increasing his profit. Furthermore, he can complete his job in less time, enabling him to take on more work and increase his volume of business.

The question often arises as to how small a job it pays to use a machine on. A brick job of three hundred thousand brick will warrant the contractor in purchasing a machine if he does not already own one. After he has the machine, it will pay him to use it on a job of fifty thousand brick or less. Many contractors now using machines claim it pays to use them on two-family flat buildings requiring twenty to thirty thousand brick.



The time is fast coming when contractors as well as manufacturers must cut all the corners possible and take advantage of every possible means to reduce cost of production.

The use of a machine for mixing his mortar will go a long way towards making the mason contractor the successful bidder on a job and insuring him a profit when the job is completed.

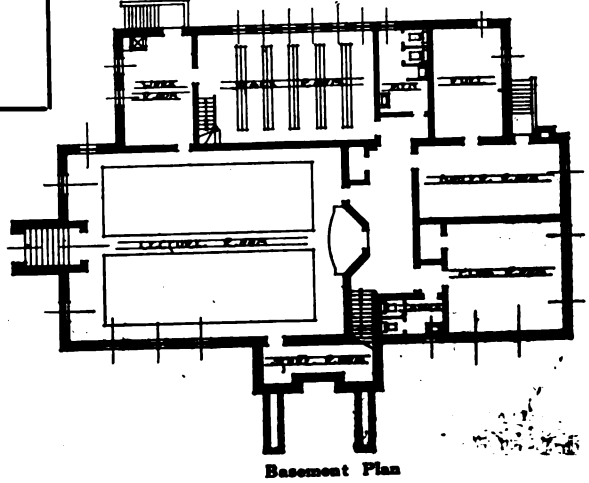
Public Library of Gothic Design

Main Floor Plan



LIBRARY buildings reflect the intelligence of a community; where one sees a good library it is an indication of a good town. Vincennes, Ind., can boast of an artistic public library which was erected from plans drawn by John Bayard, architect, of the same city.

The building is constructed of brick with limestone trimmings, the architecture following the Gothic style. The library proper consists of two reading rooms, one for children and the other for adults, with a stack room and office in the rear addition. The basement contains additional stack space, lecture room and club room, besides toilets and heating plant. The lecture room is reached by a separate entrance direct from the street as well as from the library proper.

The entrance doorway is a beautiful example of Gothic work. The double doors are glazed with leaded glass, as are also the two side lights and transoms above.

The reading rooms are exceptionally well provided with windows. The attendant is at a desk located opposite the central entrance so that a view of both reading rooms, stack rooms, etc., can be had from this central point.

The roof of the building is covered with tile. It is a combination of hip and gable end, as will be evident from the photo.

Row of Stores

Novel Bungalow Designs

By CHARLES ALMA BYERS

THE accompanying illustrations show a row of small stores, all joined together in a continuous string, designed to suggest the French village plan. Although they are all built in a solid row, each little shop has its own separate entrance, and in roof designing and other details appears to have been created as an individual building. In the row are a total of nine stores and one office and studio section, the latter being the place of business of the architects and builders of the string.

The buildings are of frame construction, several of them have their exterior finished with wide redwood siding, while the others have exteriors of cement stucco. The color scheme, as to the walls and trimming, varies. The roofs are of wood shingles, in variagated colors.

The offices and studio of the architects and builders are set back several feet from the sidewalk, and the space thus left in front is carried out in attractive garden style, with a brick-edged lily pond as a feature.

The interior woodwork consists of Oregon pine throughout, which is stained in different colors in the different divisions, and all walls are plastered and attractively tinted. The ceilings are variously designed, some of them being vaulted in different styles and others being flat. Each unit is equipped with sink and toilet, and otherwise made practical and attractive and complete.

A basement extends underneath the entire string, which is partitioned into divisions for each shop.

This string of shops is located in Los Angeles, Cal., and was designed by Pierrepont and Walter S. Davis

BUSINESS GETTING METHODS

Ideas that have worked for others

How to Create Building Business

Instructive Advertising Campaign of a Progressive Lumber Company Benefiting Local Builders and Themselves

By J. E. BULLARD

THERE is a vast difference between advertising to the contractor and advertising for the contractor. For seventy-four years the L. Vaughn Co., of Providence, R. I., did the former. A few months ago it began to do the latter.

Established in 1847 this company did no advertising except in such mediums as the "Chamber of Commerce Journal," and the "Builder's Guide," up to 1921 and the advertising it did to the contractors consisted merely of announcement. Yet this company has always done a prosperous business and even though it did build an addition to its plant a couple of years ago there has been a great falling off in building it still could probably get along very well without advertising.

This company, however, though an old company is a progressive company and has observed that during the past twenty-five years jobbers and manufacturers in nearly every industry have been able to increase their prosperity by assisting in building up the business of those to whom they sell. If this has been done in other industries why can it not be done in builders finish?

It is just possible that the falling off in building that has taken place has been due in no small degree to the fact that not so much effort has been given to selling the idea of building and repairs as has been given to selling silk stockings, automobiles and safety razors.

A great many home owners really need only a suggestion to start them remodeling or even building. With these advertisements coming before their eyes there is a constant suggestion to go ahead and build. If no suggestion is made to them, however, they are pretty sure to spend their money for silk stockings, safety razors and automobiles and all the building they will do will be a garage for the automobile. As a matter of fact these days there are far more automobile garages being built than any other kind of buildings and perhaps this is due to the automobile industry using such strenuous methods to sell cars.

In each advertisement the L. Vaughn Co. is running there is a sketch of some product the company sells, and the sketch shows how the product will appear in the home.

How Three of the Advertisements Appeared in Local Papers

Improvement in Construction Industry

Opinions of Delegates at Annual Convention of Associated General Contractors of America. Encouraging Outlook for Business Revival This Year

A DEFINITE assurance that construction recovery is under way and that it is the first phase of a general business revival sums up the results of the construction conference held in Cleveland, January 17 to 19 by the Associated General Contractors of America. Evidence of this fact, both statistical and informal, abounded in the discussion of the delegates and in the papers presented as a part of the program.

Col. Leonard P. Ayres, who was chief statistical officer of the A. E. F. and who is now vice-president of the Cleveland Trust Co., expressed the belief that prices will continue to fall, intermittently, for ten or twenty years more, but conveyed assurance that the construction industry will be immune to many of the embarrassments of the coming period, because it supplies a market in which their is a latent demand equal to 2¼ years normal production of building.

"In other words," said Col. Ayres, construction can go along for nine years at 25 per cent. above normal and only fill the normal demand by the end of that time.

Financial Problems

Col. Ayres said that building finance problems had commenced to adjust themselves, through greater abundance of money. "The acrimonious discussions between yourselves as contractors and ourselves as bankers are about over," he remarked. "Within six months so much money will be for borrowers that owners will be able to arrange building loans on pre-war terms."

Elimination of Waste

Determined not merely to predict prosperity, but actually to observe it, the constructors arranged a program in which the theme of waste elimination was constantly emphasized.

J. Park Channing of Boston, who succeeded Herbert Hoover as chairman of the Federated Engineering Organizations, gave the major paper of the conference on this subject and said that 25 per cent. of the responsibility for waste rests on labor, 50 per cent. on management and the remaining 25 per cent. on outside relationships.

Cost Plus vs. Lump Sum Contracts

Cost-plus contracts, fee contracts and efforts made in some projects to eliminate the general contractor were discussed. D. A. Garber, of New York, voiced the belief that few architects and engineers can qualify to direct a building project in the place of the general contractor. Godfrey Edwards, of Los Angeles, decried anything but lump sum contracts, believing that when a builder takes a job on a cost plus or a fee basis, he is paving the way for his own elimination.

Idealism in Construction

By ARTHUR S. BENT

President Associated General Contractors of America

From Address at Convention

THE industry that we represent is not alone very great; it was the only hope of a shattered world lying almost in ruins only yesterday. Men may fight and destroy for a time, they can build forever, and the very continuity of life itself depends upon construction.

In thinking of our A. G. C. I have wondered if sometimes you thought that I was too much of an idealist. It is a profound truth that no institution can continue to exist without genuine moral worth. If that is true, then the measure of our vitality will be our moral worth. If the A. G. C. should ever stand for being served rather than serving, for having rather than being, for getting rather than giving, then it will cease to achieve any success that will be worth our time and effort.

But that has not and never has been the spirit of this organization, and please God it never will be! Victor Hugo tells us that the world lets everything die that is moved by selfishness, and the reason the A. G. C. is such a lusty young giant tonight is because it is inspired with a spirit of unselfish co-operation between ourselves, a desire to serve our public more worthily and a purpose to lift our craft to higher levels of integrity and honor.

There is a very beautiful legend, an impressive one, I think, so old that its origin is lost—I have never been able to discover it. It goes like this: Four men stood up with God when He made the world, and watched with wonder as the shimmering sphere flung from the fingers of Omnipotence, found the place in the shining galaxy of stars, and one of the men said, "How was it done?" And God said to him, "Go, find out for yourself." And that man went and became a scientist.

And the second man said, "What is it for?" And to him God said, "Go, find out for yourself." And he went and became a philosopher.

"Give it to me," the third begged. And to him God said, "Go, possess it for yourself." And he went out and became the business man.

The fourth said nothing but fell down and worshipped, and God said to him "You too, shall go and because your soul burns within you, you shall create beauty," and that man went and became the artist.

Now may we not, reverently and not unfittingly, add to this noble group of God's journeymen the constructor? We who forerun and always have all the others? We who have straightened the path for their feet? We, without whom their high destinies could not be wrought out and by whom all their visions are crystallized? We work and delve for science in its onward march, and harness its magic to ways of usefulness. The bewildering and marvelous structure through which business functions is the work of our hands. Philosophy leans upon us heavily to demonstrate its theories of life, and even to art we give its tools and make its dreams of beauty imperishable.

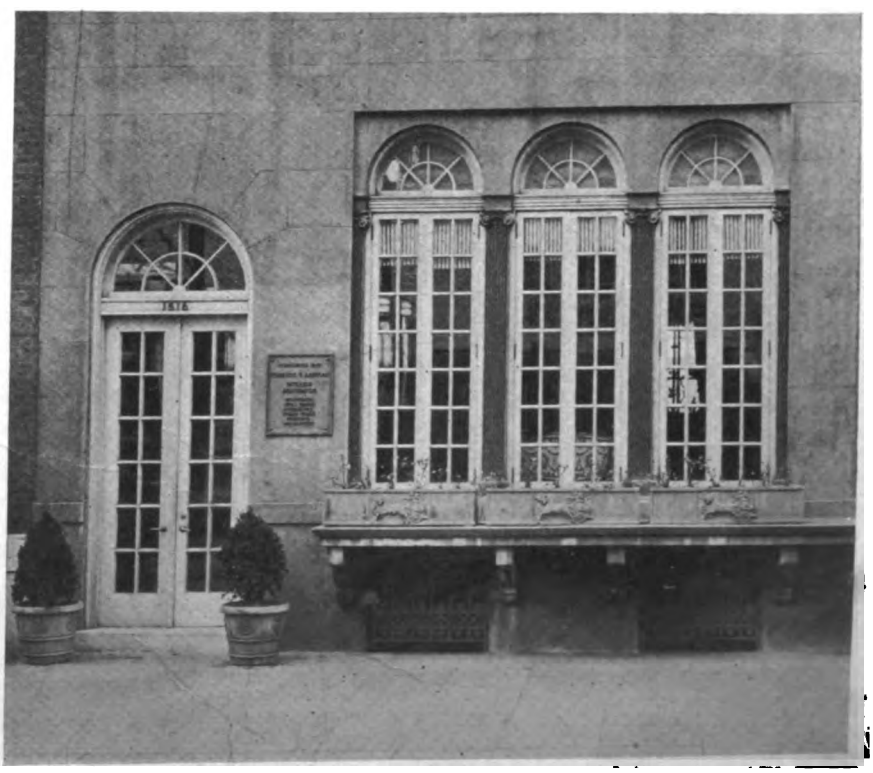
Remodeling Residence Into a Store

Interesting Example of Utilizing an Old Brown Stone House for Commercial Purpose

MANY a person has built a residence in a select neighborhood only to find that after a lapse of many years the residential district is gradually giving way to business. In many of our large cities this has often been the case and the owners of the house (usually being people of considerable means), do not care to live in the semi-business neighborhood, therefore, they give up their old residence.

One plan is to tear down the old residence and erect a modern business structure in its place. As the majority of houses are very well built, it is a bigger return on the investment to alter the residence to stores, lofts, or a combination of stores and small apartments. This is being done to a considerable extent in cities like New York, Chicago, Philadelphia, Boston, etc.



The illustration shown on this page are photographs of one of these well constructed brown stone residences located in Philadelphia on Spruce Street. The property was sold to a firm of interior decorators who wanted an artistic home for their business. They turned the commission for the alteration over to C. E. Schermerhorn, Architect, of Philadelphia, and the result of his work is shown in the lower picture. The remodeling follows somewhat along the Roman style of architecture but with Colonial modifications. The result is artistic and was done at a minimum amount of expense.

The two windows on the first floor were cut out and a steel beam inserted so as to carry the upper wall and a triple mullion window was put in their place.

The railing of the balcony was removed but the balcony retained, and this makes a ledge for holding the three Roman design window boxes.

The front "stoop" was entirely removed and the entrance cut down to nearly sidewalk level. The inner vestibule was removed and steps erected leading to the first floor. The original door opening was lowered so as not to have it out of proportion. Above the semi-circular top of the door opening a stone arch was formed, as will be noted by an examination of the lower picture.

Of course, there was considerable alteration in the interior of the house —partitions between the rooms were cut out so as to give ample display room for the new occupants.

MASONRY
Practical Information on Materials and Latest Construction Methods

Elevated House Approaches

By ALBERT MARPLE

ONE of the most difficult things a builder has to contend with is to obtain a good appearance to the approach of an elevated house.

Only the person who has erected a dwelling on a site which is a rod or so in the air knows the real "joys and heart throbs" of home building, at least, of the "elevated" type. This person like no other, also, is able to realize to the fullest extent how "perfectly thrilling" it is to climb from one to a dozen flights of steps, these arranged in zig-zag, criss-cross or circular fashion, about so many times every day, and this, generally, after climbing the long and steep grade from the nearest car line.

It's a safe bet that the person who insists on being able to view the surrounding cities from his basement window, must be willing to smile and shout "Hurrah!" when the thrills of building—and living—upon the top of a hill make their appearance.

An Arrangement That Looks the Best, as It Follows the Natural Slope of the Ground. When Shrubbery Has Grown It Will Look Natural and Form a Very Pretty Picture

There is no type of approach that is so hard to design as is that leading to the "elevated" home, while on the other hand no other kind of approach can be made so attractive by the employment of a little originality. This might consist of the actual shape of the width of the caps to these walls, of the grouping of the flights of steps, etc., in fact, anything that will give that "different" appearance which one should strive after. Yes, this is easier written than done, but generally, a little work will turn the trick.

The rise of the steps of the average approach is about seven inches, while its tread is something like ten inches. This is not a specified size for these steps, however.

To be on the safe side all walls along front of property and the sides of the approach that are over 5 feet high should be reinforced, ½-inch rods will be found of sufficient strength, placing them one foot apart.

Well Placed, But Too Many Steps in the One Flight—A Better Solution Would Be to Have Several Short Sweeping Flights

Not a Happy Solution of the Difficult Problem—There is Too Much Stone in Evidence and the Houses Are Too Near the Street Line

Announcement

THE publishers of *Building Age* have purchased *The Builders Journal,* and take pleasure in announcing the consolidation of these two journals under the title, BUILDING AGE *and* THE BUILDERS JOURNAL, beginning with this issue. The monthly schedule of publication will be maintained.

Subscribers to either paper will receive the consolidated publications until expiration of their subscriptions. Subscribers to both will have their subscriptions extended for a total of the two periods for which they have made payment.

BUILDING AGE has been published continuously every month since 1879—44 years. It is improbable that any other like period will see a greater improvement in building design and construction, and in the development of conveniences, although there will, of course, be changes in the use and application of materials, extension of labor saving devices in the structure itself and in methods of construction, etc., all of which will be a credit to the industry and a benefit to mankind. For during the past two score and four years ginger-bread and jigsaw designs have given way to the present sturdy types of structures, so truly representative of the country. The pump has been replaced by piped water supply; the privy by the modern bathroom, and the coal oil lamp by electric light. The automobile has come into being, bringing with it the private and public garage; the daguerreotype has developed into the motion picture film, and the theatre to present it; the school from a hated children's prison to a place where it is a delight to study and work, and the factory from a drear and depressing place to a building flooded with sunlight and every convenience and safeguard for the employee.

It would be fatuous to say that BUILDING AGE has been responsible for these changes. But it has done such yeoman service in the good cause, that it has been recognized everywhere as America's Standard Authority on Building Construction; it has been used as a text book in almost every well known school and college teaching architecture and building, and it is the most widely quoted building magazine in the world.

THE BUILDERS JOURNAL was America's newest building magazine. It set itself so high and enviable a standard as a quality publication that it quickly attracted to itself many thousands of contractors and architect-builders, who took it to the exclusion of any other paper.

THE union of these two magazines, in which the best features of each will be retained—this union of age, experience, conservatism, prestige and influence, with youth and virility—will make one journal better and stronger and more useful than any one building publication produced heretofore.

Advisor on Finance
WALTER D. STABLER,
Comptroller of Metropolitan Life Insurance Co., N. Y., who has the placing of mortgage loans aggregating over $100,000 to aid in reducing the housing shortage.

Editor-in-Chief
CHARLES G. PEKER
Registered Architect; Member New York Society of Architects; Author of "How to Read Plans," "Practical House Framing," etc.

Advisor on Construction
NOBLE FOSTER HOGGSON
President Hoggson Brothers, New York, builders of banks, office buildings, industrial villages, etc. Well known writer on building.

Advisor on Design
ROWLAND C. HUNTER
Registered Architect; Member of R. C. Hunter & Bro., Architects, New York. A recognized authority on the design of artistic suburban homes.

Board of Editorial Advisors

THE publishers of BUILDING AGE and THE BUILDERS JOURNAL have been fortunate in obtaining the cooperation of the recognized experts shown on this page, who constitute our Board of Editorial Advisors. Specific questions are invited, but they must in every instance be addressed to The Editor, not to any member of the Board. This is a service to our subscribers of the greatest value, and is in addition to the usual editorial service.

The publishers feel themselves fortunate, also, in their Editor-in-Chief, Mr. C. G. Peker. His work, as reflected in the columns of this paper, speaks for itself.

Legal Advisor
ARTHUR L. H. STREET
Attorney at Law. Expert in cases relating to the building industry. In charge of our Legal Department, giving advice to readers.

Advisor on House Painting
A. ASHMUN KELLY
Author of "Expert House Painter," "Expert Wood Finisher," "Expert Interior Decorator," etc.

Advisor on Contracting
ISAAC P. HICKS
Building Contractor, Omaha, Neb. Author of "Builders' Guide," "Estimator's Price Book," etc.

Interior Decoration
C. W. WILSON
A well-known expert in this line, formerly with Arts & Decoration, in charge of our home decorator's service department.

Real Estate Advisor

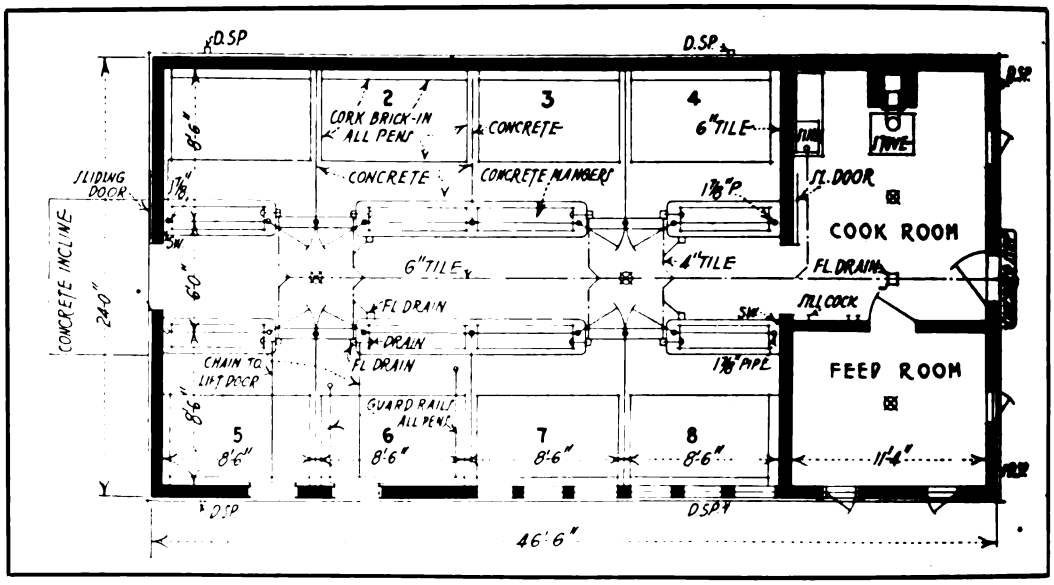
Model Kitchen Arrangement

NOTHING pleases a woman more than to have a well arranged kitchen having plenty of cupboards with shelf and drawer room. The picture shown above is that of a very well arranged kitchen and the plan shows the layout. One enters the kitchen from the rear porch, the garbage can may be taken out by opening a little door opening on to this porch and a receptacle is made for it in the space under one of the seats of the breakfast nook, so that it can be reached from kitchen.

This is an arrangement that keeps the garbage can both outside and inside, there is no need for the housewife to go outside in stormy weather, while the garbage can is not in the kitchen. Above this garbage can closet is another shallow closet to contain the ironing board; a convenient electric outlet is the means of attaching the electric iron. Here is a convenience that is so placed so as to receive plenty of light and whenever the ironing board is not needed it is simply folded up and the closet door closed, and it is out of the way. Besides holding the ironing board this closet is deep enough for the iron.



The breakfast nook is suitably arranged. The table may conveniently be used to serve a meal for four persons and during the day time it comes in handy as a place for preparing the meals, peeling potatoes, etc. Notice the electric outlet for the attachment of the electric toaster, grill, percolator, etc. A window a little above the level of the table affords plenty of daylight and a lamp on the ceiling affords the artificial light.

The sink is placed on the right hand side and it is set at a convenient height for the housewife with a large window above it. On each side is a drain board, both sides having cupboard below. A number of drawers are arranged so that there will be plenty of space to keep various kitchen utensils. Above each drain board and table there are cupboards, one on each side of the sink. These extend to the ceiling and afford convenient places for the various dishes, etc., that the careful housewife cherishes.

A range is conveniently placed in the corner where it receives ample light. A refrigerator is placed in the hallway leading to the cellar stairs.

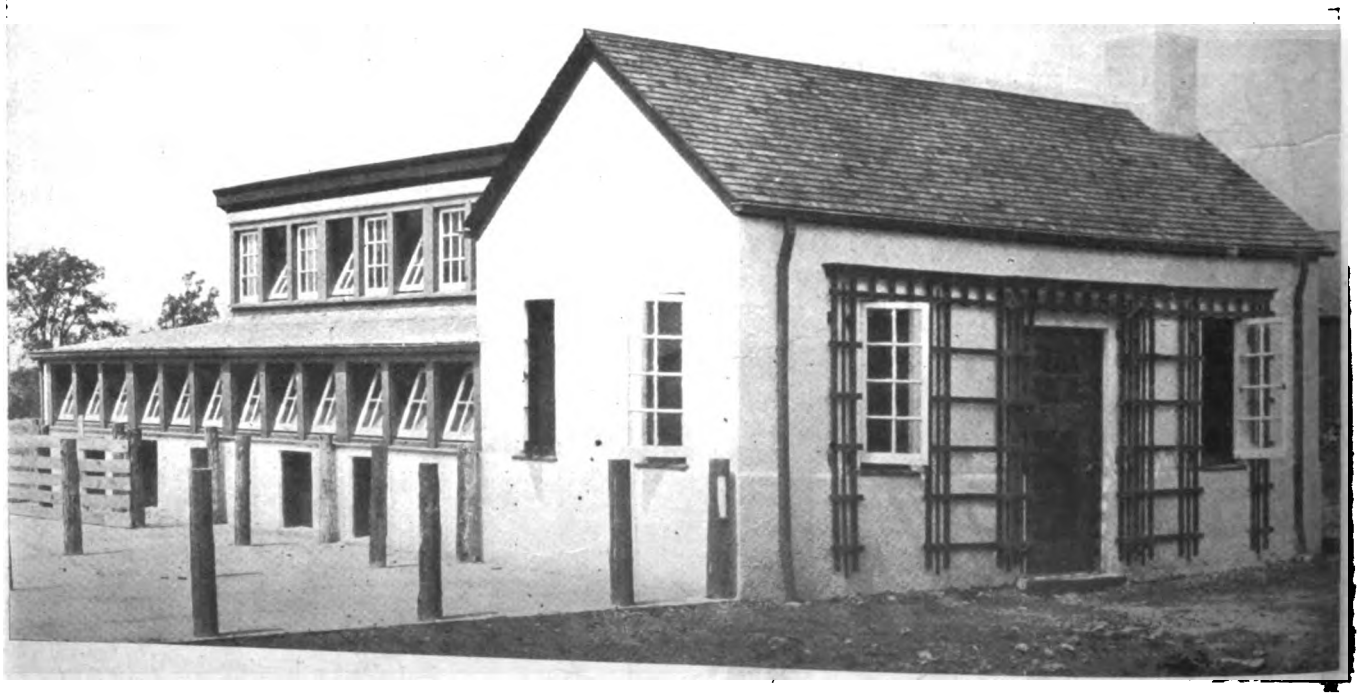
Artistic and Practical Hog House

ONE would hardly expect a hog house to have an exterior design that would have any architectural merit, but here is one that is artistic as well as practical.

This interesting hog house is located on the Morse Farm at Libertyville, Ill. It is built of hollow tile and stuccoed, and the interior of the blocks are also covered with cement plaster.

Below the window line 8-inch blocks are used and above 6-inch, the interior wall being flush, the offset being on the outside—a little feature that adds greatly to the appearance. Ornamental lattice on the front also enhances the beauty of the design.



Interior View, Showing Arrangement of Pens—Concrete Mangers Easily Reached Make Feeding Easy

The roof is of shingles except on the flat section which is covered with a prepared roofing. Rafters are of 2x4", covered with sheathing boards laid close and having sheathing paper under the shingles. The underside of the rafters is covered with metal lath and plastered.

A picture of the interior shows iron pen railings also concrete mangers. There is a concrete floor throughout, in the pens, a recess in the concrete floor is filled with cork brick, everything for comfort and health of prize porkers.

Other interesting details will be noted by an examination of the plan and picture.

An Unusual Design for Factory

CINCINNATI, Ohio, can boast of one of the finest factories in the world. One usually associates a factory with some sort of a dingy looking, prison-like affair, but there are very many excellently designed factories in most of our industrial towns, but most of these lack the picturesqueness that is found in the factory of the Gruen Watchmakers' Guild of Cincinnati.

The proprietors of this watch factory have been very successful in their line of business, and their one idea in building this factory was to make it comfortable for the workmen, as they firmly believe that contented workmen are the finest tools of the factory.

This unusual factory is situated on a hill now known as "Time Hill," where it can be seen for miles around, especially from trains coming into the city. The unusual situation allows architectural and landscaping effects which cannot be had where the ground is level. This factory is the result of very careful planning on the part of the proprietors, the architects and builders.

The factory is devoted to the manufacture of high grade watches following Swiss models. To obtain advertising value from the building it was decided to carry out the architecture along Swiss chalet lines. The entire building and its surrounding grounds have been laid out to resemble the Alpine country.

Close View of Factory Annex

Stone Steps to Factory Built For Work and Romance, Too

The factory has a frontage of 150 feet and a depth of 200 feet, with an annex. Its entire construction throughout is fireproof. The walls are of brick, the first story being faced with dark red tapestry brick, ornamated with tiles. Above this the brick walls are stuccoed and half timbered effects introduced. The roof is entirely of green glaze tile.

High up above the roof are the antennae of the wireless station with which the building is equipped, so as to send out the correct time by wireless at certain stated hours. The large factory floors are provided with high windows which give abundance of light, as this is very necessary for watch making.

Entering the factory one is in the reception room, which is attractively fitted up, and passageways radiate from the central room to the various offices of the management. Beyond the office on the first floor, and the balance of the building is given over exclusively for factory space with the exception of a space on the second floor, which has a dining room and its necessary kitchen.

Only where absolutely necessary are dividing partitions used, the balance of the floor being one vast well lit room. The workmen are seated on benches built to follow the walls and face the giant windows. Sufficient space has been allowed in the equipment of the factory so that no workman is crowded, nor are any placed in dark corners.

The central picture presents a general view of the factory. Even on a cold bleak February day it looks attractive and an ideal place to work.

OFFICE and JOB MANAGEMENT

Things the other man has found out that save money

Short Cuts in Estimating

Simple Practical Forms that Save Time and Assure Accuracy

By I. P. HICKS

WE will now present a few practical forms for the use of the contracting carpenter. The prices are left blank so that the estimator can fill them in to suit the time and locality of the work. The system is the main thing, by carefully filling out the form you will have something very useful as well as reliable and it will prove to be a reliable guide in making estimates. It will save much time in figuring, it can always be kept up-to-date as regards prices, and it serves the useful purpose of being a good reminder of all the things to be figured on in making an estimate. It aids very much to shorten the work of estimating and tends to greater accuracy. Fill out the form, use it on your next job and you will be quite sure to like the plan.

ESTIMATING FRAMING BY THE SQUARE

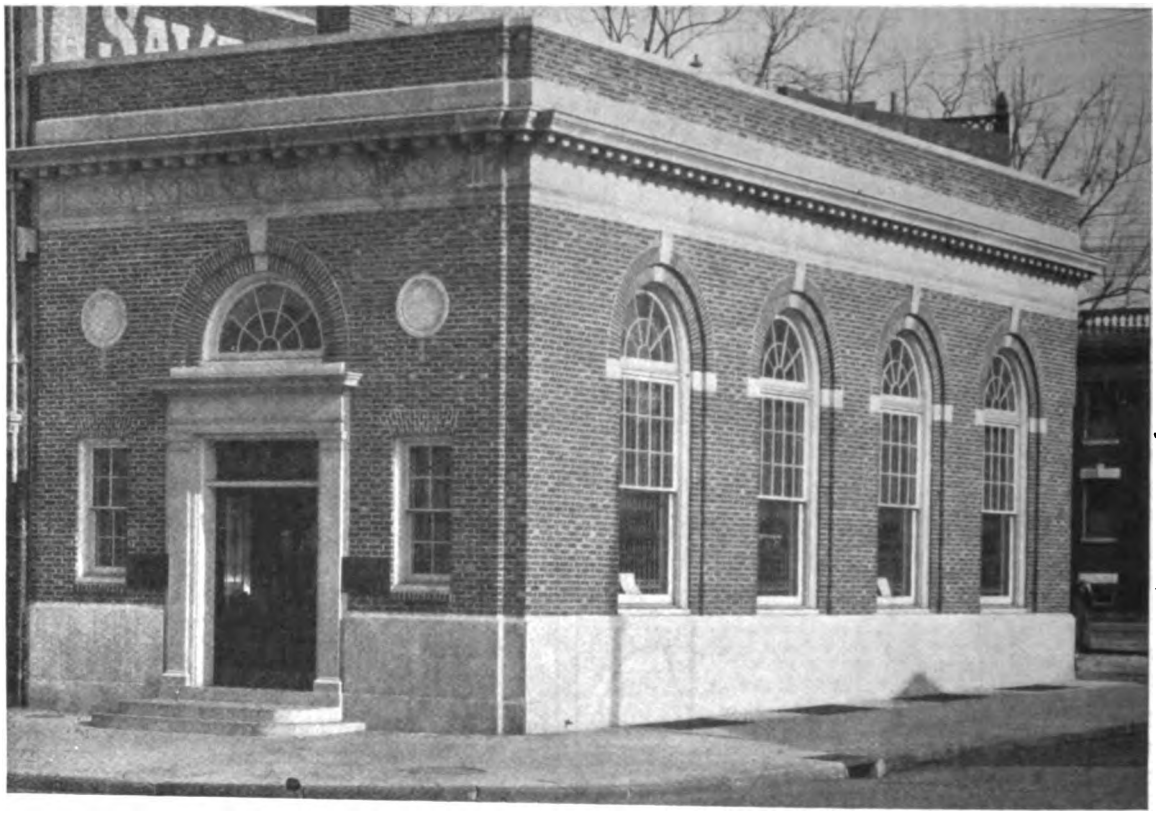
Cellar, per step and riser			
Clothes chute, per lin. ft.			
Linen closets, each			
Sideboards, each			
Seats, each			
Mantels, each			

THE contractor who will keep his records of estimates in the above form will find that he soon will have the right dope to enable him to estimate quickly and accurately by the square foot method.

To successfully estimate the labor necessary for the construction of a building, everyone must fix their own rates from actual experience in doing the kind of work which they may be called upon to do.

Tables, prices, and methods, are good in their way, and many times will give valuable aid in estimating, but experience and judgment are far better.

Make a Check List of Material



In estimating materials the most frequent mistake is the omission of some important item. A bill of material for the construction of a building always requires a long list of items, and it frequently happens that some are forgotten and left entirely out of consideration.

Probably more serious mistakes in estimating material arise from this cause than any other; they certainly are very discouraging to all contractors, especially so to the young man bidding on his first job. The thing he did not count on must nevertheless be bought.

Now, if the contractor had an itemized list of materials entering in the construction there is no doubt that by comparing his bill with the list, many mistakes from omitting items would be avoided.

In a bill there are many items of material that are used for different purposes and different parts of a building, hence to make a list complete in every detail it should mention the part of the building for which each kind of material is to be used.

Brick Bank Design

BUILDERS are often brought in consultation with the bankers who are contemplating the erection of a new home for their bank, and they should be able to suggest many items.

In erecting a bank building careful thought must be given to after requirements as well as present needs. There are many bank buildings today that were built only a few years ago that are modern in design and construction but are entirely too small for present day needs. They were incorrectly laid out and are entirely inadequate to handle the growing business of the institution.

Public space in a bank should not be too limited, there must be plenty of room for the customers, it is here that they congregate to do their business with the bank officials and crammed quarters are uncomfortable to say the least. A bank needs its customers the same as any other mercantile establishment and it is only by making it easy to do business that trade is kept.

Floor Plan

Arthur H. Brockie
Architect, Philadelphia

Horace A. Burrell,
Builder, Philadelphia

The design of the bank shown this month is that of the Logan Office of the Germantown Trust Company of Philadelphia. This building is a dignified looking structure situated on a corner, the size of same being 23x53 feet. One enters the bank through the vestibule and on each side of it is a convenient desk for customers' use, these form little nooks where a certain amount of privacy is obtained.

The architecture of the building is along Colonial lines, a base of limestone extends up to and forms the sill to the four large side windows, above that tapestry brick is used.

The basement contains toilet rooms, lockers and storage space, besides the heating plant and it's necessary coal storage. Ventilation is secured through several windows opening on to areas which are covered with iron gratings at the street level, these are clearly shown.

This design for a bank building has many points of interest and it will serve as a model for other good commercial structures.

PAINTING

Practical Points of Interest to the Builder

Preparing Buildings for the Painter

By A. ASHMUN KELLY

UNFORTUNATELY there is no law or trades rule to oblige the various workmen when constructing a building to have a thought for their comrades of other trades than their own, when at work on the same job. It is every trade for itself.

Where the sub-contractor takes a job at the lowest possible price basis it is manifestly not to his interest to have an eye to the interests of any other contractor on the same job. He must needs push his contract through as quickly as may be consistent with a certain quality of workmanship, this, of course, depending upon the price he is getting.

If, when the house painter takes a job in hand, he could find everything in perfect condition for beginning his work he would be fortunate, but as a matter of fact he never meets this condition excepting on the highest-class construction work, where the price allows for adequate time for attention to the little things which mean so much to the painter, such as smoothed woodwork, care in keeping plaster from it, protection of the floors, care in driving the nails, countersinking of nail heads, and perfect work in plastering, etc.

I believe that it is not common for a painting contractor to make allowance in his estimate for the condition of the job as it leaves the hands of the other workmen. It is true the contract is usually based on certain conditions that in a general way takes this matter in consideration, but it is not usual to find the work in an ideal shape for painting. It is not asking too much of the carpenter, the plasterer, and the others to exercise a little care in their operations, which would not be a matter of any considerable financial concern, and would, I am sure, be worth all its cost in mutual good feeling and a better grade of work.

Be Careful with Plaster

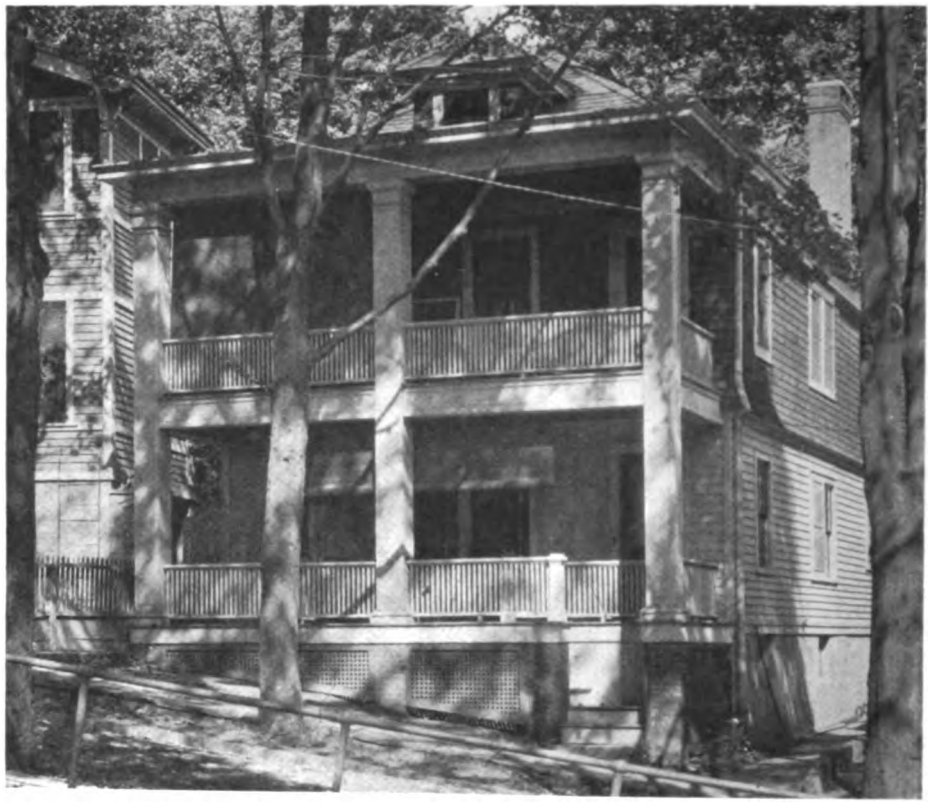
IT is well known that lime, as contained in mortar and plaster, darkens wood, some kinds of woods more than certain others, though any kind will suffer more or less. In fact, lime or other form of caustic is sometimes used to effect this very purpose.

Have the Best Side Out

CERTAINLY much will depend on the workmen, many of whom are careless and not first-class mechanics; it is easy enough to do good, clean work, if one is so minded. I have seen, for instance, a carpenter placing a board with its worst side out, when it could just as well have been placed the other way, and give a better side to the painter if a better was there. I know that some boards have no best side; then I suggest that it be laid aside and be used on a less important part of the job. Take a piece of stuff that has rough places caused by the planer running against a very cross grain—the painter finds a lot of work to do there with putty to make it smooth and level.

The house trim and general run of stuff used in building now is not of the uniform excellence it once was, therefore the carpenter should take a little care in its placing, putting the best of it in the most important places, or where it is to be seen most, and the other in less conspicuous places.

Some trim, for instance, will show stained parts; these are sources of much trouble to the painter, especially where the job is to be done in white or some very light color, for the stain is hard to conceal. Shellac must be used, and this sand papered smooth, and an extra coat or two of paint be given it to bring the part up to the rest of the surface. A little thing, yet of much concern to the painter.



Low Price Means Poor Work

WE can hardly expect a first-class job for the price of a second or third-class job. And nothing is meaner than a poor plastered wall. The painter sometimes paints upon the rough cast, the paperhanger sometimes, and very often, too, papers on such surface. If the job has been well done by the plasterer there will be no difficulty painting or papering such a surface. A poor whitecoat is another that the painter dreads. In fact, it is the worst thing he gets against in the painting business, I believe. There is no end of the trouble it causes him. It is full of lime, burns out the size and diverse problems which only a very expert is capable of handling.

Unfortunately for the painter, perhaps, he has no way open for retaliation, as his work comes last, after the other mechanics, excepting of course the pipe fitters, etc. Else he might give the recalcitrant man of the trowel and hawk some trouble, and likewise the carpenter, etc.

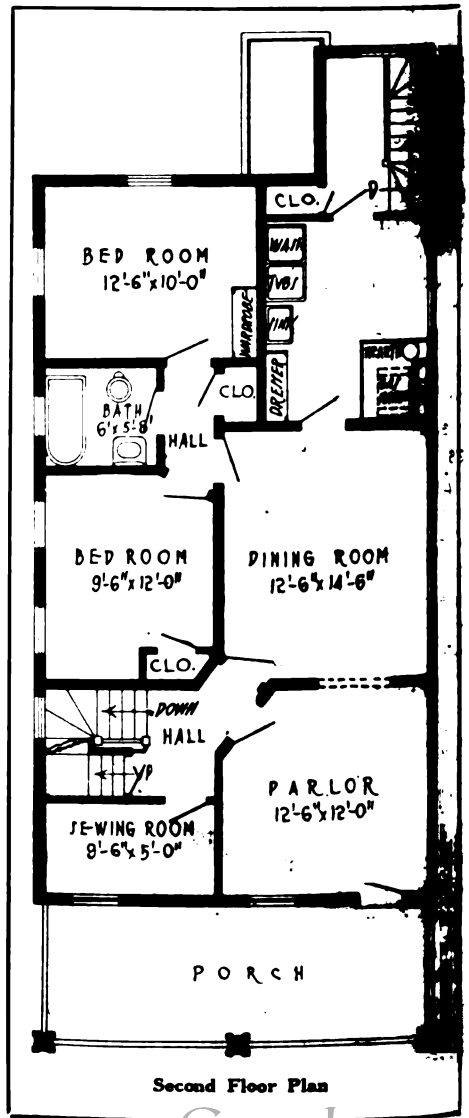
Two Family House

Plans Specially Designed for Readers of Building Age and The Builders' Journal

R. C. HUNTER
& BRO.
Architects
New York

Five Conveniently Arranged Rooms

First Floor Plan



THE two-family house appeals to quite a number of people because it is figured out that the rent of the one apartment will carry the charges on the other. In other words, when the house is paid for the owner can occupy one apartment without expense for repairs, taxes, insurance, etc.

The design presented herewith is so divided that it is actually two separate houses, one family cannot communicate with the other except by way of the outside. The front entrances are separate, there are separate service entrances on the rear and the cellar is divided so that each apartment has its own section reached by an independent stairs.

The rooms are very conveniently arranged. The first floor has a five-room apartment and the same layout appears upstairs with the addition of a small sewing room above the front hallway. Several rooms can be finished off in the attic.

It is interesting to note that this particular house was built at Middletown, N. Y., on a hilly street. This is a problem often met with by builders, and in this case it has been effectively handled.

Complete detailed working plans and specificaitons in blueprint form of this two-family Colonial house will be furnished by BUILDING AGE and THE BUILDERS' JOURNAL for a nominal sum

Second Floor Plan

CONCRETE

Form Work-Reinforcing Methods Monolithic and Block Construction

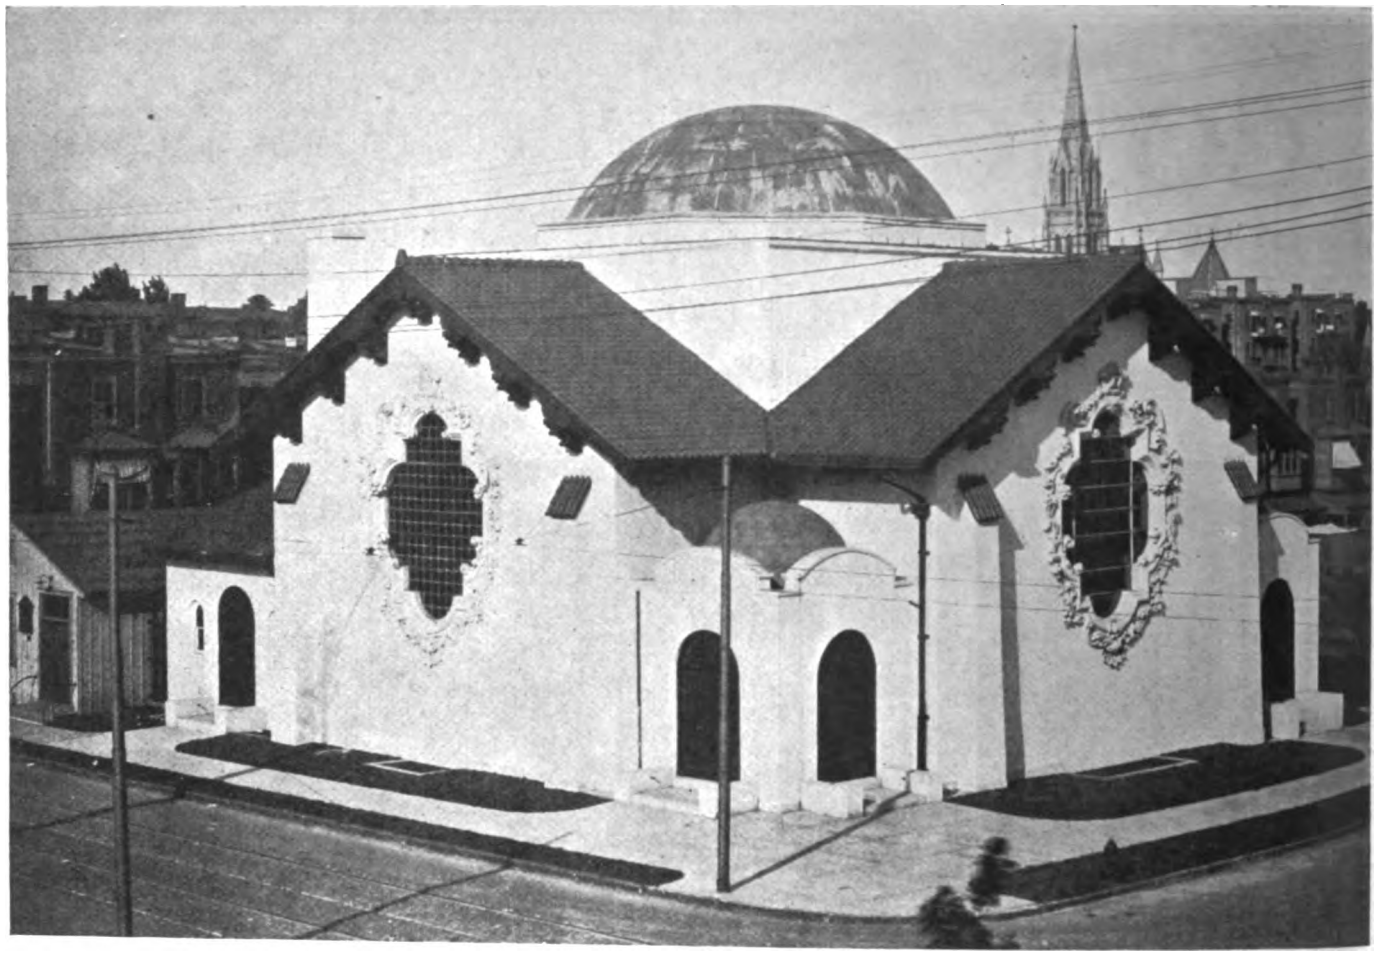
Success in Block Making

A Story of Making the Most of a Building Need

THE use of concrete blocks especially for foundation work, is on the increase. Quite a number of builders are making their own blocks in spare time, but the majority are buying blocks already made from some one who makes a specialty of this business.

Here is a story of how Fred Michelbach, of Bridgeton, N. J., has made a success in supplying local contractors with good blocks. Our picture shows how his plant is arranged, it is practically all out of doors, and operates continually except in cold weather.

Mr. Michelbach was a glass blower, who bought several acres of land some sixteen years ago and then discovered that it contained an excellent grade of sand; seven years ago he started to make blocks and has been at it ever since.



Besides plain blocks, Mr. Michelbach turns out some fancy block with facings of granite, marble, pebble finish, etc., also concrete ornamental columns, urns, flower vases, tomb stones, etc. Mr. Michelbach has two men working for him and they produce 800, 8x8x16 inch blocks in ten hours, they doing their own mixing, etc. His plant consists of two multiplex concrete block machines and a Blystone concrete mixer operated by a six horse power gasoline engine.

The finished blocks are put on flat cars running on a narrow gauge railway and put in a storage and curing shed; in this way the blocks receive the minimum amount of handling until they are fully hardened.

The blocks mostly called for are the smooth face kind which are made in the proportion of three parts sand and one part cement. The blocks are sold locally around Bridgeton, which is a city of about 15,000 population. The demand has been worked up by inserting small advertisements in the local daily paper. The selling price of the blocks is about 50% over the actual cost of manufacture, this price allowing a fair margin of profit besides covering interest on the investment and a certain sum for depreciation of plant, etc.

Of course, it is needless to say that Mr. Michelbach's success in this line is mainly due to the fact that he is turning out good blocks, but he also was a keen enough business man to grasp an opportunity when it came his way, and in this little story of his success many a young man in the building industry will learn the lesson that "Opportunity" is around us in the building line.

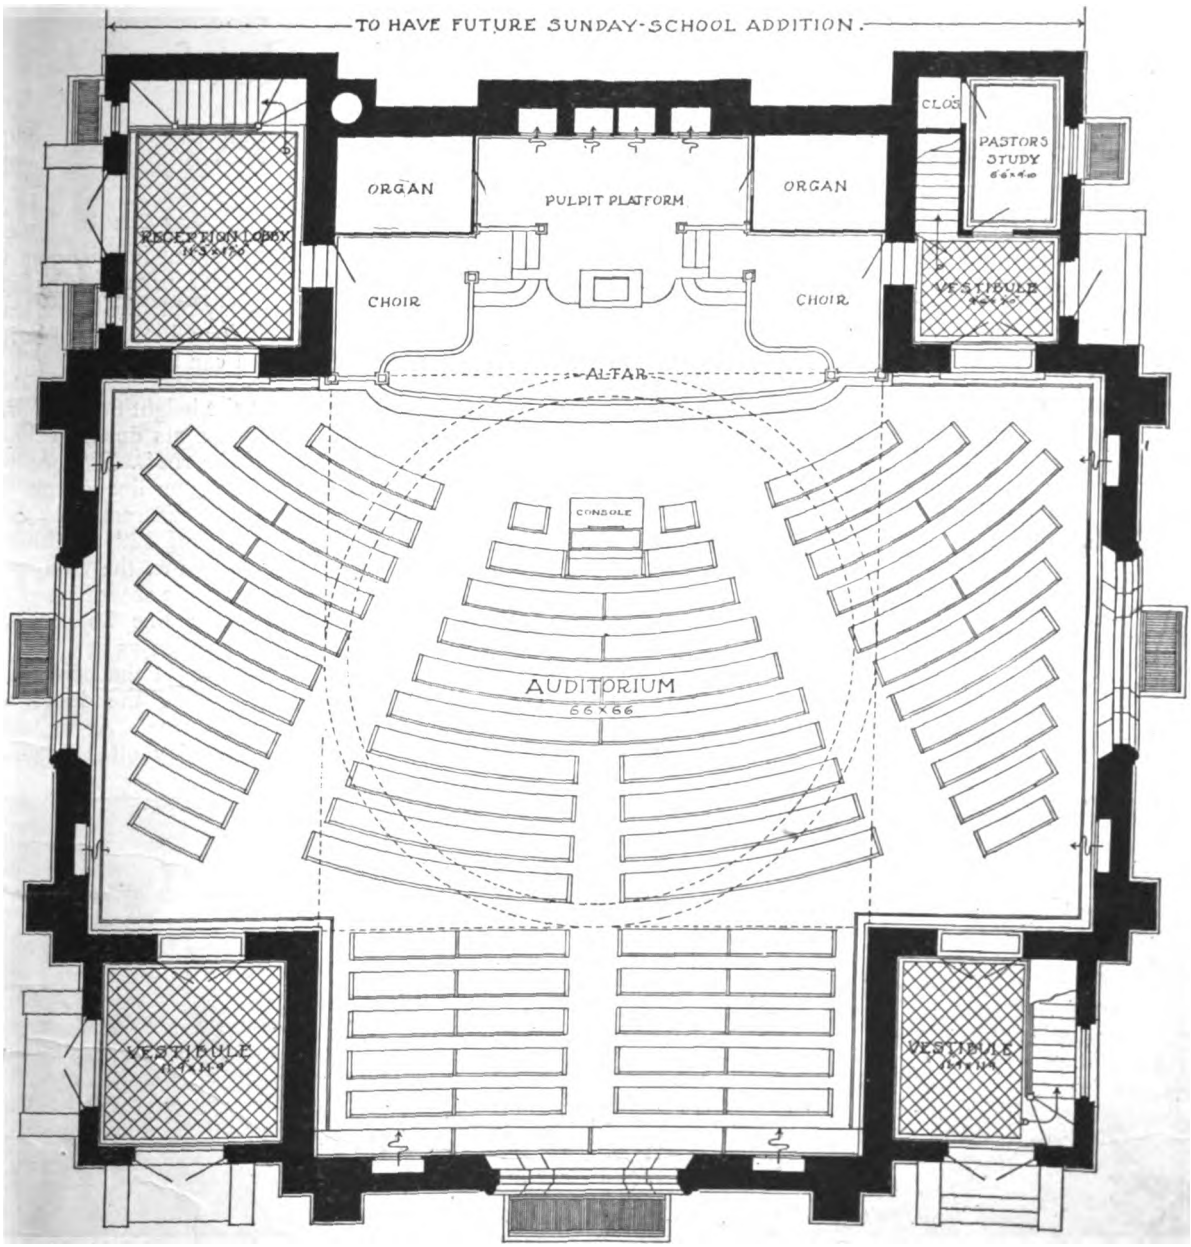
Unique Moorish Design for Church

CHURCHES like houses have more or less followed the same exterior design and interior arrangements that are to be found in other churches. We build more or less the way our ancestors did, of course each succeeding generation making a few minor improvements. But we somehow or the other do not break away from the old traditions.

In staid Philadelphia there is a novel design for a church which is rather out of the ordinary and we present a picture and plan of it as being of interest to our readers. One would expect to see a church of this kind in Southern Spain or Morocco, as the architecture is Moorish, and it certainly presents a most unusual appearance, especially amongst the common buildings to be found in our cities. Innovations of this sort are always helpful. They will go down as precedents and will be an incentive for others to strike out for something original.

The church shown here is that of St. Andrew's Methodist Episcopal Church situated at 45th and Walnut Streets, Philadelphia. It was built by Bard P. Evans & Co., Philadelphia, from plans prepared by Mr. C. E. Schermerhorn, 430 Walnut street, Philadelphia. The masonary walls are covered with white stucco which contrasts with the red tile roof and the timber brackets and rafters. The several hemisphereical domes form distinguishing features. The outside buttresses are covered with tile on the top which adds a little bit of color to the side walls.

The outstanding feature of these side walls are the large ornamental windows. The central window, that is the one at the front of the church, is of handsome stained glass of which we show an enlarged detail in the lower illustration. The elaborate carving around this window is worthy of special study, it forms a handsome frame for the window. Besides the architecture of the building, the treatment of these windows deserves special comment as being out of the ordinary.



The floor plans given on the opposite page show how the seats are arranged. Particular pains has been taken by the architect so that there is nothing to obstruct the view of the pulpit from any point.

Digitized by Google

The interior is fitted up in an appropriate manner, particular attention being given to the color of the walls, the furniture and lighting features. These are matters frequently treated as though they were of no consequence and many a good church auditorium has been spoiled in appearance by lack of attention to these details. As the plan shows, a domed ceiling is over the central part of the church and this is a striking feature of the interior.

A future improvement will be the building of a Sunday school room and social hall in the rear of the edifice. Our picture shows the temporary wood Sunday school which is now being used. This will be replaced with the new building, harmonizing in its architecture with that of the church. In some denominations considerable attention is given to activities which are outside of regular church work, but co-related with it. These are the social activities. Some churches in this case being more of a community center than just mere church. In some church buildings, libraries, bowling alleys, different club rooms, gymnasiums and even swimming pools, dispensaries, etc., are included in the church buildings.

Architects of our modern churches try to have the building express a place of worship and select a style of architecture that will carry out this idea.

St. Andrew's Methodist Episcopal Church, Philadelphia

Good Practice in Frame Construction and Finish

How to Frame a Conic Roof

By RICHARD M. VAN GAASBEEK
School of Science and Technology, Pratt Institute, Brooklyn, N. Y.

A CONIC roof is a roof having a shape like a cone; circular at the base and tapering to a point. It affords a study in laying out and fitting sweeps and methods for developing the exact shape and bevels for the covering boards either vertical or horizontal.

The following description is given of the conic roof problem developed in the Carpenter Shop of Pratt Institute, Brooklyn, N. Y., for the purposes of demonstrating to trade classes the principles involved in framing a cone shaped roof. It affords an opportunity for individual study that would not be possible if full sized timbers were used. In preparing a specification of suitable sizes of stock that were used in framing the problem, the writer urges the reader to lay out and construct the roof, for it is only by actually framing a roof that a clear understanding of the principles involved can be solved and mastered.

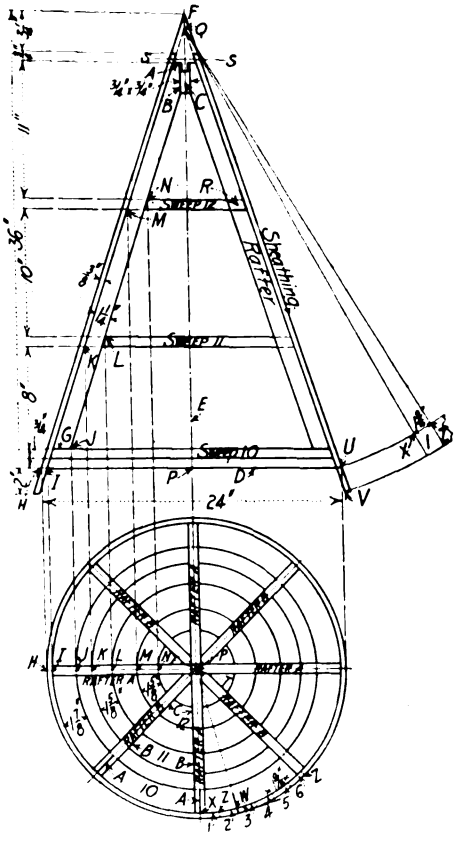

Fig. 1—Plan of Conic Roof, From Which the Working Lay-Out is Made

To make this model have the plate ¾" x 1¼" doubled, hip rafters ¾" x 1¼", circular ribs ¾" x 1¼", sheathing ⅜", and for dimensions see plan.

Lay-Out

Lay the plan out full size on a sheet of detail paper or a board, Fig. 1. From this lay-out, the exact lengths and bevels for all stock used in framing the roof can be taken.

Lay out the height first and project the various points down to the plan or base of the roof. Produce a base line D and a center line E from which to start the measurements. On the base line lay off 12" on either side of the center line, the total span to the outside of the sheathing. Lay off on the center line 36" measuring from the base line as at F. Connect the point F with the points on the base line, giving the desired outer shape of the cone. At right angles to these lines lay off ⅜", thickness

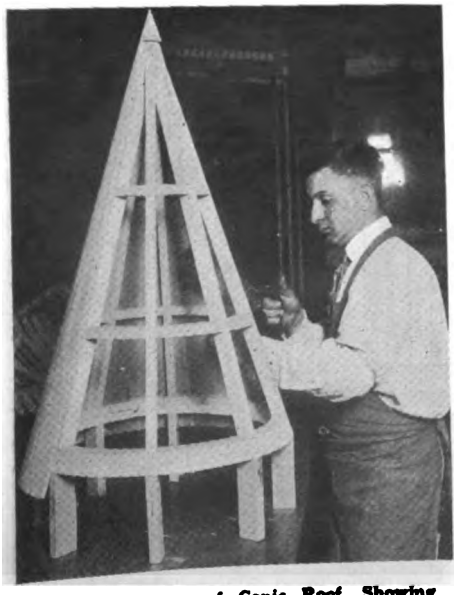

Fig. 5—Elevation of Conic Roof, Showing Method of Framing

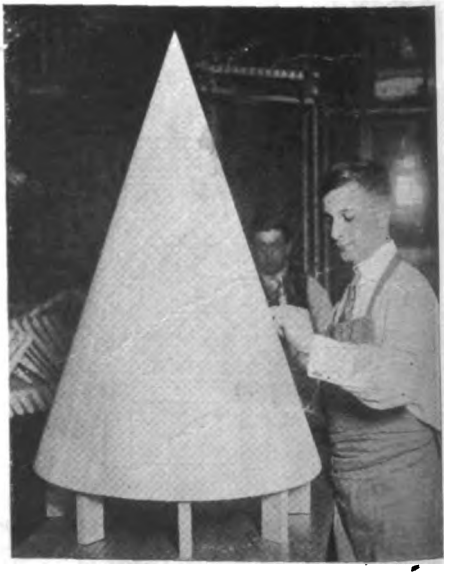

Fig. 6—Elevation of Conic Roof, Showing Method of Sheathing

Digitized by Google

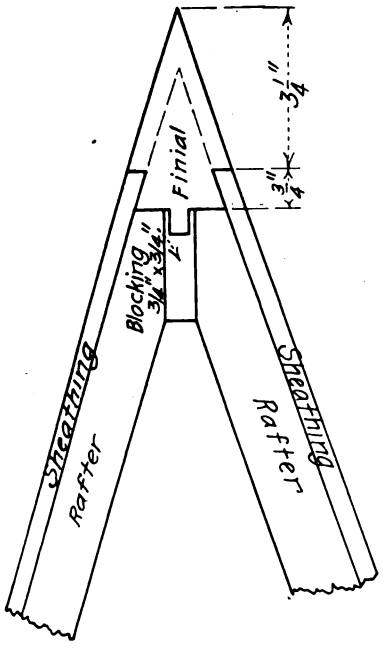

Fig. 2—Details of Finial—Section Through S-S, Figure 1

of sheathing, and 1¼", width of roof rafter, and produce lines parallel to the outside sheathing lines.

Measure up on the center line from the base line twice ¾", the thickness of the plate, doubled, and lay in lines parallel to the base line. Measure up on the center line from the plate level 8", the distance between plate and first rib, ¾", thickness of rib, 10", the distance between first rib and second rib, and ¾", thickness of rib. Through these points lay in lines parallel to the plate.

To eliminate bringing the sheathing boards to a feather edge at the extreme point the rafters are cut off 4" at the top and a finial, turned to continue the lines of the outside of the roof, is fastened in place to give a finish, see Fig. 2. If a ¾" x ¾" blocking is inserted as shown, it will make a strong binder in fastening the various rafters together.

The next step is to lay out the plan. First produce vertical and horizontal center lines and diagonal center lines crossing at an angle of 45 degrees. Project the various distances down from the section of the height to the plan as shown in Fig. 2.

Project the point H on the base line down to the center line on the plan giving to the outside of the sheathing. Project the point I also down to the base line giving the inside sheathing line. Set the trammel points to the radius P-H, which should equal 1' 0", or one-half the span, and with P as a center draw a circle. With P as a center and radius P-I draw another circle, giving the inside and outside lines of the sheathing on the plan. Draw in the full thickness of the rafters ¾", measuring one-half on either side of the center lines.

Project the point J down to the center line on the plan and with P as a center and a radius P-J draw a circle showing the inside plate line. Likewise project the points on the

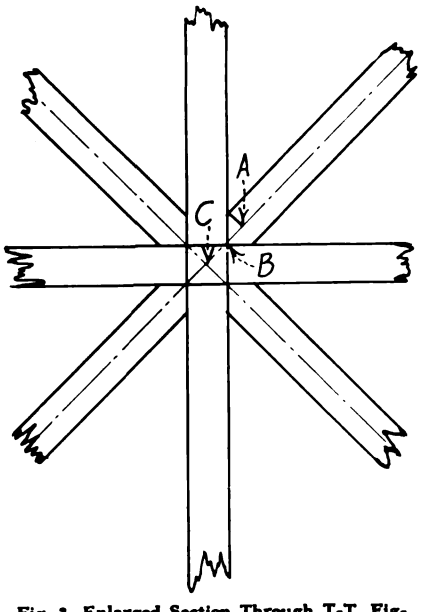

Fig. 3—Enlarged Section Through T-T, Figure 1, Showing Intersection of Rafters

ribs K-L-M and N down to the base line. With P as a center and radius P-K draw a circle, stopping against the side of each rafter. Likewise with P as a center and radius P-L, draw a circle, showing rib 11. With P as a center and radius P-M, draw a circle, with P as a center and radius P-N draw another circle, showing rib 12.

To Lay Out Patterns for Sweeps

It will be necessary to cut out horizontal ribs or sweeps to give nailing for the vertical sheathing boards. One pattern will do for each sweep. Sixteen pieces are required for the plate 10, and 8 for each rib number 11 and 12.

Lay the stock to be used for the pattern on the lay-out and with P as a center and the respective radius used in making the lay-out, mark out the sweeps.

The exact length of plate 10 is on the center line of the rafters, as at A-A. The exact length of sweep 11 is at B-B. The exact length of sweep 12 is at C-C, against the side of the rafters. Cut the patterns to the exact size and bevel for fit against the side of the rafters, but leave the stock to be used for the sweeps at least ⅛" to ¼" longer for fitting. In sawing out the sweeps number 11 and 12, tilt the band saw table to cut to the taper of the roof as at R.

The plate can be laid in position on the lay-out and fitted. In doubling the plate be sure and break the joints well and fasten securely, keeping the nails back from the sawing line. Without removing the plate from the lay-out set the trammels to the desired radius and with P as a center draw the circles, showing the outside and inside lines of the plate.

Remove the plate from the lay-out and cut on the band saw with the table tilted to the angle R. If required the inside of the plate can be cut out on a jig saw, or if care has been taken in framing the plate, the inside can remain square.

CONTRACTING EQUIPMENT

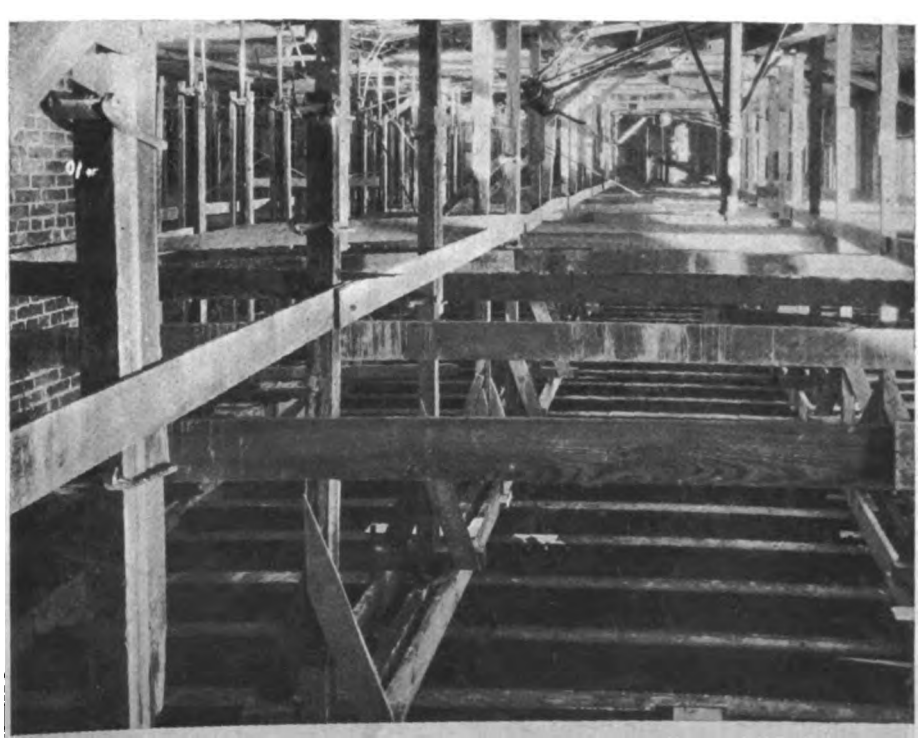
Reliable Information on Time and Labor Saving Devices

Removable Steel Forms

Concrete Beam and Floor Construction Simplified

By N. F. AMBRUSEN, C. E.

HERETOFORE wooden forms have been used almost entirely in the construction of concrete structures with an enormous waste of lumber and labor, which is well known by all interested in this class of work.



Our country's resources of lumber are rapidly diminishing, and the increasing difficulty of getting the lumber out of the forests increases the cost to such an extent that it will not be many years before it will be prohibitive for use in concrete work. Therefore, we must turn to other materials that will take its place so as to conserve our forests and use the lumber for purposes for which it was intended, such as houses, and the cheaper class of other buildings.

Steel forms have been used to a certain extent in building construction with a view of saving materials and labor, but so far it can only be considered as a substitution of materials. For a good many years the forming of the arches or slabs between steel joists has been done with permanent steel pans, which are left in place and become a part of the structure. This is a waste of steel as it performs no function as to the strength of the structure. It is merely a substitution of materials.

Removable steel forms have also been used, but with little or no saving in labor and materials as the lumber required for supporting these steel forms has not changed since the very beginning of the adoption of this particular type of floor construction. There are steel forms on the market today for other purposes, such as column moulds, which have been made standard and so considered by the designing engineers, with the result that in using these forms the cost of erection is much less than in using wooden forms. They can be used over and over, not only on one job, but on several.

There is no reason why this cannot be applied to the Beam and Floor Construction, and we believe the system of forms and shoring described in this article has accomplished this and proven it by a good many jobs already completed.

These forms are made in standard sizes and standard lengths, and supported by a standard made up shoring, and erected by a standard crew—and this standardization means *economy* and *low costs* in the *final results*. The most costly part of reinforced concrete construction is the form work and the primary object of this system is to make the forms into plant instead of the old lumber pile which goes to waste. Not only the steel forms, but the supporting wooden shoring, becomes part of the

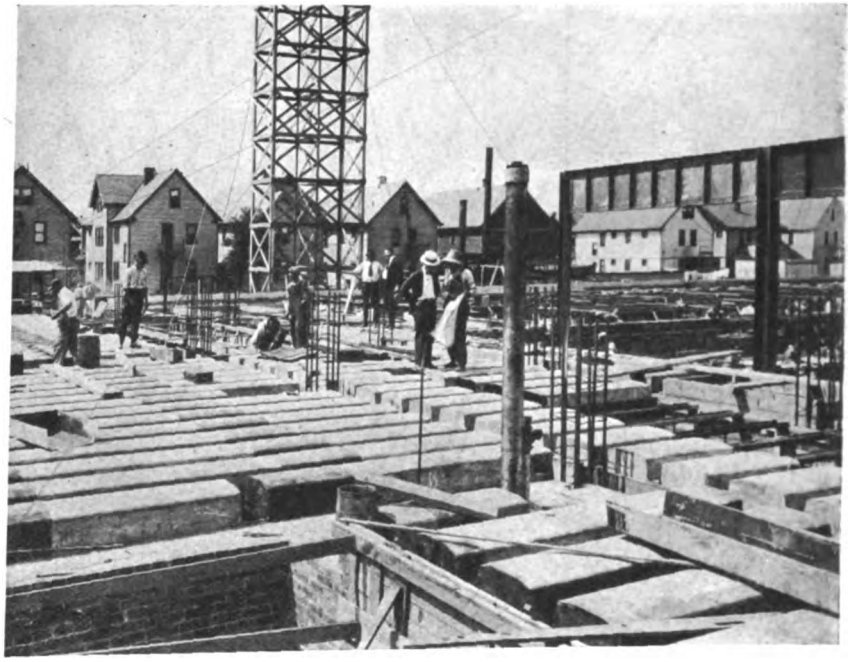
The Supporting Timbers for the Channels and Pans—Note the Clamps That Hold the Removable, Upright Supports

Digitized by Google

contractors' equipment fully as much as the concrete mixers, hoists, etc. These steel forms can be rented.

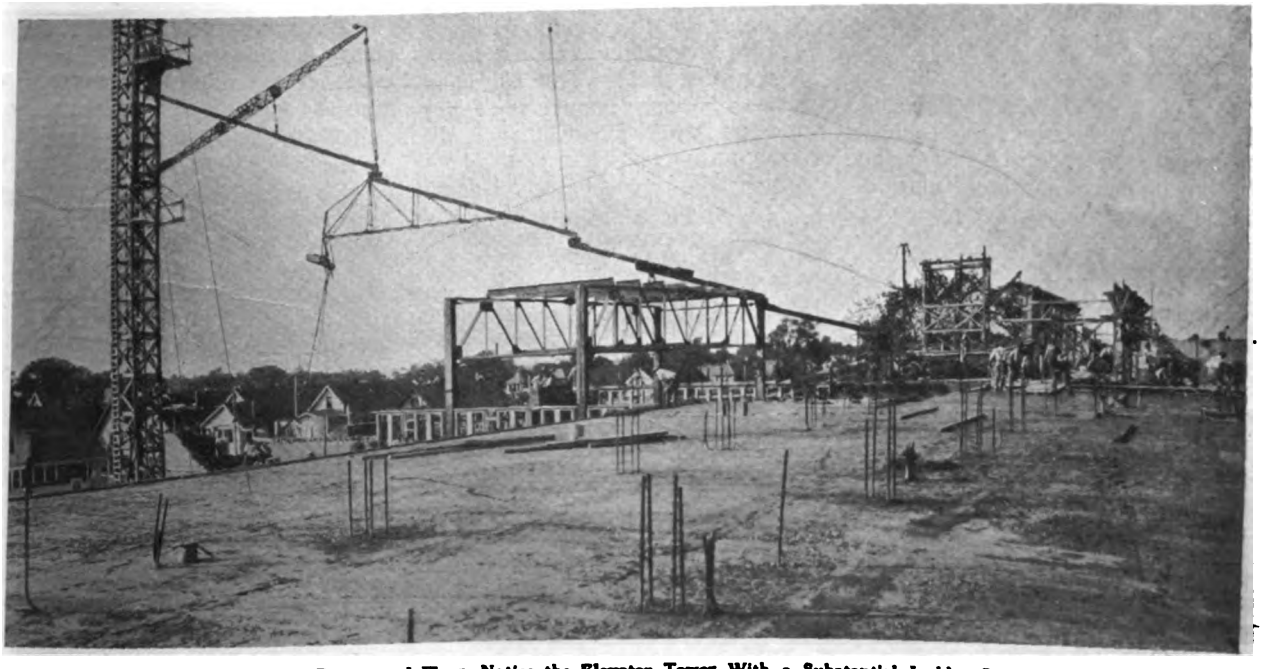
This cuts down the labor account and speeds up the work as the system only requires less than half the amount of materials; as it eliminates all reshoring, and 90% of the field fitting. As the system is standardized, it naturally follows that the costs become uniform, and therefore the only fluctuation, if any, is in the variation in the cost of labor in the field.

These forms consists of standard steel channels of certain lengths to be used for the soffits with an equal amount of steel pans with detachable headers and a corresponding amount of stretchers and cover plates. The channels are standard 6-in. channels, made in standard lengths of 6 and 8 feet, and these lengths combined with the stretchers would cover any fractional variation of spans. Holes for wires or bolts for hanging the ceiling are punched on the center line 12 in. apart.



The pans are die pressed from No. 14 gauge steel, 6, 8, 10 and 12 in. deep, and in standard lengths of 6 and 8 ft. to match the channels. These pans, in connection with covers, will meet any variation of spans. The headers are essentially a part of the pans and practically the same number is required.

The cover plates are also die pressed from No. 14 gauge and large enough to fit tight enough over the outside of the pans. The length is 30 in. and with a depth matching the pans.



The stretchers are die pressed from No. 14 gauge and the same length as the covers, and the two working together, form the sliding members which adapt the system to any variation of spans.

As you will note, the above material is made heavy enough to withstand the ordinary rough handling in the field, and, naturally, will last indefinitely. In connection with these forms, a spreader is used in locking the forms together and, at the same time spacing the reinforcing bars in the proper position, and this spreader also acts as a chair for the bars. These spreaders are applied and are buried in the concrete when poured; they are really the key and are made of one piece and placed in the forms

FINANCE and REAL ESTATE

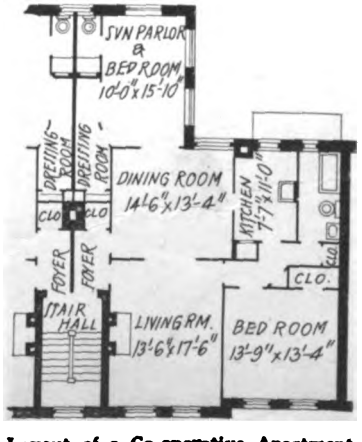
Helpful Data for the Builder Who Builds to Sell

Single House or Co-operative Apartment?

Interesting Deductions of a Prospective Home Builder on the Kind of a Home He Can Afford to Own

By JAMES T. BEARD, JR.

CHANCING to read an advertisement in a recent New York Sunday newspaper, its heading, "Eliminate the Landlord's Profit," appealed to me. The ad sung the praises of a large co-operative apartment development in the vicinity of Manhattan, just twenty-two minutes from Forty-second Street. It sounded well to me then, but I have learned a lot of interesting things since. I guess one always learns some new things in a process so intricate as house-hunting.



Today the words of that ad recall to my mind a little personal incident that happened when I was a traveling machinery erector. In the performance of my duty I ruined a new shirt, so I charged it on my expense account, but payment was refused, so I quietly "padded" my next expense account to cover the item.

And so with the landlord's profit. The greedy, gouging landlord. "Eliminate the landlord," said the ad, "by buying one of our beautiful apartments on the co-operative plan. Become a Tenant-Owner."

So I went around to see these apartments. I timed myself on the subway and they were just twenty-two minutes from Forty-second Street. I saw the rooms with the light and air streaming in every window, the playgrounds for the kiddies, the tennis courts, etc. I was pleased and inquired about prices, payments and other details.

Here is what I found. The rent-raising, profit-making landlord was very much like my shirt. You couldn't see him, but he sure was there. He was disguised in many forms, such as charges for coal, water, janitor service, taxes, interest, repairs, amortization, management and fixed charges. Management and fixed charges are very broad terms and cover a lot of ground. At any rate, the elusive profit of my old friend, the terrible landlord, was successfully disguised as one thing and another. I couldn't put my finger on it, but I could feel it.

I wanted a five-room apartment. For this I was to subscribe for $6,500 worth of stock in the Co-operative Association. I must pay $2,000 down on my share in this equity, leaving an unpaid balance of $4,500. I would then be entitled to a lease on this five-room apartment, provided my name sounded good to the members of the Association and they were assured that I was not a disreputable and undesirable character!

Layout of a Co-operative Apartment Selling for $6,500

My contract required a monthly payment of $134. Of this amount $61 a month would go for my share of the operating expenses of the apartment house and the rest ($73 a month) would pay off my indebtedness and interest in six years and four months.

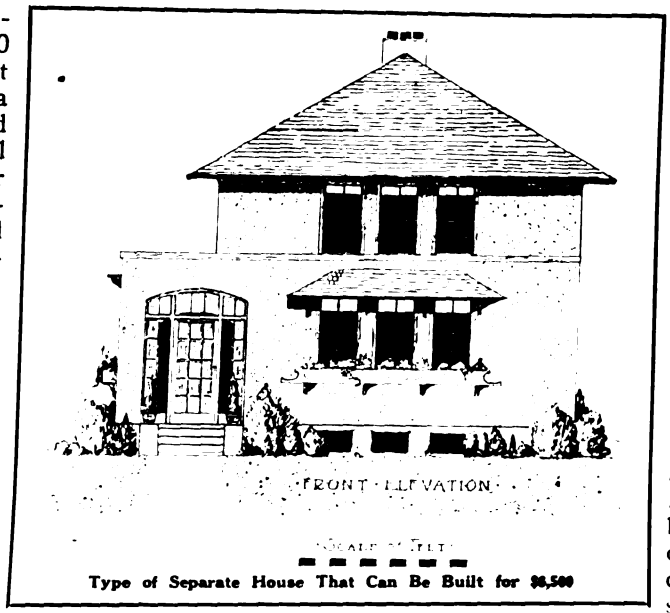
Certainly no one should object to paying $134 a month for five rooms. Five similar rooms rented for $50 a month in 1910 with a month's rent free. Surely they should be worth at least $134 today!

But this particular unit of the big house-hunting public didn't want to pay $27 per room until he saw what he was getting. I asked some more questions. In six years and four months my stock would be paid for. Then I would own my apartment; the five rooms would be mine. Would there be any other payments, I asked? Oh, yes, a small item of $61 a month would still be charged to cover the management and operation of the building. As a matter of fact, after my stock had been paid for I would have to make monthly payments of $99 for the rooms, but I would receive a dividend every six months equivalent to $38 a month. This would make the actual cost only $61 a month.

I found out another interesting thing. After I had paid for my stock I did not own my apartment. My five rooms were not mine. Although I had paid $2,000 down and $134 a

Digitized by Google

month for 6 1/3 years ($12,-184 in all) for a $6,500 apartment, that apartment was not mine. There was a string tied to it. If I wanted to sell they would let me sell my stock, but the purchaser could not live in the apartment without the approval of and lease from the Co-operative Association. If I wanted to remodel my apartment I had to get consent.



Five rooms, unfurnished, for $61 a month. Sounds like an old-time To-Let ad. doesn't it? Those were the good old days. At that, it was a pretty gouging, greedy landlord that charged $61 a month for five rooms in those days. It was more like $50 a month, with the proverbial month's rent free.

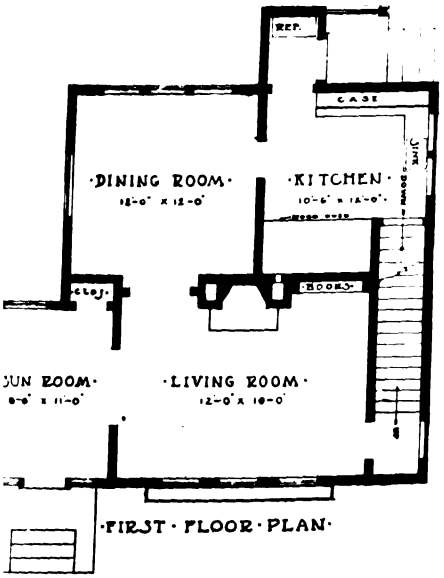
Who knows but in ten years, after I would have become a full-fledged Tenant-Owner of my Landlordless Apartment, some of the old-time landlords would again be charging $50 a month, while I would still be chucking in my little sixty-one dollar ante every month. I am merely speculating. I say, "Who knows?"

But what bothers me is why does a man who has paid over twelve thousand dollars for a sixty-five hundred dollar apartment have to pay more rent for the apartment that he owns than the poor sucker will pay six years from now to some profit-grasping landlord for the apartment that he doesn't own. And what difference does it make if I give $5,500 profit to said gain-greedy landlord, or donate it to a Co-operative Association. A rose by another name smells just as sweet.

I admit, I am a trifle dull. I cannot always fathom the depths of this real estate finance. But, today, I am paying only $55 a month for five rooms, with alcove, attic and basement to boot. Of course, I am only a Tenant—not a Tenant-Owner.

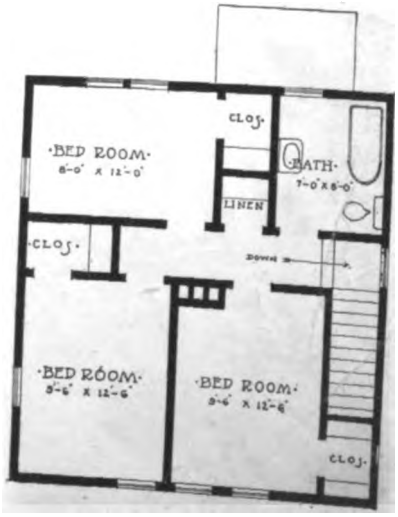
But, being a simple minded and rather obstinate individual I still wanted a house and I still had a hunch that a house could be had on terms that an average man could pay. I had an architect prepare a plan for a seven-room house and submitted it to a builder for an estimate. He said he would build it for $6,500, which was just what my stock in the five-room apartment would have cost. I could pay $2,000 down and arrange with a Building and Loan Association for the balance. The building loan people looked over my plans and would give me $4,-500. My payments would be $45 a month for a period of 11 years. The operating cost of my house (taxes, insurance, coal, etc.) would be $42.50 a month.

Type of Separate House That Can Be Built for $6,500



In other words, I could live in a brand new seven-room stucco home, with my own yard, my own cellar—my own house, to do with as I liked—for $87.50 a month for the first eleven years. After that it would cost me only $42.50 a month to run it. Now, I can afford $87.50 a month, but I can't afford $134 a month. Even if I could afford it, I would be seven kinds of a boob to pay $134 for five rooms, when I can get seven rooms for $87.50.

But the real milk in the cocoanut (or, shall I say, the big fly in the ointment) comes after the final payment has been made. For, it would cost me $61 a month to run the five-room apartment, while I could run the seven-room house for $42.50. And, best of all, I would be a full-fledged, honest-to-gosh Owner.



COMPARATIVE FIGURES

	Co-operative Apartment	Separate House

WHAT'S NEW

New Materials and Equipment that Keep Your Work Up to Date

Sash Balance Improvement

SPRING sash balances have gained favor every year. Each detail of their construction has been perfected, and today many users find them the most acceptable method of window balancing.

A new invention just developed by the Pullman Mfg. Co., Rochester, N. Y., is their patent tape hook device, which enables the balance to be installed or removed without removing the sash from the frame. In new work you may fit and fasten the sash into frame, put the stops all in place and leave the installation of the balance until the last, if so desired. Likewise to remove the balances is an easy matter and is done without disfiguring or marring the woodwork. There is quite a difference between this method and the old weight and cord where if a cord should break the average home owner had to call in an expert carpenter to handle the situation.

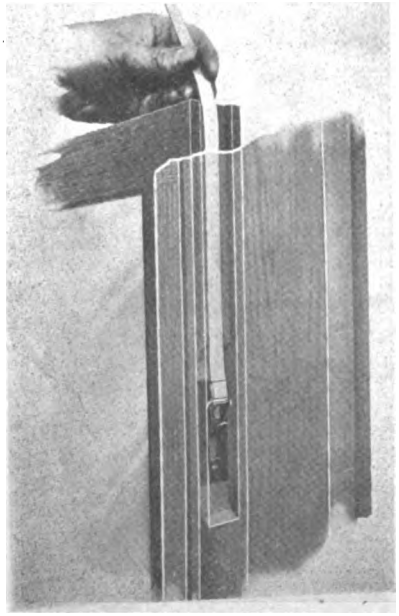

Fig. 3—Inserting

The importance and possibilities of this new Pullman Sash Balance invention cannot be overestimated when you take into account the labor involved for the removal and replacement, also the refinishing of the sash and frame. In installing the sash balance the tension must be taken off the spring while attaching the tape to the sash. The well known method is to pull tape out as far as possible and insert an ordinary wire nail into the slot in the drum, as shown in Fig. 1. A special wedge is now made to take the place of the nail. To release the nail or wedge just pull the tape a trifle, when the nail or wedge will drop out of the slot.

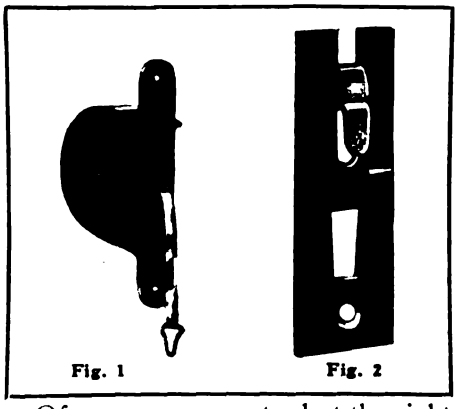

Fig. 1 Fig. 2

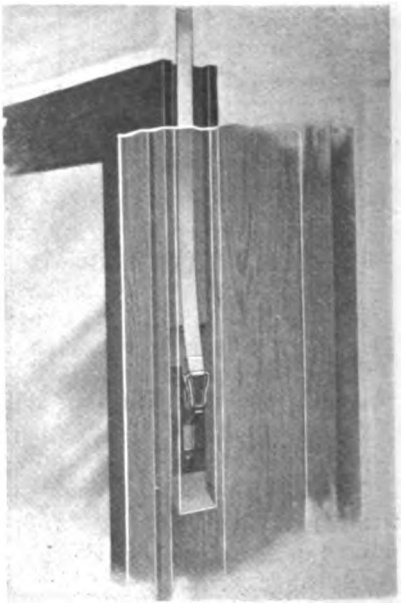
Of course, one must select the right balance for the weight of the sash. Another point to look out for is to keep the tape absolutely free from paint, otherwise it will gum up the drum and seriously interfere with the action. One could hardly expect the balance to do proper work unless this precaution is taken.

The new device consists of the special type loop which is shown in Fig. 2. This is to be fastened to the sash in a special short groove as shown in Fig. 4. This groove is made by means of a 3½ inch cutter in less time then one can make the groove for cords.



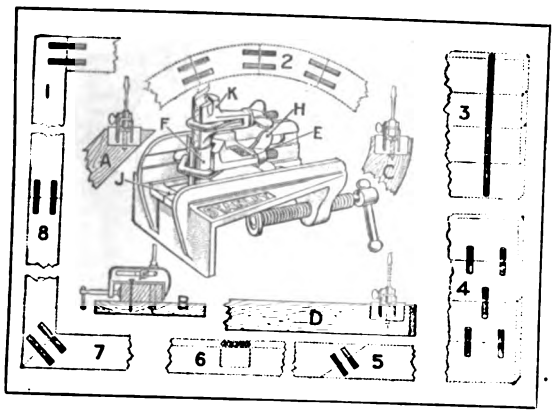


Fig. 4—Removing

To install withdraw sufficient length of the tape from the balance and insert wedge or nail so as to hold it securely. Now insert tape with the loop on the end into the groove in edge of sash, and when it strikes the angle piece push lightly so that small end of loop will be depressed and larger end raised, then slightly pull the tape very tight, holding loop in place while the wedge is removed and the tension will then hold the hook in place.

To remove the tape pull it out and wedge it the same as for installing. Then pull tape upward firmly against the hook so as to take up the slack and push it downward a little until the end of the loop is clear of the hook, when it will spring away from the hook, enabling the tape to be withdrawn. The size of the hook plate is ¾ inches wide and 2⅞ inches long, and it should be set in the groove so as to be about 10 inches from the top of the sash.

Doweling Jig

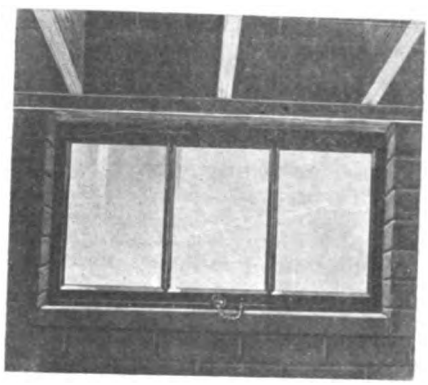
THE tool shown herewith enables the user to bore dowel holes in the edge, end or surface of work with ease and accuracy. It is made by the Stanley Rule & Level Plant, New Britain, Conn. It can be used on material up to three inches. It also forms an excellent bit guide for mortising.

When making dowel holes with only a brace and bit it is also necessary to use a square to insure the hole being bored perpendicular to the edge of the stock, and even then more than ordinary skill is required to produce perfect work.

With the Doweling Jig the steel guide is automatically set to guide the bit properly when the Jig is clamped to the work.

If drill bits are used there will be no danger of boring out of line, even in cross-grain wood or through knots, and the use of drill bits is recommended for quick and accurate work. However, excellent work can be done with the ordinary worm bits if care is taken to see that they fit closely in the guides. To allow for variations in size of bits the guides are made 1/100 inch larger than the sizes given.

In the illustration, which shows the tool complete, "E" is the slide carrying the steel guide "F," by means of which the bit can be brought to the required distance from the edge of the work.



The guide "F" is held in slide "E" by the screw clamp and thumb nut "H."

Having decided upon the distance the dowel hole is to be from the surface of the work, place the bit guide in the slide, bringing the two marks on lower edge of guide the same distance from the end of the Jig as the center of the dowel hole is to be from the surface of the work. The under side of the Jig is graduated for this.

Then place the Jig on the work, bringing the mark "J," on the front of the tool, so that it is in line with the mark on the edge of the stock.

A depth gauge "K" is also furnished which can be used with or without the Jig. Where used without the Jig, the gauge should be set with the gauge end towards the point of the bit, but in using the same with the Jig it should be set with the small end down, as shown.

Figs. 1 to 7 show various forms of work where the Jig can be used to good advantage; thus 1 shows a butted corner; 2 shows circular segments; 3 single matching; 4 staggered matching; 5 spliced joint; 6 mortising; 7 mitred corner; 8 butt joint.

Steel Cellar Windows

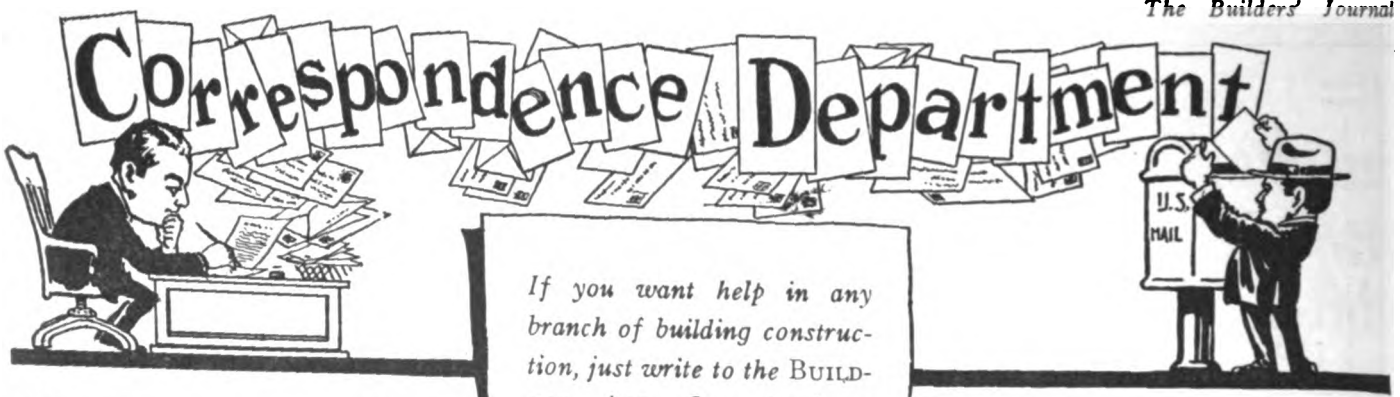
CONTRACTORS and builders in general will be interested in a new basement window in steel now being marketed for use in residences, stores and apartments by the Detroit Steel Products Co. of Detroit, Mich.

A number of advantages are claimed for the new window, which is designed to take the place of wood windows, and which is being sold through dealers at prices which bring the cost to the building owner as low or lower than wood.

The chief argument advanced in favor of the steel window is that it admits 40 per cent. to 50 per cent. more light for the same sized masonry opening. This extra illumination is secured through the use of narrow solid rolled steel bars in both frame and sash, thus eliminating the wide wooden members and permitting the use of large glass lights.

Another advantage, which will be appreciated, is the fact that the steel window cannot warp nor stick. The difficulty experienced by the average home owner in trying to open and close his wood windows, when the sash have swollen and warped, is entirely eliminated as the steel members are unaffected by moisture.

The outside bars of the window are not intended to imbed in the building construction in the way usually employed where steel sash is used. The building construction is intended to come up flush and tight against the window on both sides, and at top and bottom, anchorage being secured by means of four straight, flat pieces of steel about 1" wide to 4" long. These are laid in the mortar joints in such a way that the ends extend about ½" into the channel frames at the jambs of the window. Two clips are used on each side, and these are sufficient to anchor the window solidly.



Portable Hoist

THE raising of construction material on the site can be more economically done even on a small job by using a small, easily moved gasoline driven hoist. The picture below shows such a hoist and it will give a good idea of its size. It shows the No. 7 reversible hoist made by the C. H. & E. Mfg. Co. of Milwaukee, Wis.

The advantages of such a hoist will be obvious to every contractor. The expense of moving a heavy boiler and steam engine hoist has prevented their use on many smaller jobs, but this type of a little gasoline engine driven hoist solves some of the problems. It does not need a licensed engineer.

Sharpening Plane Bits Accurately

IT takes an experienced hand to correctly sharpen a plane bit. The average bit, when touched up on the stone is more or less convex on the bevel, and the work which results is not as accurate nor clean as when this bevel is exactly straight.

After ascertaining the correct angle which the edge of the bit makes with the straight stock, cut a block of wood from a piece of two by four inch material about four inches long on the base. Drill a small hole into the beveled side of this about half way from each side and vertical with this surface and procure a two inch screw with a washer just small enough to slip through the large end of the slot in the bit.

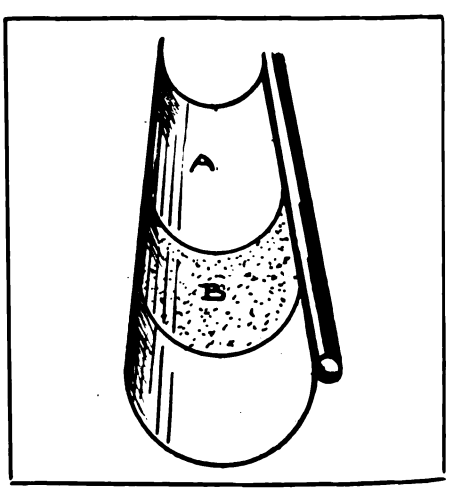
The base of the block is gouged out with a wood chisel leaving a slight elevation at each end which rest upon the surface of the whetstone when in use. The bit is slipped into place, and the screw tightened to hold the bit firmly and the edge brought to the proper shape by light, circular motions.

I have found that this stunt was well worth while for the occasional user of planes, since a keen cutting edge can be put on the bit in short order.—**Dale Van Horn.**

Short Cuts in Putting on Trim

I HAVE a little kink for putting on casing that I use on all work possible and no doubt many carpenters may also use it, but the large majority I come in contact with do not.

I use a crotched gage cut out about ⅞ and about 8 inches deep which I carry with my kit in putting on casing with my cap finish. I nail on the head casing first, then fit the side casing to the floor. Slip this gage over the side casing under head and mark on face above gage which gives the perfect fit, and saves fitting head to casing. This is especially valuable where material has been filled or stained. Now in putting down base I use another short kink with this gage and pencil dividers where base runs from corner to door casing. First lay base down in place, then set dividers to required width and scribe corner, next move over to door casing, and slip on gage against casing and scribe the same amount alongside gage. Use a good, hard pencil, quite sharp. A 5 or 6 H is best. I use this always with perfect fits, as it makes a clear, sharp line.



Previous to using this method, I, as every other carpenter I have ever seen, would fit the corner, then put down again to mark for casing end.

I also might offer another kink on trimming which I consider a great time saver. I start at a convenient place and number, on the wall or grounds, the base spaces from 1 up. After numbering all I go around with a board and mark down the measurements of each space and place opposite to each corresponding number, allowing one or two inches over for fitting.

After taking a record of all the lengths I take my saw and cut up the base material into lengths best suited to the material on hand, and mark out each length to be cut and place the corresponding number on back of base, which can then be taken to the work bench for cleaning or dressing if required. I find this much better than letting carpenters take long lengths to rooms to be cut, as it saves the waste of having short pieces left over.—**Andrew E. Smith.**

Repairing Damaged Eave Troughs

I AM certain this sketch is worth publishing in your very practical magazine, as it will be of much interest to many of your readers. It is the method I used to mend eave troughs that are not too badly rusted to be beyond repair. I first clean the old trough thoroughly and then apply a thick coat of mastic roof paint (or asphalt paint as it is called), to the entire interior of the trough and on this paint I lay a good quality of prepared roofing or canvas and then thoroughly paint same, including the edges of the lining to prevent the wind from getting between the lining and the metal eave trough. I repaired several troughs in this manner two years ago and they are in good condition at the present time. In the sketch A is the lining of roofing or canvas, B the mastic paint and C the eave trough to be repaired.—**D. W. Daly.**

A Sleeping-Porch for Every Bedroom

TO include a sleeping-porch for every bedroom should be one of the most important features of home planning. Considering the hygienic necessity of sleeping with the windows open and then realizing that the single bedroom has not been improved upon since man slept in a cave, as far as dressing in warmth is concerned, is it not natural to reason that

Digitized by Google

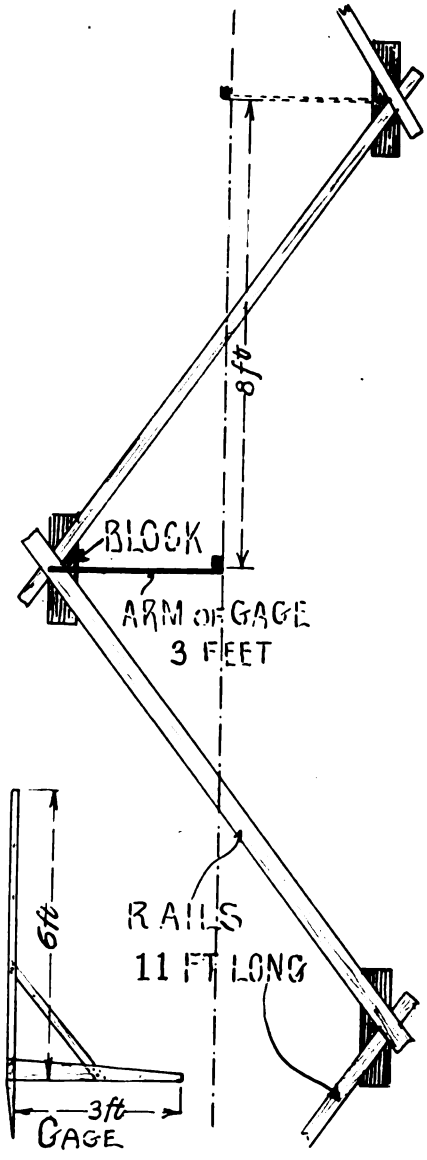
bedrooms should be planned with a little more commonsense, and foresight for comforts that could easily be enjoyed?

In place of the usual single room there should be two rooms—one just large enough for the bed, with sufficient space to get around it, and the other of a size meeting needs for a dressing room. Bedrooms can be arranged in this manner if the house is planned with this end in view, judicious planning though being essential to get a harmonious arrangement; such details as placing the sleeping rooms to avoid one adjoining the other, insuring access of sunlight, and placing rooms to utilize space to the best advantage, must all be considered.

A style of window hardware is available that permits of the real thing in a window opening for a sleeping-porch room; it is for casement style sash, being so hinged and operating on a track set in the sill and by rollers and a groove in the top jamb, as to permit of folding the windows to each side, thus procuring the large, airy opening which offers that intimate touch with the outdoors that a sleeping-porch should convey. In inclement weather these windows may be closed to any degree desired.

A glass door should be hung between the two rooms. This provides more light for the dressing room—may perhaps supply the only ingress of sunshine—and conveys a sense of coziness at the same time that it serves a purpose; it also links up the two rooms quite intimately.

The outstanding feature of this arrangement is that one may sleep in a room to which plenty of fresh air is accessible and also enjoy the comfort of dressing in a room that has not been exposed to the outdoors temperature all night long; during the day the glass door may be kept open and the sleeping room windows closed, thus permitting the sleeping room to be thoroughly warmed and comfortable at the hour of retiring.—**Hans K. Hoerlin.**



Building a Worm Fence

I SEE by the December issue of BUILDING AGE a subscriber asks for a sketch of a "worm fence" or rail fence as it is usually called here. I hope this will solve his problem.

I have helped my father build them when a boy and will try to give directions and a sketch of same.

First cut rails 11 feet long and if timber is over 6 inches diameter split in halves, quarters or more, according to size of timber, so that the rails will be as near one size as possible. Also cut blocks 2 feet long and about double the size of rails to place under corners, these are required every 8 feet of actual length of fence.

Set stakes about 5 or 6 feet high down the center of proposed fence line about every 15 or 20 rods. Make a gage as follows, take a stake about 6 feet long, sharpen one end so it can be set in the ground easily. From a board cut a cross

arm 3 feet long 3 inches wide at one end and 1 inch at other. Nail this to stake about 16 inches from bottom at wide end, also a small brace. Set this gage at starting point directly in line of stakes in fence row, turn cross arm at right angles to fence, place on block under the end of arm, set gage ahead 8 feet and turn arm in opposite direction and place block and so on down the line. Start rails first one on two blocks diagonal of fence line and second one ending on top of first rail and other on block and so on; then second layer in the same manner until desired height is reached. Sometimes stakes are driven on either side at cross section and wired at top to prevent winds blowing over or stock pushing down.—**Andrew E. Smith.**

HAVE you ever used any machinery or device which has saved you time and money?

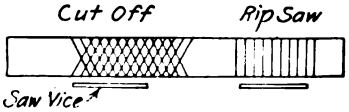
Have you ever invented any way of doing a piece of work quicker?

If you have BUILDING AGE wants your experience, and will pay regular space rate for it.

Your description should tell just how you saved time and money, either by a special way of using machinery or by short cuts in construction. Point out what methods you were using before adopting your "Time Saver" and show how your new method turns the trick. You can submit as many articles as you want.

Address The Editor, BUILDING AGE, 920 Broadway, New York City.

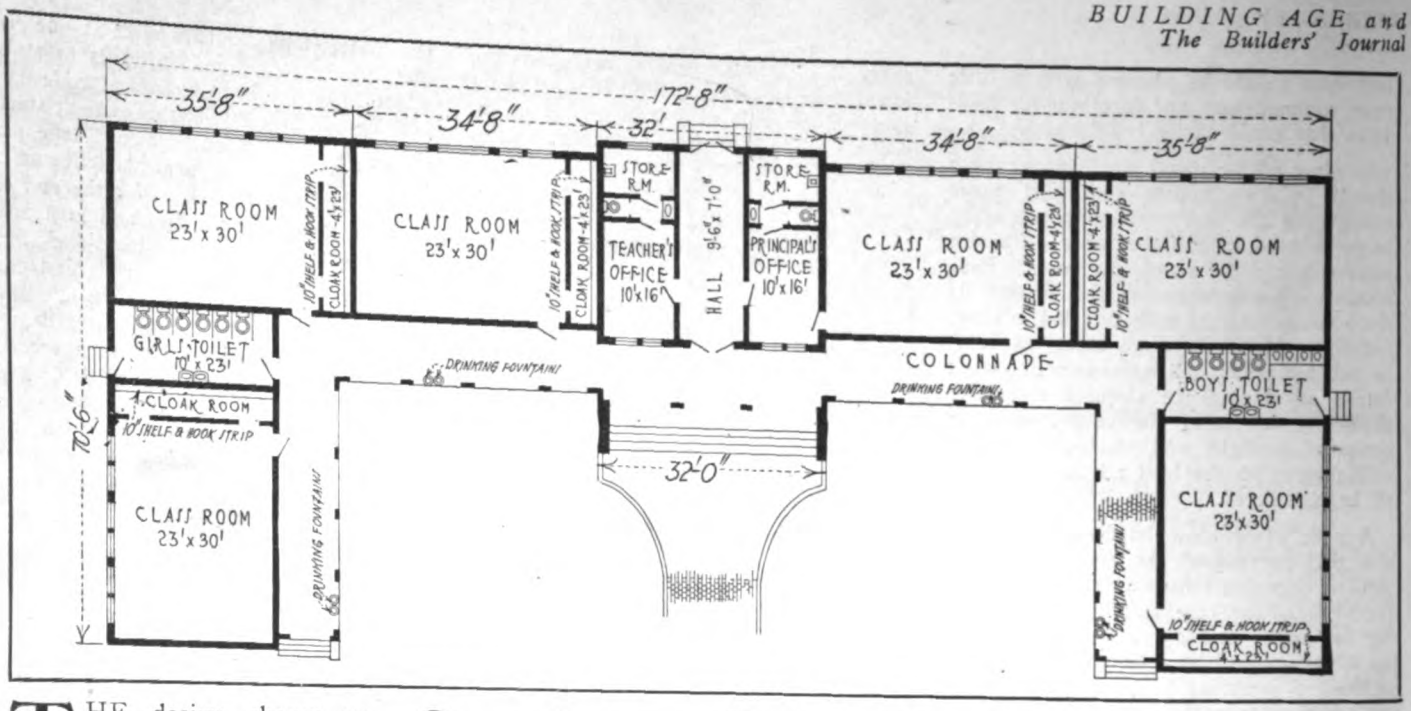
Staining Shingles



THERE is economy in staining roof shingles. This is a fact that is not to be doubted, though the practice has still to find wide favor. Wood shingles offer one of the best and most attractive roofing materials known. But with the many manufactured preparations now on the market one is often induced to select something else in place of wood shingles for the ultimate saving alone. Wood shingles are not permanent. But when properly treated with stains or paint, they become much more so than when left in their natural state, and besides that the appearance is considerably enhanced.

It is the general rule to use but one color with wood shingles. For the roof of the house a dark stain such as green or red is quite appropriate. Shingles in green, white, gray and red may be obtained, but the staining can be done equally as well on the job just before they are applied. It is a mistake to stain shingles after they have been laid.

When the stain is applied on the roof, the wood under the row next above is not impregnated with the water proof material, and it is just this portion of the shingle which needs it the most.—**Old Timer.**



Saw Filing Kink

HERE is a saw filing kink that I think is original with me. Take a smooth board 6 inches wide by 30 inches long and on one end draw lines at right angles and ⅛ inch apart as a guide for rip saws, on the other end at whatever angle you want the bevel on tooth (like cut).

To use place board behind saw vise almost level with the same and parallel with saw. Make all file strokes parallel with the guide lines. With this I can make a needle run full length on most any old saw and that is some test for good filing.—**George E. Cole.**

Southern School of Hollow Tile

THE design shown on this page is an interesting example of a modern southern school. The arrangement of the different class rooms is shown in the plan above. This school has just been completed at Arco, a suburb of Brunswick, Ga. The contractor and builder on the job was Mr. E. Merritt, of Brunswick, Ga., and Greenville, Ala., who also prepared the plans and specifications.

The architecture of the building follows Spanish lines. The walls are built of 8 inch hollow tile covered with stucco, the finish coat composed of white Atlas cement and white sand. The roof is covered with imperial red Spanish tile.

The large circular space over the main entrance is to have a clock which was not installed at the time these two pictures were taken for us.

Provision has been made in the design so that additional class rooms can be annexed. The new class rooms would be built in front of each wing, the colonnade being extended in the same style as shown.

The floors throughout are of cinder concrete, laid directly on the ground, there being no cellar. In the class rooms yellow pine floors have been laid on sleepers imbedded in the concrete. The corridor, colonnade and walks are paved with 6 inch square terra cotta tile laid over the concrete. The steps are all built of brick. As can be imagined but little heat is required and this is supplied by two No. 5 Arcola Hot Water Systems.

All class rooms are of the same size and are so arranged that the pupils will have the light from the left. Blackboards of slate are provided in each room, also large wardrobes. There is no interior hall, access from one room to the other being through the colonnade.

Modern Private Garages

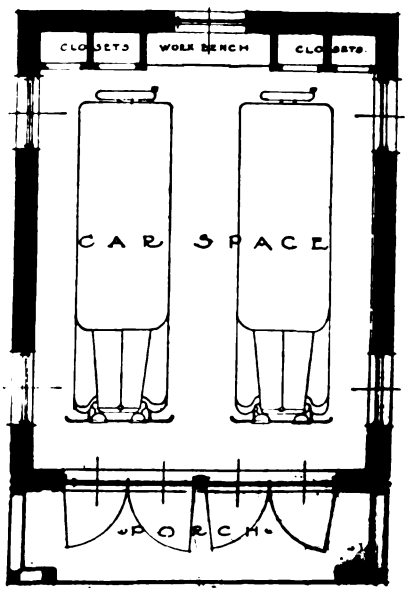
Two Designs with Pergola Porch Fronts

PRIVATE garages are necessary adjuncts to the modern suburban residence. The design should conform in external appearance with that of the house so that it will form a pleasing part of the back-yard vista.

Garages are common enough, but the two designs we show on this page differ in having a front porch as it were, both of pergola type. These designs will look very picturesque when vines are grown across the pergola tops.

The garage shown above is of comparatively cheap construction, the exterior walls being of drop siding with corner boards and the roof of asphalt shingles. This is a single car garage, size being 16x20 feet outside dimensions.

The garage shown below is an artistic example of brick work suitable for two cars. It was built for Mrs. Jules Wellens, at Germantown, Pa., after plans prepared by Heacock and Hokanson, architects of Philadelphia.



It is interesting to note that part of this garage is undergorund, as it is set in the slope of a hill, it is an artistic and practical design exceptionally well carried out.

It is a curious fact that the great majority of people want a cheap garage, and this is the reason why there are so many of the portable tin cans ornamenting backyards. It costs but a little more to have a good-looking design that will be in harmony with the house, and builders should try to impress upon their customers the desirability of having something good to look at rather than an eye sore. What could be more interesting to look at than one of these flower covered garages that help make the back yard picturesque.

Years ago when the surbanite had a $50 cow he would not object to paying a few thousand dollars for a barn to house the said cow, but nowadays the same party or his descendants do not hesitate to spend a few thousand dollars for a car and then want to keep it in a $100 shed. Times have changed.

Of course, it means a little more profit for the builder to erect a desirable garage, but good looking structures will add to the value of the owner's property as well as to the whole community.

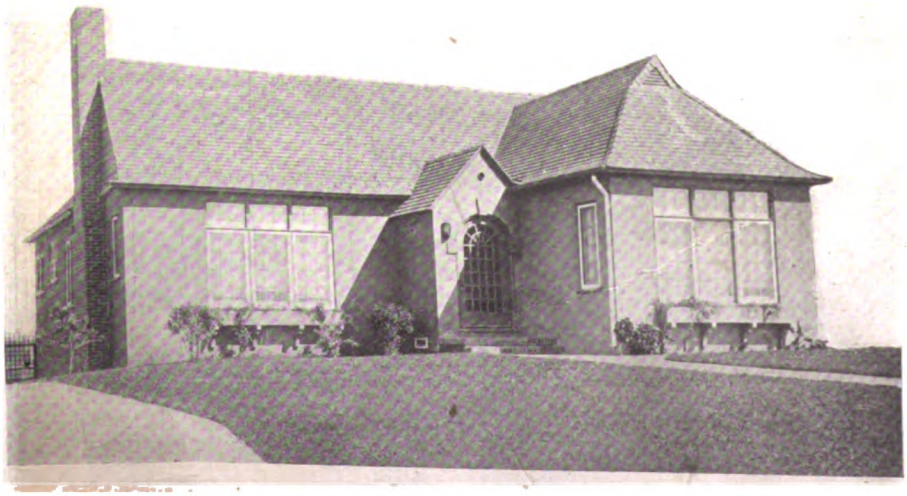
Well Planned Bungalow With Rear Patio

Designed By WALTER S. DAVIS



ILLUSTRATED herewith is an especially well-planned and attractive new-style California bungalow designed with a delightful little rear *patio*. This *patio*, enclosed on three sides by the house walls and open to the back garden, is directly accessible from the dining room, through French doors, and from the rear bed room. The front entrance is by way of a small vestibule, with an outer door of glass set in an arched doorway, which opens into the large living room, and window boxes beneath the two groups of front windows constitute enhancing details.

The outside walls of the house are of coffee-brown cement-stucco over frame construction, and the roof is of wood shingles painted black. The trimming consists of light brown for the window frames, the front door and the flower boxes and white for the window sash. The entrance steps and stoop are of brick, and brick is also used for the construction of the outside chimney.

An open doorway, colonnaded and buttressed, connects the living room and dining room, and a short hall, accessible from the former, brings the two front bed rooms into communication with the bath room, while a pass-closet intervenes between the middle and rear bed rooms. The back sleeping room, incidentally, is provided with an individual toilet, and each of the bed rooms possesses a good wardrobe closet. The built-in features include, as reference to the accompanying floor plan discloses, book-cases at each side of the livingroom fireplace, a linen closet in the hall, a drawer cabinet in the toilet of the back bed room, a medicine case in the bath room, a draught cooler-closet and a great deal of cupboard room, besides the other usual conveniences, in the kitchen, and a disappearing or cabinet ironing-board and a closet for brooms on the rear porch.

The interior finish consists of pine in old ivory, with a small amount of mahogany trim, in the living room and dining room, of pine in old ivory alone in the breakfast room, three bed rooms and hall, and of pine enameled white in the bath room and kitchen. The walls in the breakfast room are finished with a paneled wainscot and plate rail, with the space above papered, and paper is also used for covering the walls of the living room, dining room and bed rooms, while in the bath room and kitchen they are finished to a height of four feet six inches with a smooth, hard plaster coat which is enameled like the woodwork. Oak floors prevail throughout, except in the bath room, kitchen and rear porch, the bath having tile flooring and the kitchen and porch pine. The fireplace in the living room has a wood mantel, interestingly designed, and a tile hearth.

The unusual features of this house design are the two triple windows; one in the living room and the other in the front chamber. These two windows extend to the ceiling in both rooms and above the double hung sash are transoms. This arrangement of these two feature windows presents the opportunity for some very artistic decorative treatment on the interior; the large glass area gives the feeling of being a part of the great outdoors.

The bungalow has neither a finished basement nor cellar, but the slope to the ground naturally leaves a roomy storage space under the rear which at any time can be easily converted into a basement, with outside entry. The equipment includes built-in gas radiators and all other modern conveniences. The house is located in Los Angeles, California, and was designed by Walter S. Davis, of that city.

How to Frame a Conic Roof

(*Continued from page 47*)

Place the stock to be used for the rafters on the lay-out and transfer the lines. The bottom is a plain bevel cut against the plate as at G. The top is cut at A against the finial and at B against the blocking. Cut four rafters A to this size and fasten in position with blocking for a binder. The blocking gives better nailing and facilitates handling and holding the rafters in position when assembling. Four rafters B fit into the intersection of rafters A, as shown in Fig. 3 (an enlarged section through H-T, Fig. 1).

To Lay Out Rafters

Lay the stock to be used for the rafter on the lay-out as for rafters A. The bottom is the same bevel cut against the plate as at G. Mark the top for the extreme length on the center line as at C, producing the plumb line on the side of the rafters as at C, Fig. 4.

To determine the cutting length, measure the distance C-B, Fig. 3, and transfer this distance to the side of the rafter, measuring back on a level line from the extreme length as at C and produce plumb line B, Fig. 4, squaring across the top edge and locate the center.

To make a fit into the corner against the sides of rafters A, measure back on level line from plumb line B, a distance equal to one-half the thickness of the stock used for the rafter. Produce plumb line A. Square across the top edge of the rafter and connect the points as shown on the top view, Fig. 4.

To Assemble the Rafters

Assemble the rafters as shown in Fig. 5. Set up the rafters A first, securely nailing them and then rafters B, fastening them well at the plate and against the four main rafters. Mark the stations on the rafters locating the positions of the sweeps, taken from the lay-out. Fit the sweeps in between the rafters and the roof is ready for the sheathing.

Determining Shape of Sheathing

To find the exact shape and bevels for the outside covering or sheathing boards, divide a section of the plan between center lines on the inside line of the sheathing into a number of equal parts, as 1, 2, 3, 4, 5 and 6. These distances should be equal to the desired width of the stock to be used for the sheathing.

The sheathing should be as wide as possible, according to the sweep of the plate. If the sweep is flat, the sheathing can be wider than for a quick sweep, otherwise it may be necessary to hollow out the back of each piece in order to have it ride properly on the frame work, and considerable dressing may be avoided in finishing the outside surface of the sheathing if narrow stock is used.

The length of the sheathing is determined by developing the curve of the roof on the rafter line or back edge of the sheathing. Project the top edge of the rafter up until it intersects the center line as at Q. With Q as a center and radius Q-U draw part of a circle. With Q as a center and radius Q-V draw another part of a circle, giving additional length for the projection.

On the first curved line lay off two points X-Z, a distance apart equal to two divisions marked off on the plan showing the width of each piece of covering as No. 1, X-Z. Connect these two points with Q and continue the lines down to the bottom of the projection, as shown in the section of the height, Fig. 1. This gives the exact shape and size of sheathing to cover the roof, make a pattern and lay out 48 pieces required.

The measurements have all been taken on the rafter line or inside edge of the sheathing which gives the minimum size to cut the covering which insures a tight joint on the inside. This will leave the outside joint open a little, which is all right.

If the joint is to be a tight fit, the edges must be beveled, making the outside of the sheathing wider than the inside, due to the fact that the further away from the center the greater the circumference. To determine this bevel, connect one of the divisions on the plan with the center, as shown in Fig. 1, division 3. Draw a straight line from the edge connecting the two joints on the face of the sheathing. Set the bevel square to bevel W, Fig. 1. Bevel the edges of the sheathing to fit, making the sheathing the amount of the bevel wider then the pattern, used in laying out the stock. Sheath or cover in the roof, as shown in Fig. 6.

Removable Steel Forms

(*Continued from page 49*)

with one movement. They replace numerous items of material and labor required by other systems, and therefore constitute a great labor-saving device.

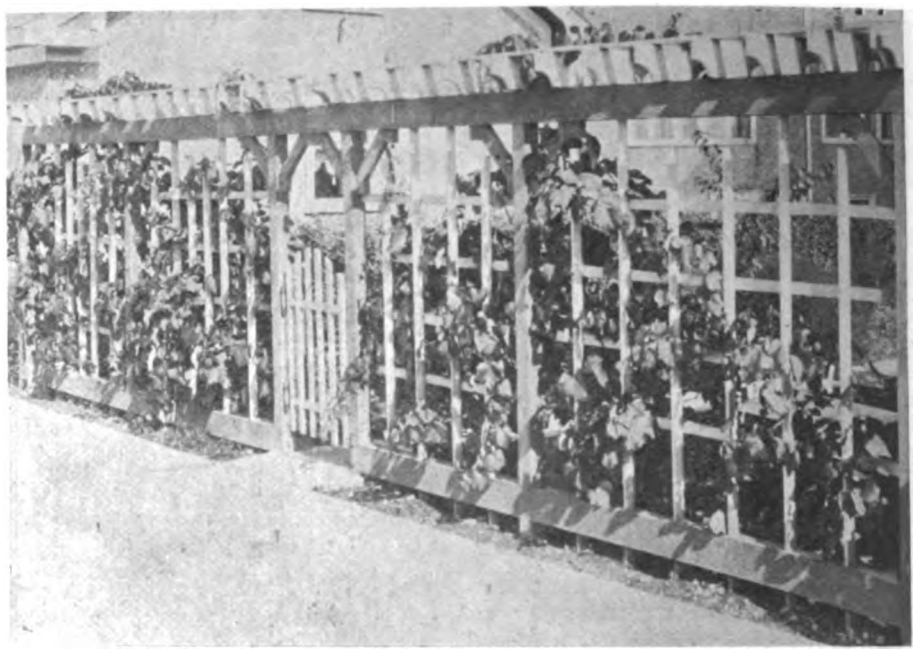
All the lumber necessary for the erection of the steel forms consists of shores or posts and stringers, which also become plant and, being of standard sizes, 90% of these can be salvaged and used on various jobs until the life of the lumber is destroyed. This lumber can be shipped from place to place, which has been done on several large jobs.

The shores are 4 x 4 scantling with a 4 x 4 cross piece braced at the top. The outside stringers are 2 x 8s of stock lengths and never cut as they are allowed to lay—which is an important point. The middle stringer is a 3 x 8 and supports the floor after the outside stringers have been removed.

In other systems most of the lumber somewhere in the method must butt up end to end. That is, it must be cut to exact lengths. Every time you cut you pay wages and waste lumber. If it is to be used on another job it is certain it will not fit as it will probably be too short and is generally considered of no value for another job. Therefore the lumber is material and not plant. The only waste being the small amount of bracing which is common in every system, but even this is reduced considerably.

The photographs herewith show the assembling of the form with the shoring ready to receive the forms. The forms were stripped from three to four days after pouring.

The above building is the Patrick Henry School at Cleveland, O., and the forms were furnished and erected by the Building Products Company of Toledo, Ohio. They also furnished the reinforcing steel and lathing. The Drummond Miller Co. were the builders.



These forms are now being used on several buildings throughout the country with the best of success, and this is merely a beginning of using removable steel forms in the building construction.

Back Yard Fences

THE building of a fence to enclose the backyard is generally left entirely to the building contractor. Too often but little thought is put on this design, either it is a plain board fence or pickets.

Now, the back fence can be made attractive as well as other parts of the house. In the majority of cases the housewife looks out of the back windows more often than the front, therefore, why should she not have something pleasant to view?

The several illustrations in this article will serve as suggestions of what can be accomplished at a low price. There is nothing hard or elaborate about any of these designs and still they are all pleasing.

Try to give your customers something along this line, get them to speak about your artistic work. While a fence of this sort will cost a little more money, the home owner will not object to it, so long as it will give him something better than he expected.

Suggestions for Profitable Work in Spare Time

Digitized by Google

What the Editor Thinks

Safety in Construction

EVERY now and then we hear of some accident where workmen or passers-by are killed or badly injured by having building material fall on them while it is being hoisted. Too much care cannot be taken for safety in this matter, especially in cities where all of the operation is done on the sidewalks with the public passing by.

A good rule to follow where the building is more than three stories high is that no material for such construction should be hoisted or lifted outside of such building. It may seem a little more work to do the hoisting inside, but it is more safe and will prevent accidents and lawsuits.

Quite a number of the accidents occur due to the breaking of the ropes which are used in the hoisting. The greatest danger seems to exist in the use of slings. Rope slings are easily cut by the sharp corners of building material; they simply wear away and unless examined carefully they will be used on some lot of material which will drop when the rope parts.

Material is often pulled along the ground before it is hoisted vertically. This saves a lot of time, but care should be taken that there is no obstruction in the way for the load to catch on. It is hardly expected that a rope can pull over the side of a building, but that seems to be the object of some laborers who are supposed to be directing the passage of the load. A terrific strain is put on the rope and it is not surprising that afterwards it will part even with a lighter load.

The hoisting of material needs intelligent direction, the same as the construction end of the building business. One thing that should be entirely eliminated is the habit of workmen riding up with a load. If the hoisting of steel beams, etc., on a skeleton building was generally done from the inside, there would not be the same incentive for workmen to take a thrilling ride. We all like a gallery to see us do a stunt and without an audience there is no fun in doing it.

Success in the Building Business

THERE are four basic essentials which every builder should strive to study and excel in, so as to make a success as a building contractor. These are the handling of equipment, the handling of materials, the handling of men, and the handling of accounts. All of these subjects form a big study and experience in each department will be the best teacher.

Equipment should be taken care of, it will last longer and give better results. Materials should be ordered and placed on the job so that they can be readily found and placed in position. One of the hardest jobs an employer has to contend with is the handling of men. Good men will only work under good conditions; they do not like to be yelled at, and more or less want to be left alone in their work; supervision is one thing—nagging is another.

Every business to be successful must make money, and it is quite a job to keep the money coming in so as to keep everything going smoothly. Pay day comes around quickly and the men expect their money. A wise contractor must figure ahead so that he will have the money on hand. If payments will not come for some time, other means to get the necessary money for payroll and to meet current bills must be arranged for. Finance is the life blood of any business and especially so in the building business.

Home Building in 1922

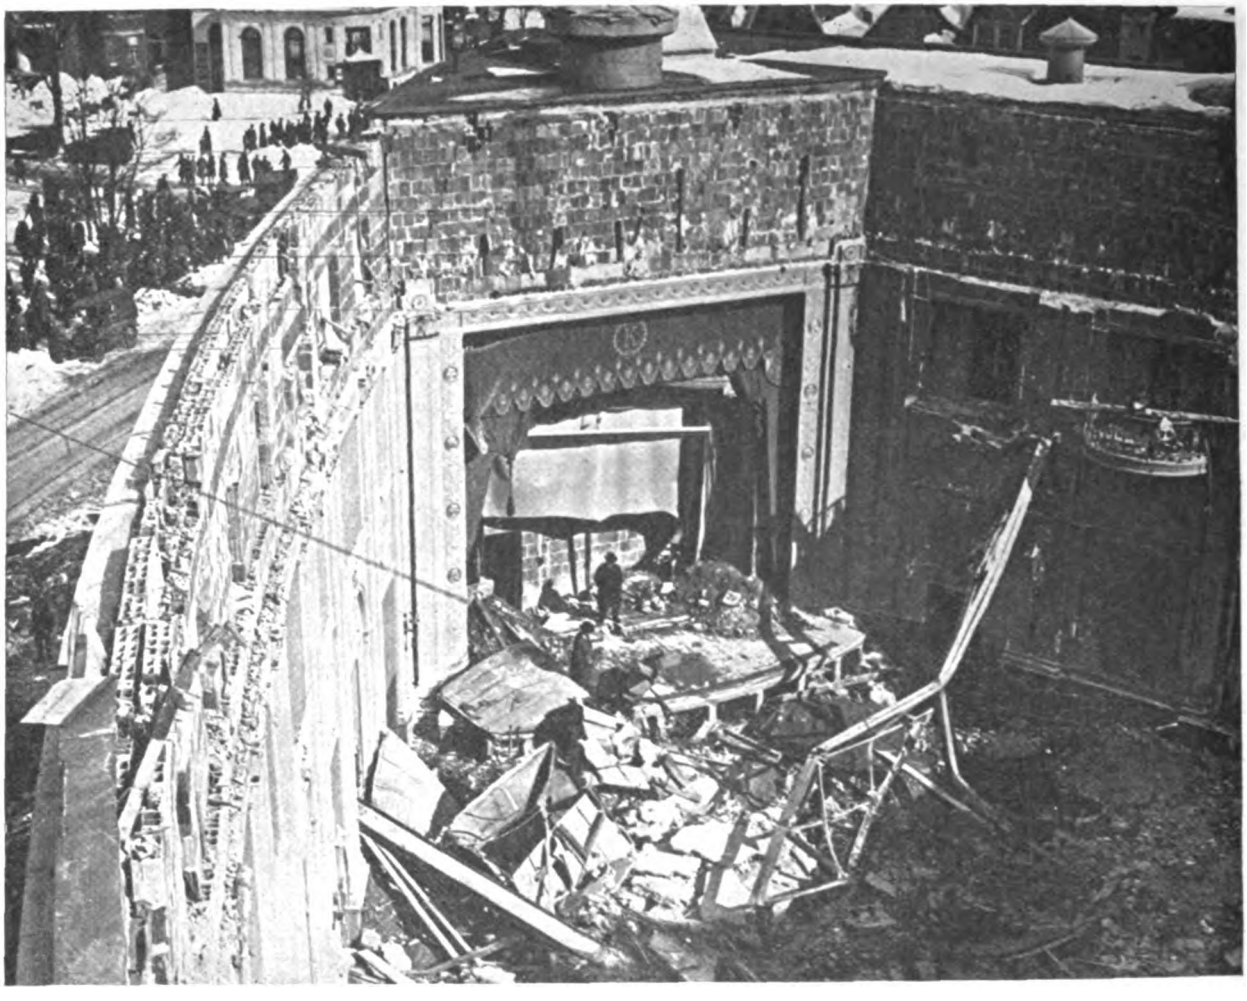
THE Spring building season is only a few weeks off. Many thousands of people have been dreaming of the beautiful home they intend to build some day. It is their ideal, but year follows year and the joys of the new home have never been realized.

The practical builder who is anxious to increase his business will use all means available so as to induce people to build. There is more to be done than just mere suggesting that they should own a home. Practically every one has that desire, but the great stumbling block is to be able to finance it successfully.

Building Comfortable Homes

THERE are many little things that go to make a house comfortable that are too often overlooked by the builder. A home is not a true home unless every comfort is afforded the occupants.

Think a little about how doors swing; many doors are hung in the wrong way, they should swing so that they will give the most convenience. There is no great harm in having a door open into a hall instead of opening into the bedroom or bathroom side where the space inside is limited. We do not open a closet door inwards and there is no objection to it; therefor, why persist in having all doors open into a room when it will mean more convenience to have them open outward? Closet doors should open so that the light from the window or chandelier will not be obstructed when the door is open.



The height of the windows is another important little point that is frequently over looked. Try to ascertain the wishes of your clients. A table is used in most kitchens and too often a window is set too low so that the top of the table is above the bottom of the window, if you have your window sill about 32 inches above floor level it will be about right, and one fault too often found in kitchens will be overcome.

Another point to look out for is to have the lock on the door at a convenient height, often we find it too low for convenience.

Be particular about the little details so as to produce pleasing and artistic exteriors. The trim for doors and windows and other details such as cornices, roof fittings, lattice work, etc., are what makes the appearance of the house. Have the workmanship on these small details exceptionally good.

These are just a few suggestions to impress builders with the importance of looking after the little details of construction, as these are what please the customer and a pleased customer is the best advertisement a builder can have, also it means obtaining the worth while contracts.

View Looking Towards Stage, Showing Wreckage of Roof and One of the Collapsed Trusses. The Hollow Tile Walls Held Up, Showing That Fault Was With Roof Only

COLLAPSE OF THEATRE ROOF

Awful Disaster in Washington Shows the Need of More Knowledge and Care in Design and Construction of Public Structures

LAST month we published a description of the catastrophe of the American Theatre in Brooklyn, N. Y., which collapsed while it was under construction. In this article we mentioned it was providential that it occurred during construction and not after it was opened for business, and we pictured the awful possibilities of a collapse in a theatre crowded with an audience.

Unfortunately a horrible calamity of this sort actually occurred in the collapse of the roof of the Knickerbocker Theatre at Washington, D. C., while an audience was seated enjoying the movies. Several investigations are under way to determine the exact cause of the collapse, but at the present time it is too early to give any reliable, definite facts.

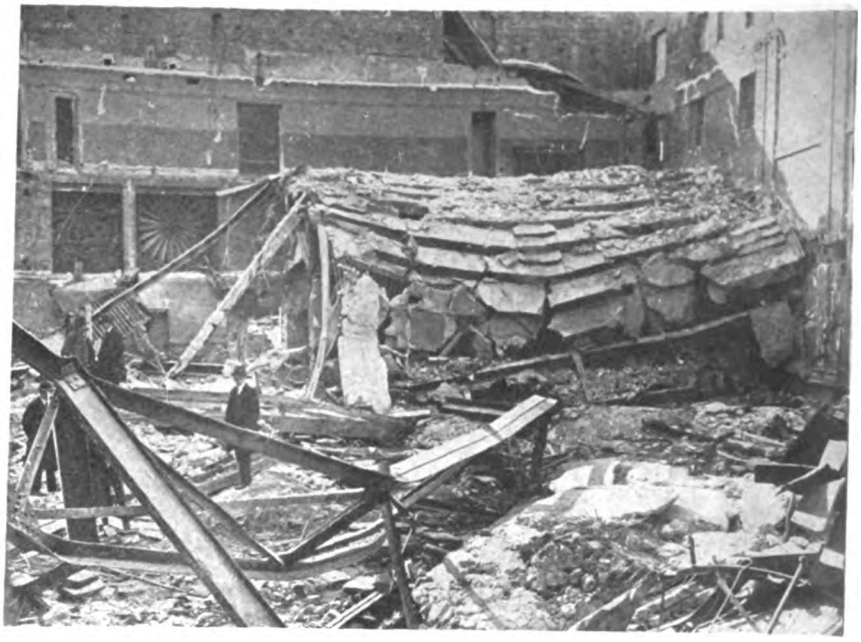
The collapse occurred at 9:20 P. M. on Saturday, January 28th. A severe snowfall of 29 inches had occurred during the day and the most accepted theory is that the weight of this snow was enough to cause the collapse. On the same Saturday the roofs of two other buildings in Washington collapsed from the weight of snow, one being a church and the other a garage, but these disasters were not accompanied with the loss of life as was that of the theatre.

In our January issue we called particular attention that proper care should be taken in the design and construction of roof trusses, etc., over public buildings. Surely the public has a right to be protected from disasters of this nature.

Why would it not be a good plan to actually test roofs, balconies, floors, stairs, etc., of buildings that are occupied for public use? Experimental tests are often made on a small scale, but there is no reason why it should not be carried out on a larger scale and have safety assured. A cantilever balcony could be tested by having one section of it loaded up with pig iron or any other heavy material. Have it evenly distributed so that it will actually be a distributed floor load. If this load be made twice that of the estimated weight which has been calculated to be allowed on it when in use, it can be considered safe. No steam boiler is allowed to be used until it has passed a hydraulic test of a pressure greater than its allowable working pressure. Why could not the same good rule be applied to public buildings?

The Knickerbocker Theatre was

Digitized by Google



located on Columbia Road in the Northwest Section of Washington. It was erected in 1917 from plans prepared by R. W. Geare, architect, of Washington. The walls were built of hollow tile with roof supported by steel trusses, the ceiling being suspended in the regular way from the bottom members. The ceiling was of plaster on metal lath and was ornamented in the manner usually found in high-class modern fire-proof motion picture theatres.

The theatre was located in one of the best residential sections of Washington, and amongst the unforunate victims of the disaster were many people prominent in Washington life. At the time of our going to press 96 people lost their lives with over 130 more or less injured.

The pictures we present show the extent of damage by the collapse, also the form of construction. Many theories have been advanced as to the actual primary cause of the disaster, some have advanced the theory we propounded in our January issue that rhythmatic vibrations may have been the cause.

One interesting theory advanced is based on the fact that the girl organist had just concluded the solo of the intermission between the first and second performances. It is said that the great organ rumbled the finale in strong tones that vibrated through the structure.

The weight of snow is a factor that must always be carefully considered in the design of a flat roof of wide span, and to make sure, the calculations for the strength of the roof should take into consideration those various occasional forces that are apt to come and then a large enough factor of safety used; in other words, the structure should be made strong enough to withstand five or more times the load that has been calculated as the likely load it is to bear; not only the dead load but all possible live loads.

The Only Portion of the Reinforced Concrete Balcony to Partially Remain. One of the Roof Trusses Shown at Bottom of Picture; Note Its Crumpled Condition.

It is certain that no adequate factor of safety was employed; these few pictures are mute but forceful evidence that some awful blunder was made, otherwise a little overload would not cause such a complete collapse.

R. W. Geare, the architect who designed and supervised the construction of the Knickerbocker, declared that he could not account for the collapse.

"I am at a loss to understand what caused the building to cave in," he said. "The theatre was built before the war and the best of materials were used in constructing it. A most thorough inspection was made before it was opened."

Harry M. Crandall, president of the corporation controlling the Knickerbocker Theatre, and A. E. Beitzel and Harry Buckley, officers of the theatre, issued a joint statement. They expressed themselves as stunned. They added:

"The Knickerbocker is the prize of our circuit. Constructed at no limit of cost before the war, when the best material and engineering brains were secured to make this house a model for theatre architecture and construction. The structure was subject to and passed every municipal government inspection and test."

"We cannot find words to express the depth of sympathy we feel for those bereaved by this appalling catastrophe."

Review of Building Situation

CONSTRUCTION activity in December, according to figures published by F. W. Dodge Co., show that the total amount of contracts awarded (not contemplated) amounted to $198,518,300. This is 3% over the November total, but it is 98% greater than the figures for December, 1920! It is the second largest December total on record, and this is certainly a most encouraging sign for building activity this year.

In all districts a substantial increase was shown over that of December, 1920. Despite this good showing in December, however, the year closed with 8% less contracts in money value than 1920. There was, however, more building in 1921 than in 1920, the lowering of costs of material and labor is the reason for this.

Despite lower costs the district around New York spent 7% more money on construction in 1921 than in 1920 and in the Middle Atlantic district the figures are 18% ahead of 1920. There is considerable building on the West coast, the principal amount being around Los Angeles, which is now having a boom, with the exception of Southern California the West and Middle West districts ran behind the 1920 totals.

In the contracts awarded residential building continues in the lead, showing an increase of $10,572,800 over that of November contracts. The total amount of contracts awarded for residential construction is $100,896,700 and $73,527,300 of this amount is to be spent in the Eastern district; that is, New England, New York and Middle Atlantic States.

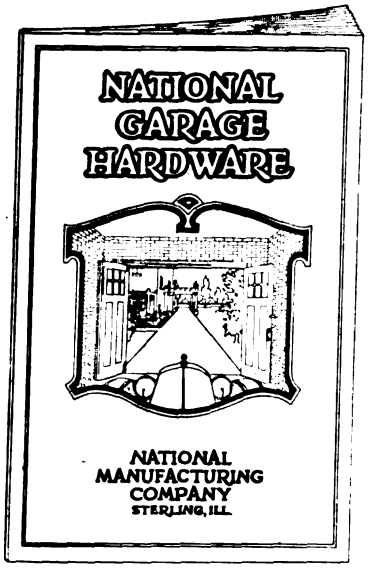
A great many of the above contracts awarded will not be started until this Spring, or as soon as the weather permits. On account of mildness of the winter in some sections, considerable work has already been started.

1922 Building Activity

THE greatest building activity in this country this year will be in the industrial states, according to a forecast of the building outlook recently made by the Committee on Statistics and Standards of the Chamber of Commerce of the United States.

It is pointed out by the Committee that there will be a good many business buildings erected this year, and a large number of them will be in the shape of alterations and enlargements. On the other hand, it says, it is unfortunate that not a great many farm buildings, such as dwelling houses, barns, cribs and the like are contemplated.

The prospects for building in the strictly agricultural states is not favorable. There are several reasons for this, principally the exceedingly low and unremunerative prices on farm products.



Record of December, 1921, Building Contracts Awarded

Classification of Buildings	SECTION OF COUNTRY New England District	New York District	Mid Atlantic District	Pittsburgh District	Middle West District	North West District	Totals
Business	$2,208,400	$6,509,100	$3,430,400	$3,029,800	$6,283,500	$595,500	$22,056,700
Educational	3,496,900	2,752,000	2,168,500	2,385,700	2,971,100	1,272,000	15,046,200
Hospitals and Institutions	400,000	466,500	2,671,500	809,400	1,914,000	82,000	6,343,400
Industrial	966,700	3,857,100	3,774,000	2,523,400	3,020,000	411,400	14,552,600

This Book Free

If you are interested in building a garage (and who is not in these days of automobiles?), you will find a number of valuable suggestions in The National Garage Book, which we want to send you without charge.

The principles, methods and practice of scientific construction of garages to secure beauty and practical utility, together with ease in opening the doors and the fullest protection against all sorts of weather, are completely set forth in this book.

In this book photographs of garages are shown in practically all kinds of structural materials; such as wood, brick, concrete, stucco, and stone. The garages shown cover a wide range, from those of simple design to those of more elaborate proportion.

National Garage Hardware

the equipment illustrated in this book, is essentially practical, has been thoroughly tested under all conditions, and will give long and satisfying service.

Tear out blank now

Legal Department

ALL readers are invited to ask any questions that will help them solve any legal difficulty that they may be in. Our legal adviser will answer direct by mail and give his opinion as to the correct procedure. Questions and answers of general interest to the trade will be published in these columns. All inquiries must be accompanied by the name and address of the correspondent so that he may be answered direct or that he may be requested for further information if necessary to the intelligent answering of his question. No names will be published, only initials or a nome de plume. Remember that this service is free to subscribers. Address Legal Department, Building Age, 920 Broadway, New York City.

To Sue Or Not to Sue; That is the Question

A COLORADO subscriber, who recently consulted us concerning his right to compensation where he furnished plans, etc., for a church structure, but they were not used for some years, and where he did not have any distinct understanding with the church corporation or its building committee concerning his compensation, supplements his inquiry by stating that the building committee now offers to pay $50, and by saying: "I am preplexed as to what under the circumstances is best to do: accept the ignominious offer in self and professional abasement and lay the incident up against experience or sue for a just compensation. I deeply appreciate your counsel and careful advice and would be still grateful for one more word."

Unless a reliable attorney in the city where our friend resides is willing to assure him that there is a good prospect of recovering at least $200 above attorney's fee, expenses of the litigation, etc., I am strongly inclined to advise taking the $50, "and lay the incident up against experience."

As stated in our previous answer to this correspondent, it seems that failure to obtain a distinct written contract with the building committee, and other circumstances, create some doubt in our mind as to whether recovery could be enforced. Acceptance of the $50 will avoid considerable worry and expense, necessarily incident to preparing and attending the trial.

It may sound strange to hear a lawyer say it, but the law editor of THE BUILDING AGE is not deeply impressed with the merits of litigation as a means of venting an aggrieved person's desire for "satisfaction" against one who has dealt unfairly. When we think of "lawing for principle" we always think of the Italian vender of plaster statuettes who resented an affront to the memory of the patriot, Garibaldi. Carrying on his arm a basket containing figures of the world's greatest men, the Italian met on a New York sidewalk an American staggering under a load of intoxicants, and said, "Buy a statue of Garibaldi." The soused one, seizing the cast from the vender's hand, dashed it to the pavement, saying, "To hell with your Garibaldi." Whereupon a volcano of resentment burst from the Italian, who, seizing out of his own basket a cast of the immortal George Washington, dashed it into a hundred pieces on the sidewalk, indignantly shouting, "You say to hella with my Garibaldi. I say to hella with your George Wash."

I do not share the pessimism which believes that if a lawsuit happens to be decided in accordance with equity and justice the result is to be attributed more to chance than to any merit of law or the courts. But I do think that, as applied to controversies which involve but small sums of money, there is much in what Feltham said:

"To go to law, is for two persons to kindle a fire at their own cost, to warm others, and singe themselves to cinders; and because they cannot agree, to what is truth and equity, they will both agree to unplume themselves, that others may be decorated with their feathers."

Those who have had litigious tendencies may agree with what Douglas Jerrold remarked: "The law is a pretty bird, and has charming wings. It would be quite a bird of paradise if it did not carry such a terrible bill."

I approve Quarles' advice that one should "use law and physic only for necessity; they that use them otherwise abuse themselves into weak bodies, and light purses; they are good remedies, bad businesses, and worse recreations."

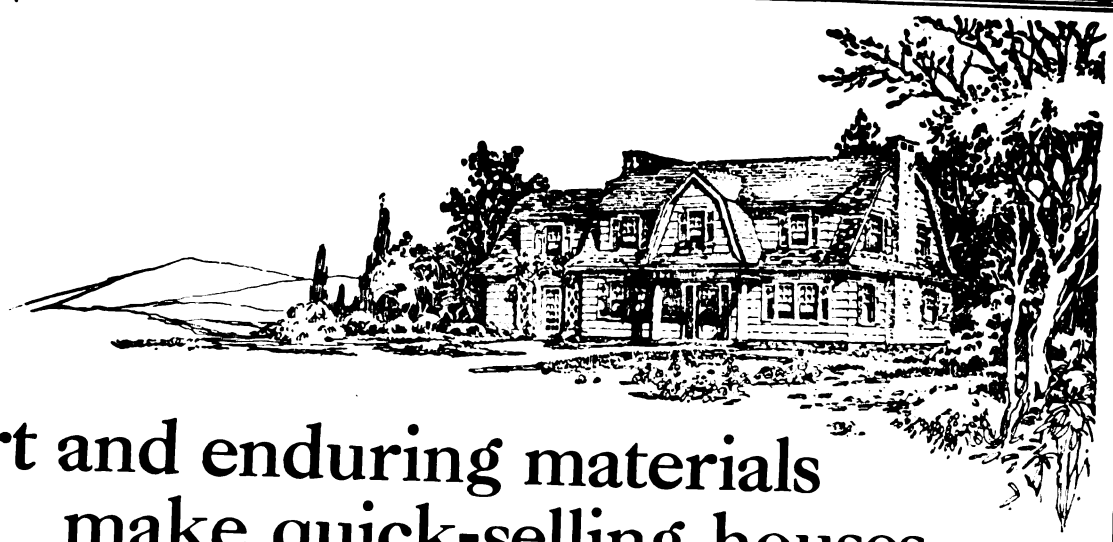
If "satisfaction" is desired where a "religious" congregation refuses to pay an architect's bill and the amount involved is too small to justify litigation, we suggest that the parson be asked to preach a sermon on one of the following texts:

"For the congregation of hypocrites shall be desolate, and fire shall consume the tabernacles of bribery." Job, xv. 34.

"Nay; but I will verily buy it for the full price: for I will not take that which is thine for the Lord, nor offer burnt-offerings without cost." I. Chron. xxi. 34.

"Because he hath violently taken away a house which he builded not; surely he shall not feel quietness in his belly." Job xx. 19, 20.

Substantial Performance Of Building Contracts



QUESTION is frequently raised as to whether a building contractor has substantially performed a contract in such sense as to be entitled to recover compensation, although in some respects the work may be defective or incomplete.

This question was raised before the California Supreme Court recently in the case of Rischard vs. Miller, 188 Pacific Reporter, 50, and was decided in favor of the builder. The court lays down the following rule generally recognized by courts throughout the country:

"If there has been no willful departure from the terms of the contract, and no omission of any of its essential parts, if the contractor has performed in good faith all of its substantive terms, or if the omission is so slight that it cannot be regarded as an integral or substantive part of the contract and the other party can be compensated therefor by a deduction in the way of damages, the contractor may recover whatever is due upon the contract less such deduction, especially in a case where the other party has received the benefit of what has been done, and is enjoying the fruits of the work."

In the California case it is found that there was a substantial performance of a contract for the erection of a house

Art and enduring materials make quick-selling houses

A COMFORTABLE and convenient interior and an exterior that is pleasing in design and constructed of extra-durable materials make quick-selling houses.

Builders who can truthfully assure the buyer that shingles and siding, porch floors and columns, trim, mouldings, water tables, etc., are genuine California Redwood, find it easy to get full price. The rot-resisting qualities of Redwood and its freedom from swelling, shrinking and warping are mighty good selling points.

Many a Redwood shingled roof has lasted in good condition upwards of 40 years. That's the kind of roof you are selling when you use all-heart Redwood shingles without a knot in them. You can get them to suit every architectural requirement.

Redwood siding matches Redwood shingles in rot, insect and weather resistance. Mouldings, window and door frames, porch columns and Redwood mill work of all kinds can be secured for every exterior construction requirement.

For the convenience of architects, builders and construction engineers, we have recently issued two Redwood booklets, our "Construction Digest" and our "Engineering Digest". They will be forwarded to you on request.

Redwood should be specified for

Exterior Construction

Including—Colonial siding, clapboards, shingles, door and window frames—gutters, eaves, water tables and mudsills—porch rail, balusters and columns—mouldings and lattice—pickets and fencing—pergolas and greenhouses.

Interior Finish

Natural, stained or painted.

Industrial Uses

Tanks and vats for water, chemicals and oil—factory roofs and gutters—wood block flooring.

Wood Specialties

Such as—Caskets and burial boxes—incubators and ice-cream cabinets—cigar and candy boxes, etc.

Railroad Uses

Such as—Railroad ties and tunnel timbers—signal wire conduits and water tanks—car siding and roofing.

Farm and Dairy Uses

Such as—Silos, tanks and troughs—hog feeders and implement sheds—wood block floors, etc.

Digitized by Google

at a cost of $2,600, where the defects were remediable at an aggregate cost of about $100 and were of the following described nature: Defect in a concrete foundation wall remediable at a cost of $25. Settling of a pillar, which could be corrected for $10. Variance in size of glass in a cabinet door, curable for $3.50. Piping not as large as specified, but subject to correction for $25. Hat cupboard omitted but obtainable for $5. Substitution of No. 2 flooring in one room for No. 1, but not noticeable excepting on close inspection.

In another recent case it is held by the Court of Appeals of the District of Columbia that on intentional failure of a contractor to observe building specifications, the owner may deduct the entire cost of making the building conform to specifications, and is not required to deduct merely the difference between the value of the work as done and its value if it had been performed as required by the contract. (Turner vs. Henning, 262 Federal Reporter, 637.)

Plaintiff sued to enforce a mechanic's lien for a balance due for constructing a house. The defense consisted of a denial that the building had been erected in conformity to the contract. The trial court found that certain parts of the work did not comply with the agreement, and allowed a deduction from the price to cover reconstruction of those parts. The Court of Appeals affirmed the decision, saying:

"The testimony of the architect, supported by that of several other competent witnesses, satisfies us that the contractor intentionally failed in the respects mentioned in the decree. This is illustrated by the following instances: The specifications called for a concrete floor in the cellar, consisting of a one-inch topping with a three-inch base, making four inches in all. But the floor laid did not have an inch topping and measured only from 1½ to 2½ inches in total thickness. Upon little pressure a pick punctured the surface. If the floor was constructed as the contract required, the pick 'could not have made any more than just a slight impression, and sparks would have responded from the pick,' said the architect of more than thirty years' experience. 'The porch' of the building, testified the architect in charge, 'was to be finished with a master builders' preparation for a red top, but when it was finished it lacked the coloring. It was mottled and a dull red, not the kind he expected. . . . When completed it gave the appearance that lamp black or something else had been worked into it." . . . Appellant repeatedly refused to remedy these defects.

"Under his state of the proof he is not entitled to the benefit of the equitable doctrine of substantial performance. That doctrine 'is intended for the protection and relief of those who have faithfully and honestly endeavored to perform their contracts in all material and substantial particulars, so that their right to compensation may not be forfeited by reason of mere technical, inadvertent, or unimportant omissions or defects. It is incumbent upon him who invokes its protection to present a case in which there has been no willful omission or departure from the terms of his contract." . . .

"Appellant urges that, if the work was defective, the owner should have been allowed only the difference between the value of it as done and the value of it performed in accordance with the contract. Is this sound? The owner did not want a cellar floor, nor a porch such as we have described, and he should not be required to pay for them, but this is what would result if appellant's theory as to the measure of damages is followed. Appellant did not do the things for which appellee agreed to pay him, and he should not be permitted to thrust upon the latter things not substantially the same, but much inferior, even though he is willing to let him have them at a reduced price. . . .

"It was argued that if the owner had removed the defective parts and replaced them according to the contract, he might be entitled to deduct the cost of the replacement; but, because he did not do so, but is keeping these parts and using them, he should pay their value. We cannot accede to this. Appellee [the owner], after appellant had refused to perform his contract, had his election either to use those parts or take them up and throw them away. Neither course would result in any benefit to the appellant; therefore, he could not be injured by the appellee's taking the one course rather than the other. If the latter could return to the appellant the defective things, the rule might be otherwise, but obviously he could not do so. To remove them would be to destroy them.

"To enjoy the house for which appellee had paid nearly $8,000, he was compelled to use, more or less, the defective parts. This did not work an acceptance of them, since they were negligible as compared with the whole, and he repeatedly said to the appellant that he would not accept them. Equity will not penalize him, in the circumstances, by compeling him to pay for that which he does not want."

Who Bears Labor and Material Cost Advances?

THE Owner and Builder have signed an agreement that the work in question is to be done on a cost plus 10% basis, but that the total cost shall not exceed a certain sum. The point the Owner questions is, would he be legally obligated to the Builder for any increased prices in labor and materials, during the progress of the work, due to abnormal conditions? The work was started September, 1919, and finished approximately October 1, 1921. In signing the contract, the Builder was cautioned concerning unforeseen conditions and he understood fully the conditions that confronted him, and he included a certain amount for protection.

O J. M., Chicago, Ill.

On the facts presented, the Owner is not obligated to the Builder for any increased prices in labor and materials. It would take an express agreement to hold the Owner to such obligation. The Builder undertook to build the structure according to certain specifications for a price not to exceed the specified maximum sum. He impliedly guaranteed that a computation of the price on the cost plus 10% basis would not result in a higher figure than the maximum sum fixed. If he desired to qualify this guaranty by imposing a condition that increases in labor and material costs—whether expected or unexpected—should be used as a basis for increasing the price for the building on actual cost plus ten per cent. exceeding the maximum specified in the contract, he should have insisted on that condition being expressed in the contract.

"Where the contract contains an express stipulation as to the amount of compensation, such stipulation is conclusive on the parties, and measures the amount of recovery for performance." 13 *Corpus Juris*, 585.

"By the strict common-law rule, a builder who has improvidently assumed an absolute liability when he might have undertaken a qualified one only, is not excused from performing his engagement, unless he is prevented from doing so by reason of performance becoming impossible by a change in the law, by the destruction of the specific thing which is essential to the performance of the contract, or by the non-existence of conditions essential to performance. *No hardship, no unforeseen hindrance, no difficulty will excuse him from doing what he has expressly agreed to do.* Thus a contractor is not excused from performing, according to the terms of the contract, because of defective or mistaken plans, of mere difficulty in performing, *or of unusual or unexpected expense;* or because of his inability to perform, not due to any wrongful act or omission of the owner; or because the contract would not be profitable to the owner, or would be useless under the existing conditions; nor is he excused because of latent defects in the soil conditions, unless the testing of the soil is exclusively within the control of the owner or architect. . . . A contractor's mistake in supposing that no license was required to work where he desired to is no excuse for his failure to perform." 9 *Corpus Juris*, 805-806.

It is really immaterial whether either party to this contract foresaw the possibility of labor costs and material prices advancing. But, of course, the fact that the Builder was cautioned by himself or some one else to take heed of the possibility of costs and prices mounting higher, is a circumstance in the Owner's favor.

Trend of Material Prices

THE following are wholesale prices of basic building materials in the three markets which set prices for the rest of the country.

These prices are presented to show the trend of the wholesale market, which forecasts prices in the retail market. They are not prices which the average contractor can buy at, but are quoted to show him the movement of materials so that he can buy to better advantage.

Followed in conjunction with the Review of Building Conditions, these prices will prove invaluable.

All prices are for carload lots, F. O. B. market quoted, unless otherwise noted.

It's Going Big!

"ANY time anybody shows me how to make three brick houses grow where only one grew before, I'll grab it.

"What if the Ideal wall does cut down the number of brick used on each job and makes the job run $300 to $400 less on material and labor?

"That's to my advantage. It means a lot more of brickwork. Why? Because it lets me prove to people that a brick home costs less than any other kind.

"I'm able to offer good, old reliable brick construction — which everyone likes and which doesn't require any painting and repairs and means less insurance—for the price of frame construction.

"It's going big. Take a tip from me and any of you fellows who are not on to this kind of construction should get the facts and get in on the ground floor."

The adjacent column describes this kind of Ideal wall construction about which Pat is so enthusiastic.

Simple and easy to lay up the Ideal Wall

What the Ideal Wall Means to Builders

It's a fact, you can now produce brickwork — real-honest-to-goodness brick construction at a lower cost than less enduring and less attractive construction.

And it's going to mean lots more work because everybody likes brickwork and when they find out they can get it for the price of frame, there's going to be lots more of this work done.

The Ideal Wall saves one-third in cost of brickwork and makes brickwork the lowest in cost of any construction.

The brick—any standard brick—are laid on edge, as shown in the illustration, thus producing a wall which combines the advantages of the solid brick and hollow type at the lowest cost. Any mason can lay it.

In addition to the 8-inch wall shown, 12-inch and 16-inch thicknesses are obtained by different combinations—all simple and easily handled.

Be Sure to Secure This Important Information

Here's a book that describes this construction. It's called "Brick, How to Build and Estimate." New, revised third edition. Thousands of builders are using this valuable manual. It's full of data, tests, tables about brickwork. 25 cents postpaid.

Another book that's a wonderful aid to contractors in interesting people in brickwork is "Brick for the Average Man's Home"—72 pages. The variety of design and drawings in the 35 homes illustrated are very unusual. *For all these designs complete working drawings are available at small cost.* You'll find this a decidedly valuable book. $1.00 postpaid. Send $1.25 to the Common Brick Manufacturers Association, 1308 Schofield Building, Cleveland, and receive both books. The nominal price asked is to cover printing and distribution costs only. You'll never regret securing these valuable publications.

Selected List of Manufacturers' Literature

FOR THE SERVICE OF BUILDERS, CONTRACTORS, ARCHITECTS AND ENGINEERS

The publications listed in these columns are the most important of those issued by leading manufacturers identified with the building industry. They may be had without charge, unless otherwise noted, by applying on your business stationery to Building Age and The Builders' Journal, 920 Broadway, New York, or the manufacturer direct, in which case kindly mention this publication. Either the titles or the numbers may be used in ordering.

Listings in this Department are available to any manufacturer at the rate of $5 per listing per month.

ANCHORS—See Bolts

ARCHITECTURAL IRON WORK—See also Ornamental Metal Work

The Hughes-Keenan Company, Mansfield, Ohio.

5. *Catalog No. 5.* Contains descriptions of Pressed Steel Stairs, Ornamental Iron, Fire Escapes, Steel Door and Window Frames, Pressed Steel Toilet Partitions. 65 pp.

ASBESTOS PRODUCTS

Asbestos Shingle, Slate & Sheathing Co., Ambler, Pa.

Ambler Asbestos Shingles. Catalog, 5½x5½ in. 40 pp. Illustrated.

Ambler Asbestos Corrugated Roofing and Siding. Catalog. 8½ x 11 in. 36 pp. Illustrated. Standard Purlin Spacing Tables.

Ambler Asbestos Corrugated Roofing and Siding. Catalog. 8½ x 11 in. 20 pp. Illustrated. Prices and specifications.

Ambler Asbestos Building Lumber. Catalg. 8½x11 in. 32 pp. Illustrated.

Engineers' Data Sheets. Catalog. 8½x11 in. 40 pp. Illustrated. Specifications and working sheets for Ambler Asbestos Corrugated Roofing and Siding.

Johns-Manville, Inc., Madison Ave. and 41st St., New York, N. Y.

Johns-Manville Asbestos Wood. Booklet. 3½x6 in. 32 pp. Illustrated. Prices, construction data. List of uses for asbestos wood.

Catalog No. 304. A treatise on the manufacture and uses of Johns-Manville Building Materials made of asbestos and mastic for all places exposed to fire or corrosion. 100 pp. Ill. in colors. Board covers. 8½ x 11 in.

ASBESTOS ROOFING—See also Roofing

ASH HOISTS—See also Hoists

Gillis & Geogrogan, 545 West Broadway, New York, N. Y.

36. *General Catalog.* Contains specifications in two forms, (1) using manufacturer's name, and (2) without using manufacturer's name. Detail in ¼ in. scale for each telescopic model and special material handling section. Fully illustrated with photographs of actual installations and descriptive matter of same. 20 pp., 2 colors, 8½ in. x 11 in.

ASH RECEIVERS

Sharp Rotary Ash Receiver Corporation, 396 Bridge St., Springfield, Mass.

Catalog E. Booklet describing the Sharp Rotary Ash Receiver with illustrations of houses in which the furnaces are equipped with this device. 24 pp. Ill. 6 x 9¼ in.

Catalog F. A booklet for architects and builders telling what the Sharp Rotary Ash Receiver is and what it does; together with tables of dimensions for installation. 8 pp. Ill. 6 x 9¼ in.

BALANCES, SASH

Caldwell Mfg. Company, The, Rochester, N. Y.

Suggestions for the Present-Day Architect. Booklet. 6 x 9 in. 16 pp. Illustrated. Gives full-size dimensions and information for the purpose of writing specifications for Caldwell Sash Balances.

Pullman Mfg. Co., Rochester, N. Y.

Catalog describes new form of sash balance that can be removed and inserted without removing sash from window.

BAND SAWS

American Saw Mill Machinery Co., Hackettstown, N. J.

Catalog No. 22 describing a general line of band saws of various sizes.

Technical Data. Four-page folder 8½ x 11 in. containing specifications, description, prices and approximate cost of installation. Everything the architect or contractor requires. Proper size for filing.

BAR BENDERS AND CUTTERS

Koehring Company, Milwaukee, Wis.

Four-page folder, giving illustrations and sizes of Koehring Bar Benders and Cutters.

BEDS

Murphy Door Bed Company, Majestic Bldg., Chicago, Ill.

BOILERS—See Heating Equipment

BOLTS

National Lead Company, 111 Broadway, New York, N. Y.

Cinch Bolt Booklet. An illustrated booklet of Cinch Bolt Specialties. 20 pp. 3½ x 6¼ in.

BOOKS

American Technical Society, Chicago, Ill.

Architectural House Planning Service Co., 20 So. 18th Street, Philadelphia, Pa.

Arrow Book Company, 347 Fifth Avenue, New York City.

U. P. C. Book Company, 243 West 39th Street, New York City.

Frank R. Walker Co., 2209 B Archer Ave., Chicago, Ill.

Western School of Estimating & Plan Reading, Inc., 210 West 13th Avenue, Denver, Colo.

BRICK

American Face Brick Association, 110 South Dearborn St., Chicago, Ill.

The Story of Brick. Contains the history of, and basic requirements of building brick, artistic, sanitary and economic reasons, comparative costs, and fire safety with photographs and drawings, and illustrates ancient and modern architectural works of note in brick. Size 7 x 9¼ in. 56 pp.

OAK FLOORS

(For Everlasting Economy)

Red Cross National Headquarters, Washington, D. C.

Strand Hotel, Atlantic City, N. J.

N. J. Rich Factory Cleveland, Ohio

More Desirable Here Than in the Home

The average person wants Oak Flooring in his home. He has been educated to its beauty and durability, its sanitary and easy-to-clean features. But he is, perhaps, interested in durability least of all.

The owner of public and semi-public buildings, however, is concerned with the wear and tear of thousands of feet, with monthly bills for cleaning and maintenance. To him Oak Flooring is a far-reaching economy.

It means just so many thousands of dollars off maintenance costs during the life of the building. It increases selling and renting values from 25% to 50%. It is an investment bringing sure returns.

Oak has proved its advantages in thousands of churches, schools, coliseums, factories, offices, apartments, hotels — where traffic is heavy and cleaning a big item. And today's prices are ½ to ¾ lower than a year ago—a drop of over 70% —another reason for Oak Flooring in *all* classes of buildings.

ED. F. FANNING, Architect

A FISKLOCK HOUSE

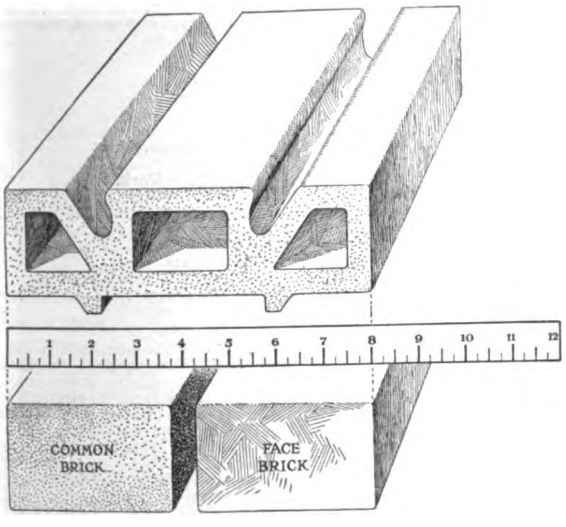
A Better Brick House

at the cost of frame

Your prospective home-owner wants a brick house, he appreciates its greater beauty, its greater comfort, its fire-proofness.

He can have it. Engineering gives him a house of first-quality **face** brick at the cost of frame; just as engineering has given him the telephone, the electric light, the automobile.

"Fisklock" Saves Labor Cost. You know that about one-half the labor cost of a brick wall is the labor cost of the brick backing. This can be saved. "Fisklock" is 8 inches wide—equivalent to a face brick and a common brick.



"Fisklock" is a Better Wall. It is warmer and dryer. Air cells are efficient heat insulation, and the small closed cells in "Fisklock" are more efficient than the large spaces in some walls.

The air cells reduce weight—with "Fisklock" freight and truckage charges are less than for the material for a solid brick wall.

Every construction around window and door frames, beams, and corners, is easily worked out by combining with "Fisklock" a few solid brick of the same texture and color tones.

Write for booklet "Fisklock" Construction, which shows how this wall is laid up, and how all constructions are worked out.

Engineering re-shaped brick. The new shape, "Fisklock," makes a better house and so reduces labor cost that you can build of "Fisklock" from practically any plan at the same price as frame.

"Fisklock" is as easily handled as a common brick. It is light ,and has the 4-inch hand hold to which the mason is accustomed.

FISKE & COMPANY, Inc.
BOSTON, MASS.

NEW YORK **WATSONTOWN, PA.**

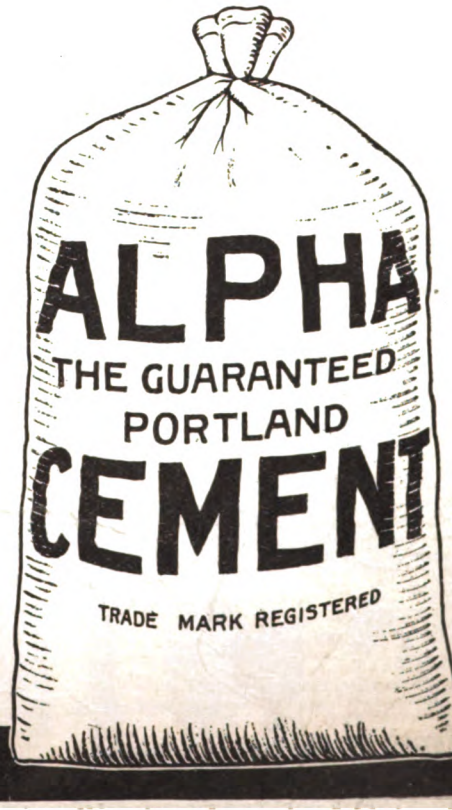
GET YOUR COPY OF THIS HELPFUL HANDBOOK



Just a few pages of it are devoted to telling how we make ALPHA CEMENT under a system of hourly tests so that we and all ALPHA CEMENT dealers can guarantee every bag to meet standard requirements as to fineness and strength. It is unnecessary to test ALPHA CEMENT.

The remainder of the 104 pages of this book are devoted to details and illustrations of a great variety of cement improvements, telling what you ought to know about mixing, reinforcing, placing and curing so as to get the best results.

We have authorized your local ALPHA CEMENT dealer to present you with a copy of this valuable book, also a Service Sheet or Special Bulletin giving working details on any of the following constructions:

Workingmen's Homes
Walkways and Driveways
Cement Roads
Bridges and Culverts
Foundation and Hatchway
Gutter and Curb
Storage Cellar
Small Warehouses
Spring House
Small Dam
Milk House
Manure Pit
Septic Tank
Oil Storage Tank
Tennis Court
Inclosure Walls
Barn and Silo
Cement Blocks
Corn Crib
Poultry House
Storage House
Smoke House
Hog House
Dipping Vat
Tanks and Troughs
Piers for Small Boats
Garden Furniture
Greenhouse
Coal Pocket
Posts and Walls
Walls, Sills and Lintels
Garages and Runways
Overcoating of Old Dwellings
Cold Weather Concreting
Cement Chimneys and Fireplaces

Be sure to get valuable help by asking for the ALPHA literature.
If your dealer's supply is exhausted, he can get more from us.

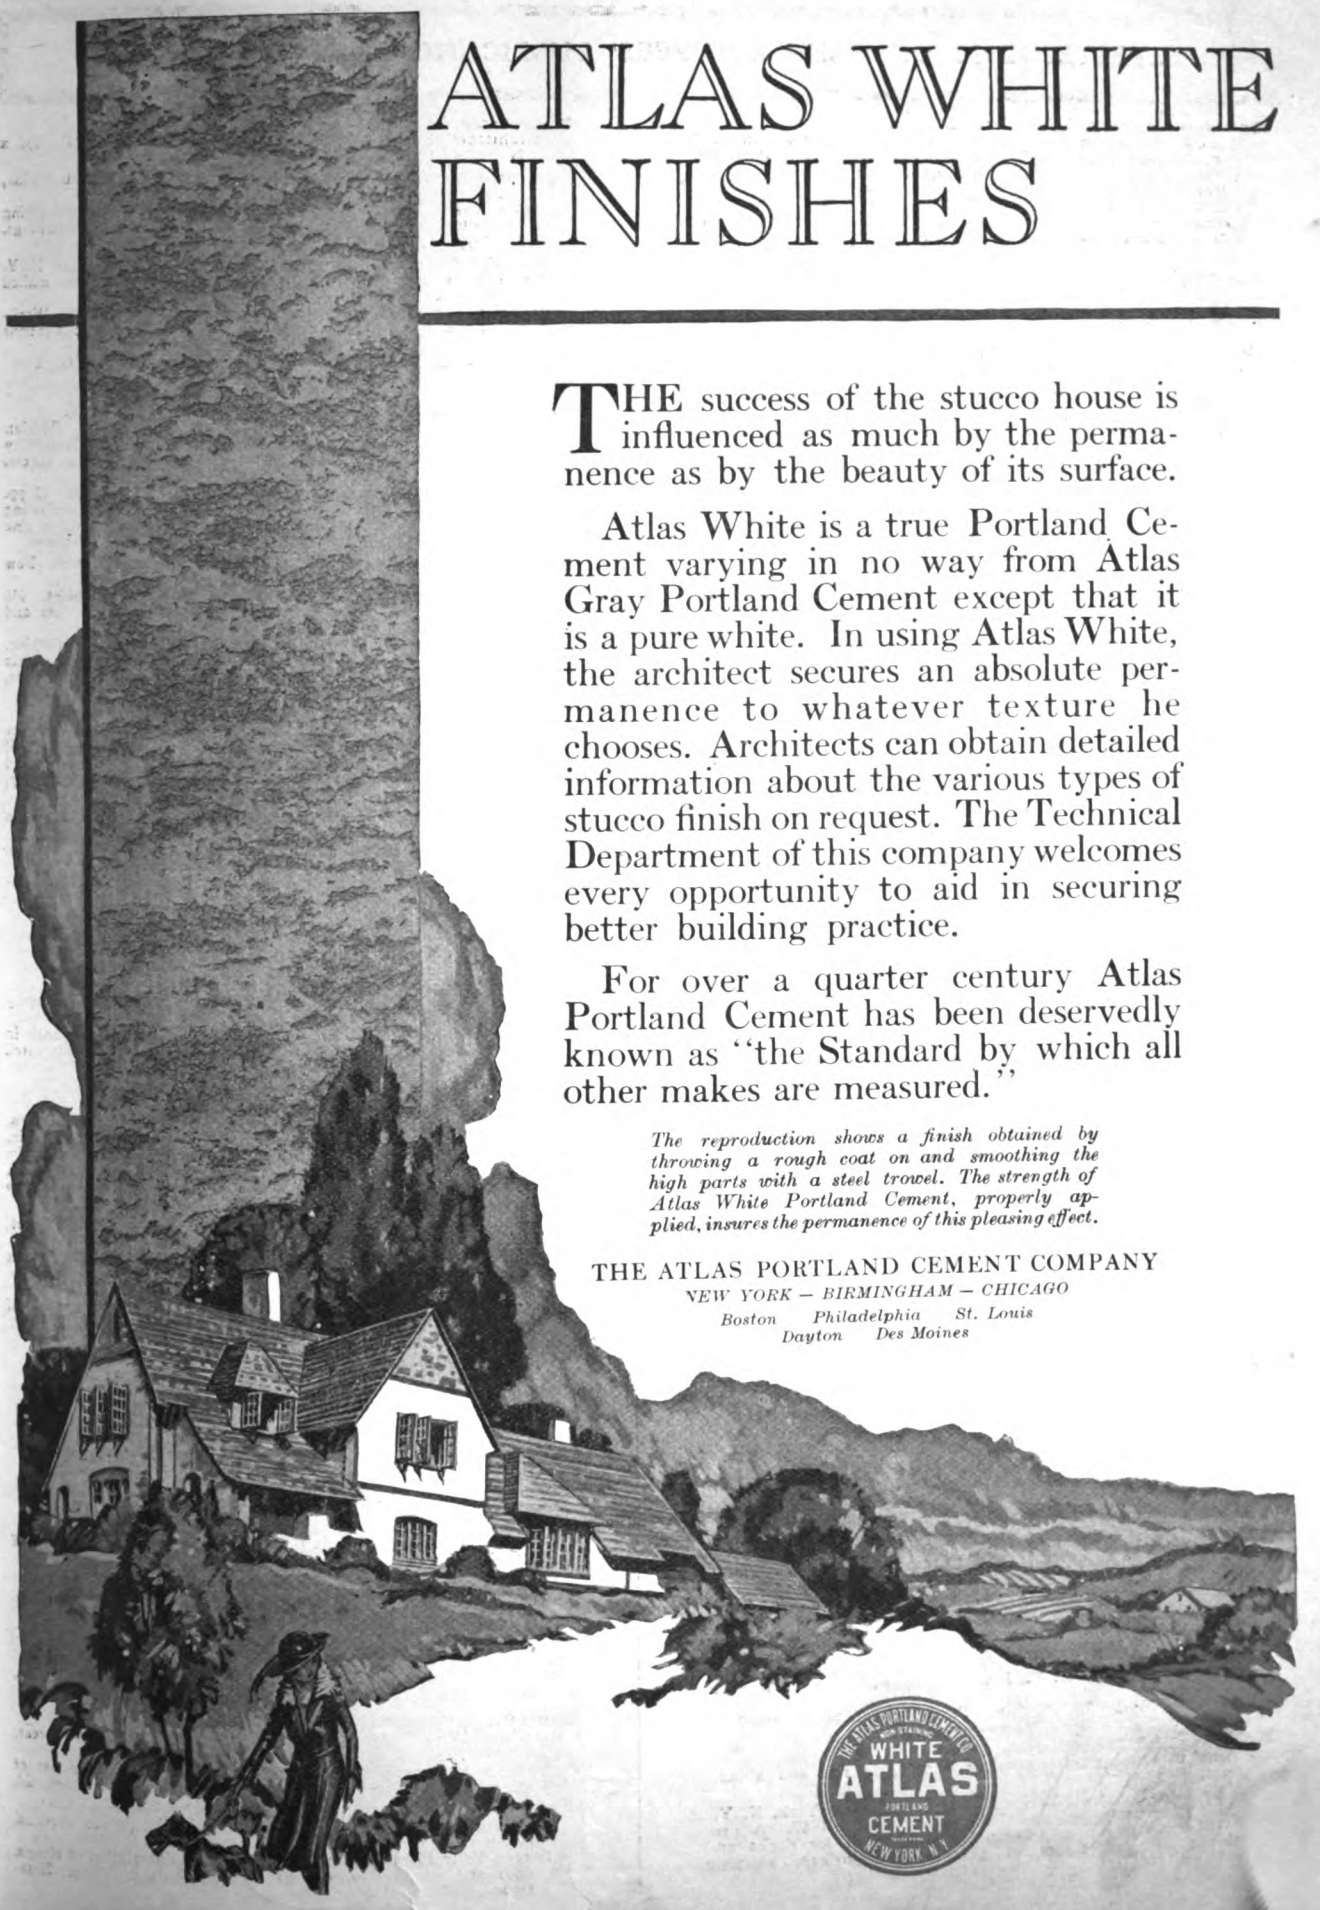
ATLAS WHITE FINISHES



THE success of the stucco house is influenced as much by the permanence as by the beauty of its surface.

Atlas White is a true Portland Cement varying in no way from Atlas Gray Portland Cement except that it is a pure white. In using Atlas White, the architect secures an absolute permanence to whatever texture he chooses. Architects can obtain detailed information about the various types of stucco finish on request. The Technical Department of this company welcomes every opportunity to aid in securing better building practice.

For over a quarter century Atlas Portland Cement has been deservedly known as "the Standard by which all other makes are measured."

The reproduction shows a finish obtained by throwing a rough coat on and smoothing the high parts with a steel trowel. The strength of Atlas White Portland Cement, properly applied, insures the permanence of this pleasing effect.

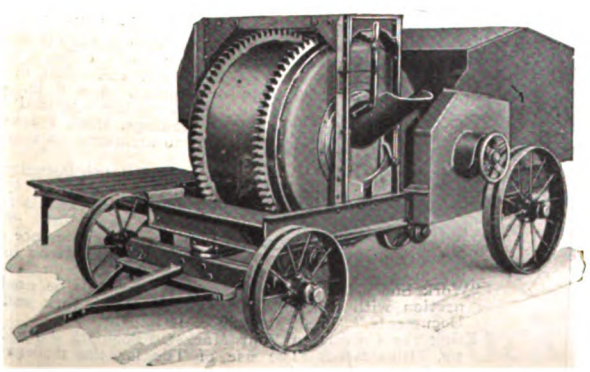
KOEHRING DANDIE MIXER

Don't misjudge this mixer by its price

It sells well within the price range for light mixers—and that is just where you may think it represents about the same value to be expected in mixers at the price. No!



This is a light mixer of extraordinary dependability and long service. It is built in big quantities, every part standardized. That's what keeps quality up, and price down. It is Koehring engineered and Koehring constructed, the same as the big paving mixers, and big heavy duty side loaders. Dependability is the greatest thing you can buy in a mixer—and here it is as it has never been before in a light mixer. You will save yourself money on many a job, if you will write for the Dandie Catalog. Write today.

KOEHRING DANDIE CAPACITIES

4 cu. ft. mixed concrete—gasoline.

7 cu. ft. mixed concrete—steam and gasoline.

May be equipped with power charging skip, low charging platform, automatic water measuring tank, and light duty hoist

Clark & Arms, Architects, New York

Cabot's Creosote Stains

Preserve Your Shingles—Rich, Velvety, Lasting Colors

You are sure of beautiful coloring, durable wearing qualities and thorough preservation of the woodwork if you insist upon Cabot's Stains. Their colors are the strongest and finest natural pigments, ground in pure linseed oil and mixed in specially refined creosote, "the best wood preservative known." They will not wash off or blacken, and are the only stains that are not dangerously inflammable.

Cabot's Quilt

A scientific heat insulator and sound-deadener that makes houses warmer in winter and cooler in summer and deadens sound in floors and partitions. Not a mere felt or paper, but a non-conducting mat that is about thirty times warmer than common papers.

You can get Cabot's Stains and Quilt all over the country. Send for samples and names of nearest agents.

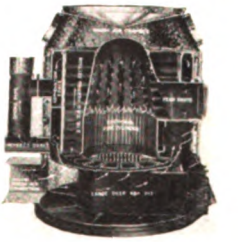
Heated and ventilated by a Kelsey Warm Air Generator.

The Economy of Kelsey Health Heat

If we were to tell you how little coal the Kelsey Warm Air Generator consumed in heating a house of any given size, you would be inclined to think we were making exaggerated claims.



But if you are interested, we shall be glad to tell you, not what we claim, but the experience of people who have used the Kelsey for years.

The Kelsey is unique in its system of circulating the hot gases on all four sides of its zigzag tubes, imparting so much of the heat to the fresh air that passes through them, that very little heat goes up the chimney. It goes where it belongs—into the house. In fact the smoke pipe is so cool that it can be touched with impunity.

Let us tell you how little it will cost for fuel to keep the house cozy, filled with a constant supply of warm, fresh humidified air, improving the health and decreasing the expense account.

Our Engineering Department will furnish detailed plans and specifications insuring satisfactory installation.

Let us send you Booklet No. 5.

ISOMETRIC DRAWING
Showing steel joist floor construction.

The panels above show the effect of basement fires on a wood floor as compared with a Steel Joist Floor. Lower panel shows Steel Joist Floor detail. Over 2,000 dwelling fires occurred every week last year. Most of them started in basements.

The Enemy Within

EVER since life came upon earth there has been enmity. Man has his enemies. Animals have their enemies. Birds, trees, fish—all have their enemies.

And that building that shelters you and yours has its enemy, too. It ever lurks within that home, eager to devour it together with your loved ones and treasured possessions.

We call that enemy **FIRE**. You dread it. And yet you foster it. You build with inflammable materials and thus place food in its path throughout your home. When it attacks you, you fight it. It's usually a losing game. Don't fight fire out—build it out.

Perhaps you, like many others, have always thought firesafe construction too costly for homes. You approved it for office buildings, theatres, etc., but you felt that you couldn't afford it. That may have been true in years gone by. But it's not true today.

Basement walls are fireproof. But if you cover your basement with a wood-beam floor you encourage the home's destruction. Build a Firesafe First Floor over those fireproof basement walls and cut off from the livable sections of your home the fire hazards located in the cellar.

The cost of this simple construction is little more than common wood-beam floor construction. National Steel Joists are as light as wood beams and as easily handled. Many millions of square feet of floor space have been built with these steel joists in dwellings, schools, office buildings, apartments, etc. Stocks of National Steel Joists are carried by most structural steel companies throughout the country.

Send us a pencil sketch or picture of the residence, store or other building you are planning and blueprint layout, list of materials, estimate, etc., will be furnished without charge. We have a pamphlet for contractors giving safe loading tables and details. Shall we mail you one?

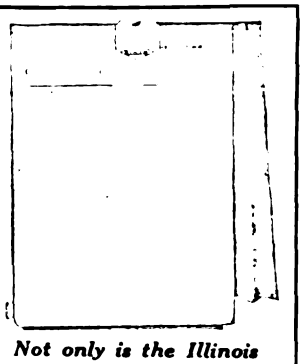
ZINC SHINGLES



Just One Roof In Your Locality Covered With These Shingles—Proves Successful Results

When you investigate ILLINOIS ZINC SHINGLES you will find that they meet requirements and give a service that is not only remarkable, but also offers an opportunity to correctly minimize costs.

However, if you just cover one roof in your locality with ILLINOIS ZINC SHINGLES you will fully realize how they are unlike any metal roofing ever offered you—this one roof will demonstrate their superiority.

This one roof will also show how ILLINOIS ZINC SHINGLES produce a roof of butt-shingled effect.

This sample roof can be used as the basis of costs and appearance for all your future work. You can prove the result of ILLINOIS ZINC SHINGLES being pure zinc (not coated or plated). You can demonstrate their superiority for lightness of weight.

Not only is the Illinois Zinc Shingle everlasting—not only is it artistic—but it's the most convenient and practical form of shingle ever devised.

You can see how they are as beautiful (and in many cases more so) than the tile, slate or wooden shingles or those made from asphalt or substitute materials.

NEVER WEAR OUT

This one roof will show you why they produce "The Roof That's Always New." Investigate; write for sample, manual and other data.

NoKol is on the Underwriters Laboratories' list of approved appliances.

NoKol is in use in more than six thousand homes in all parts of the country.

NoKol belongs in every modern home— and fits any type of heating plant

Heating comfort was made actual by NoKol, just as lighting comfort was made actual by electricity. NoKol belongs in every modern home just as electricity belongs in every modern home.

NoKol heat is automatic, controlled by a thermostat. The temperature in a NoKol heated home does not vary, no matter what the weather is, or how rapidly the temperature outside may rise or fall.

NoKol uses only the amount of fuel necessary to maintain the temperature desired. Much of the time during the changing weather of spring and fall, NoKol uses only a nominal amount of fuel. NoKol is economical in operation.

NoKol rids the home forever of the dirt, discomfort, and drudgery of coal heating. It does away with all furnace attendance, coal dust, and ashes. NoKol burns kerosene, with a sootless, odorless flame.

Installing NoKol is a simple matter. The grate bars are removed and the NoKol burner is set in place of them. Connection is made with the fuel tank, the necessary adjustments are made, and NoKol heat is ready to turn on. No alteration of the furnace is made, whether it be a steam, hot air or hot water plant. The whole job requires less than a morning's work.

NoKol is the greatest single element of comfort a home can have. The whole story of NoKol will gladly be sent to anyone requesting it.

American "Jewel" Bench Planer

American "Variety" Tilting-Table Saw Bench

American "Universal" Saw Bench

American "Triumph" Planer, Matcher and Moulder

"Furnishes All Necessary Mill Work"

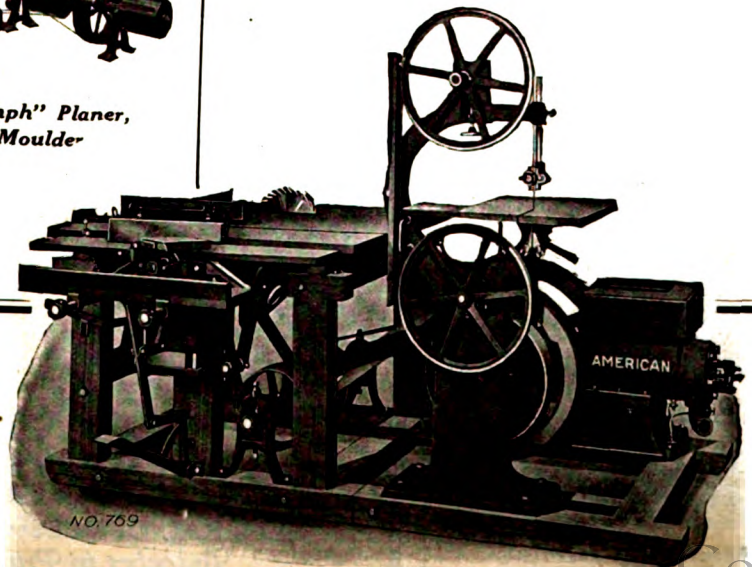
THAT is what Frederick Skon, a carpenter and builder of Jersey City, N. J., says about the American Contractors' Variety Woodworker.

His letter is as follows:

> "The Contractors' Variety Woodworker has proven very satisfactory in my shop. I cannot say what department the machine has proven most useful in, as the rip-saw, cross-cut saw, jointer and mortiser are in constant use by two men in my shop. I think it is sufficient recommendation for the machine to say it furnishes me with all necessary mill work."

Hundreds of contractors, builders and carpenters, the country over voice the same enthusiasm on the all around utility of the "American" Contractors' Variety Woodworker.

Put an "American" in your shop and from the start it will prove a dividend paying investment in time and labor saved and volume of work turned out.



Write for Bulletin No. 77 that fully describes the "American" Contractors' Variety Woodworker and our line of woodworking machinery.

Practical Books

for

Carpenters and Builders

Hick's New Builders' Guide

This standard book has just been revised and brought thoroughly up-to-date by the addition of much new material. It authoritatively covers masonry, hollow tile, estimating, roof framing, etc. Recommended by experienced men as the best modern text book for apprentices and journeymen. Full of practical "short cuts." A section of the book is devoted to tables which save considerable time that otherwise would be spent in lengthy figuring.

Contents by Chapters: Layout of Site, Excavating, Sheet Piling and Pumping. Shoring and Underpinning. Stone Masonry. Water-proofing Foundation Walls. Concrete Construction and Forms for Concrete Footings and Foundation Walls. Brickwork. Hollow Tile Construction and Costs. How to Do Stucco Work on Metal Lath, Brick and Wood Lath. How to Lay Out and Build Fireplaces. Chimney Design and Construction. House Framing. Roof Framing. Mitering Planceers, Mouldings, etc. Carpentry and Construction Kinks. Metal Ceilings and Walls. Estimating Quantities of Materials. Estimating Labor on Carpentry. Estimating Brickwork. Short Cuts in Estimating Forms, etc. Miscellaneous Tables. 360 pages, 4½x7 inches, 300 figures. Flexible fabrikoid, $3.00.

Arthur's Estimating Building Costs

A book giving short cuts for estimating materials, output of labor and costs for all kinds of building work. The tables are especially reliable.

The book begins with the excavation, and ends when the house is finished. The chapters are: Excavations and Piling, Concrete, Brickwork, Stonework, Plastering, Metal, Roofing, Painting, Plumbing and Heating. Miscellaneous includes Hardware, Electric Wiring, Tiling, Bonds, Tables, Rafters, Cisterns, Weights, Comparisons of Cost Between Brick and Frame Buildings; Hints on Drawings. 228 pages, 4½x7 inches, 29 figs., 91 tables. Cloth, $1.50.

THE NEW KIDDER
Architects' and Builders' Book

Everyone in the Building field uses "Kidder's Pocket Book," and this new edition is larger and better than ever. Prof. Nolan and the other authorities, who have worked with him in the revision and rewriting of the various chapters, have described the latest improvements in the methods and equipment.

They have quoted from many authentic sources as well as giving results obtained in their own daily practise. Every item has been carefully checked and rechecked to see that it is technically correct, and the aim throughout has been to present clearly and concisely, and in the least possible space, all the information that is likely to be required by the architect, builder, structural engineer, draughtsman, or contractor, including data for estimating the cost.

The New Kidder has 1900 pages of text, over 1,000 specially prepared diagrams and numerous tables. It is furnished in an attractive flexible binding with gold edges. $7.00.

Distinctive Country Homes

A collection of 100 plates of distinctive homes with views of exteriors, doorways, gates and windows and floor plans. They range from the small house for a suburban plot to the more pretentious villa, with a good selection in all cases. 100 plates, 10x12 inches in double envelopes. $4.00.

McCullough's Practical Structural Design

A complete system for the design of beams, floors, girders, trusses, columns, walls, foundations, footings, etc. The big feature of the book is that no knowledge of algebra or higher mathematics is necessary to understand the explanations, for all calculations, etc., are presented in the form of the ordinary arithmetic that every builder knows. The book contains the most approved practice of up-to-date offices and is profusely illustrated. 320 pages, 6x9 inches, 200 figures. Cloth, $3.00.

Arthur's Home Builder's Guide

A treatise for those about to build, covering the selection of the site, the planning of the rooms and proper materials to use in construction.

Contents by Chapters: The "Lay" of the Land. The Planning of the Home. The Big Four. A Firm Foundation. The Framework. Covering and Adorning the Frame. The Bungalow. Brickwork. Cement Stone—and Mere Stone. Lath and Plaster. Sheet Metal Work. The Interior Finish. Plumbing and Gasfitting. Ventilation. Heating and Lighting. Painting. Finish Hardware. An Analysis of an Ideal Plan. Tornado Construction. Wind Bracing. 144 pages, 5x8 inches. Cloth, $1.00.

Assures Better Windows

TODAY'S windows are vastly better than the low grade windows so common a generation ago. For this, the high-average machine production of The American Window Glass Company deserves much of the credit. With every step in the manufacturing processes under perfect control, a high degree of uniformity in quality, thickness and strength is now absolutely assured.

High Standards of Grading

First, second and third quality are relative terms. With high average quality of production, our standards of grading are correspondingly high, in fact the highest standards used in the United States. American Window Glass Company seconds ("A" quality) are suitable for high class residence and public building glazing. Our thirds ("B" quality) are as good or better than many seconds.

Branded Grade Marking

High grading standards invite substitution. Look for the branded American Window Glass Company trade mark on every box of single or double strength glass to see that the branded grade marking has not been altered.

See Sweet's Architectural Catalogue for details of our grading standards.

A Thousand Things You Ought to Know

EVERY day in your work you get up against new problems—sometimes it is only some old "sticker" coming in a new way. Just the same though it takes a lot of time to figure them out. DON'T DO IT. Here's everything worked out for you. Every problem, big or little, that you will meet in a day's work. Hundreds of new ideas and better ways of doing things. Hundreds of ways the other fellows are making money. Hundreds of ways you can make more out of the same work you are doing now.

Cyclopedia of

Carpentry and Contracting

Five great big volumes bound in genuine American Morocco with 2138 pages and more than 1000 blueprints, plans, pictures and diagrams. It is the newest, most complete, most practical work of its kind ever published. Twenty-five well-known experts prepared these great books, gathering the material from hundreds of different sources. Every man in the shop and on the job should have them.

The old days of hit-or-miss experience are passed. You have got TO KNOW if you want to keep in the running now. A little of your spare time and the Cyclopedia of Carpentry and Contracting will put you 'way ahead of the rest. See our FREE trial offer and easy payment plan below.

FREE Examination

8 Months to Pay

Send the coupon for these great Carpentry and Contracting books TODAY. You can't afford to be without them and you don't take any risk at all. The coupon brings the whole set by express collect for a week's free examination. Use the books a week and notify us to get them back if they don't please you. If you like them send us only $2.80 in 7 days and $3.00 each month until $24.80 is paid If you prefer to pay cash with order send only $22.30. The return privilege holds good just the same. Send the coupon NOW and get the consulting membership free. This part of the offer will be withdrawn when the membership is filled. Remember—sending for the books does not obligate you to buy.

Consult Our Experts

With every set of these books we give free a one-year consulting membership in our society. This entitles you to consult our engineers and experts on any building proposition, any time for one year. Write often—ask as many questions as you like.

1,142,433

new homes needed in 1922

Visualize if you can the immensity of this undertaking. 1,142,433 new homes in 1922. Authorities estimate that cities over 25,000 are going to spend $2,025,-501,000—cities under 25,000, $3,352,-588,000. Thus the smaller communities require 72% of the houses needed. No matter how small your town, business will be good.

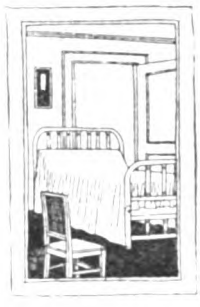
Are You Going to Get Your Share of This Business?

Or by inaction are you going to permit the other fellow to get it? If you want your share of the business that must come—there is no *surer* way to get it than by tying up with Rocbond. There is a place in our organization for representative dealers in unoccupied territory. Write us today. This puts you under no obligation.

ROCBOND

EXTERIOR WALLCO

Rocbond is a 12 months' building proposition — it works as well in winter as in summer. Rocbond represents 18 different stone combinations ready to ship on order.



Rocbond recognizes no structural limitations, as it can be applied over practically all building bases with equally good results. Thousands of Rocbond jobs in 26 states bear witness to the structural goodness of Rocbond.

Dealers and contractors in unoccupied territory are invited to write for complete information about **Rocbond** and Rocbond SERVICE.

THE ROCBOND COMPANY

523 Home Guard Bldg. Van Wert, Ohio
Van Wert, Ohio —Plants— Cedar Rapids, Ia.

Another Room Without the Cost of Building It!

THAT'S just what is being done in thousands of homes and apartments today. Here's an interesting example. See the above photograph—it shows part of a group of 68 two-family apartments being erected by Mills & Sons, Chicago. Each apartment on the second floor has been increased from five to six rooms. How? By installing the Murphy In-A-Dor Bed! But the cost of this additional room has been saved—and think of the tremendous saving in heating, furnishing, lighting, decorating, and household drudgery.

The MURPHY IN-A-DOR BED

The Murphy In-A-Dor Bed is a sanitary—comfortable—all metal—a "regular" bed (full size or twin) pivoted to the jamb and threshold of a standard closet door. The simple mechanism enables it to swing through the doorway—and to be lowered into place with utmost ease. This bed is perfectly balanced—it cannot close up accidentally. The bed clothing is kept in place in any position.

We have a complete technical service department which is co-operating with architects and builders. We will help you with your floor plan scheme. No charge or obligation whatever. We will be glad to furnish you with specifications and detailed information. (Write for illustrated and descriptive folder on the Murphy Ironing Board and Cabinet.)

There is only one "In-A-Dor" Bed—

Use of Clinton Mortar Color in Detroit

A Quicker Sale at a Higher Price

CLINTON Mortar Colors improve the appearance of brick work to such an extent that the property sells more quickly, and at a higher price. Some builders estimate that every dollar invested in Clinton Mortar Colors adds five dollars to the selling value.

Full particulars upon request. Write for names of nearby dealers. CLINTON METALLIC PAINT COMPANY, Clinton, N. Y.

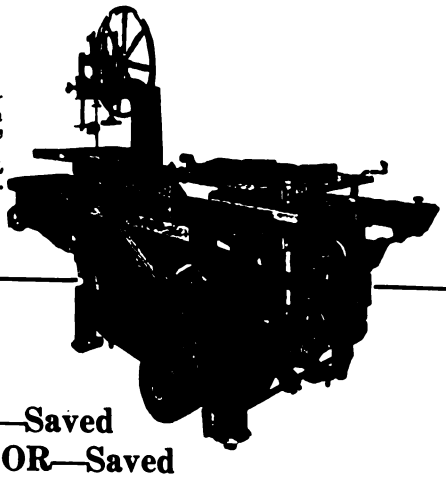
Clinton Mortar Colors

Nature's Mineral Colors. Made Since 1887.

A True Mark of Thoughtful Planning

Foremost among those unseen details of construction that give to the homes planned and built by some contractors added comfort and convenience, is the Kernerator—the modern system for disposing of household waste.

The Kernerator consists of a brick incinerator, built into the base of the chimney when the house is erected, and a hopper door located in the flue on the first floor. It takes care of all household refuse — rags, sweepings, wilted flowers, broken crockery, tin cans, garbage—**without cost,** for no commercial fuel is required.



For complete information see page 1906 Sweet's 1921 Catalog

Kerner Incinerator Company

1627 Chestnut Street Milwaukee, Wis.

SIDNEY UNIVERSAL WOODWORKER

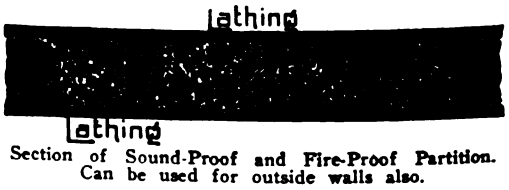
Builders and contractors in every section of the country are using Sidney Famous 31 because of its proven efficiency, dependability, versatility and economy.

Write today for prices, pictures and particulars of this popular machine.

SIDNEY MACHINE TOOL CO.
SIDNEY, OHIO

Section of Outside Wall of House, Showing Wool Between Studding.

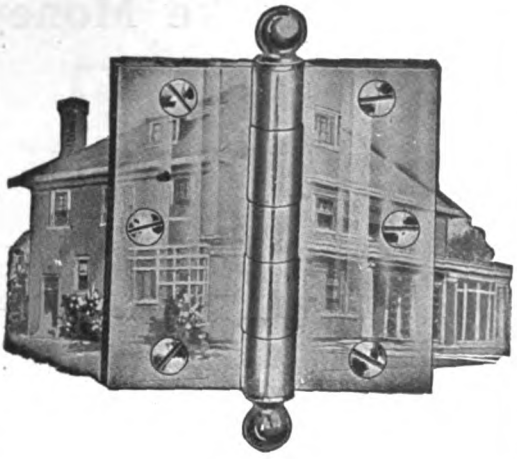
Mineral Wool for Building



Mineral Wool has superseded all other materials used for similar building purposes because it does "a great work at little expense." A house lined with Mineral Wool has an indestructible, fireproof and vermin-proof guard; it protects the entire household. In the winter time it keeps the cold air out, facilitating proper heating and economy in fuel. In the summer it keeps the heat out.

This material, being of fibrous, inelastic composition, acts as a deadener and muffles all sound. It is considered the best insulator material on the market, making it a perfect refrigerating machine.

Mineral Wool makes life-long friends of all its users. If you are skeptical as to its power, let us demonstrate. We can prove all claims. Write us to-day.



U. S. Mineral Wool Co.

280 Madison Avenue, New York
[Cor. 40th Street]

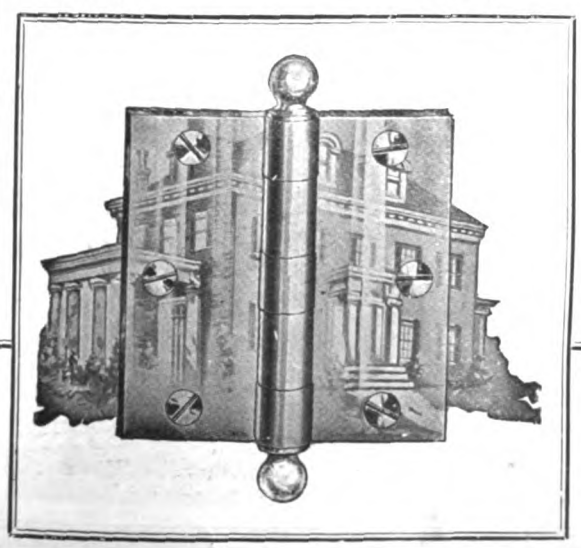
Your
ATTENTION!!

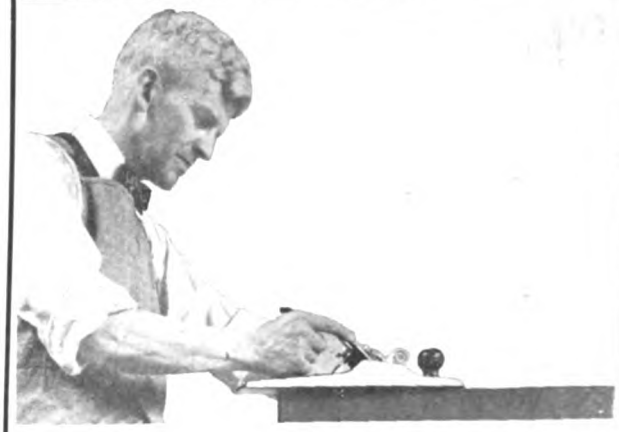
is called to the hinges on the door. To some people door hinges may seem rather small and unimportant—nevertheless, their mission in helping to make or mar the appearance of the rooms in a modern home is worthy of serious thought. The

GRIFFIN
"The Door Butt of America"

is designed along lines that insure both beauty to the home and *service* whenever the doors are opened and closed.



The Griffin operates freely and easily, it is amply strong for heavy doors and it is such a pleasing fixture that architects and home builders are glad to specify and use it.



Being finished in the various Griffin hardware finishes, it is in wide demand for the better class of houses and office buildings.

Chicago

Sargent Auto-Set Planes

When once set, the blade of this plane may be removed for sharpening and replaced in exactly the same position, without re-adjustment.

It has a thin cutter, but the support for the cutter is so solid above and below the clamp that there is no tendency to chatter. The thin cutter has the advantage of quicker grinding.

Sargent Auto-Set Planes are intended for both heavy and very fine cuts—with or against the grain. Being "Sargent Made" they are fully guaranteed.

Send for the Sargent Book of Planes containing full descriptions of the Auto-Set and other Sargent Planes.

Sargent Framing Squares

Another Sargent Product that is a standard among fine workmen.

With Sargent Framing Squares there is no need to work out the lengths of hip, valley, jack and common rafters. The necessary tables are all on the square. Simply measure and read.

The Sargent Steel Square booklet gives full particulars of this and other Sargent Squares. Send for it today.

ONE MAN CAN RUN IT

The Little Whirlwind Concrete Mixer

THE MASTER MIXER

From Factory to You—Save 40%

Only *real practical* small mixer producing same *perfect* work as most expensive big machine. Complete with hand and power drive. A *winner* for the contractor or cement worker. *All steel and iron.* Just like the big $500 mixers, only simpler. Just the size you need at a price you'd like to pay. Does your work in one-fifth time.

The Whirlwind Way Makes Mixing Pay

Saves its cost on one job. Capacity about 2 cubic ft. Mixes a batch a minute. Does PERFECT work, wet or dry, empties clean. Discharges direct to forms, cuts out the wheeling and backache. Satisfaction guaranteed or your MONEY BACK. References. Any La Crosse bank or Dun Agency. Write for circular or order direct from this adv. and avoid delays.

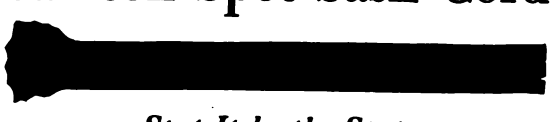
Only $64.50

The Little Whirlwind Mixer Co.

438 Gould Street La Crosse, Wisconsin

8 MEN CAN'T STICK IT

Improved Boring Machine



This machine is from new design, and no pains have been spared to make it a first-class machine in every respect. The spindle is made of crucible steel, has No. 2 Morse taper hole to receive shank, and the bearings are of genuine babbitt metal. It has two stops to regulate the travel of the spindle, one in the head to adjust the downward stroke and one in the treadle for the upward stroke. Greatest length of travel of spindle is 6½ inches. Distance from center of spindle to column, 10". Table is 26" x 36". It is balanced and has a vertical movement of 21". Spindle is balanced by a coil spring attached to arm on top of frame, making it self-contained. The bracket that carries the driving pulleys has an adjustment of two inches, which is very desirable. T & L pulleys are 8" x 3" face, and should make about 800 revolutions per minute. If belt gets loose, loosen screws in front of bracket and by turning set screw on top till your belt is of the right tension.

This home is Long-Bell Plan No. 1216.

The home pictured above is Long-Bell Plan No. 391.

DO YOU WANT TO KNOW WHAT A HOME LIKE ONE OF THESE WILL COST ALL COMPLETE?

Tear out this page and take it to any retail lumber dealer. Ask him to show you the Long-Bell Plan Service. You will find these two charming small homes and their floor plans there, along with 56 others equally interesting.

Choose the style you like best and the size to fit your needs, and then ask the lumberman to give you an estimate of the cost complete. The low figure will surprise you, for Long-Bell home plans are designed to provide good looking, well arranged small homes at low cost.

Most lumbermen keep on hand Long-Bell plans. If yours hasn't them, write us.

For beauty, for permanence and for the sake of the investment, build of good materials. Build with wood, the least expensive material you can buy today. To be assured of obtaining lumber of **uniform high quality** ask for lumber bearing the Long-Bell brand.

We will send free to contractors, builders and Architects a copy of our book "From Tree to Trade," the story of lumber from the woods to the finished product. Please mention this publication.

CON-SER-TEX

CANVAS ROOFING
THE IDEAL ROOFING

FOR Porch Floors, Sun Parlors, Sleeping Balconies, and all flat surfaces.

Wherever a durable flashing or a lining for a wood box gutter is required—

Wherever an economical, durable, attractive covering is needed—

Con-ser-tex Canvas Roofing will give satisfaction. It's a chemically treated heavy cotton fabric which will not crack, stretch, shrink, curl or peel. It's easy to lay and profitable.

Our Free Booklet, "Roofing Facts and Figures," illustrates and explains the many uses and advantages of Con-ser-tex.

Write for These Books

They are helping contractors and builders in every locality to obtain more building work through the many attractive house plans presented. They are full of authoritative information essential to the success and profits of your business.

The Story of Brick:

A sixty-page, complete presentation of Face Brick as a construction material, its history, its possibilities and advantages. It describes brick bonds and patterns, methods of financing homes, and gives authentic cost comparisons. Beautifully illustrated. A sales manual containing all Face Brick sales features for contractors to explain to prospective builders. Will be sent free.

Manual of Face Brick Construction:

An every day reference book for the practical builder, replete with detail drawings and explanations of the best methods of handling the three kinds of walls — face brick with common brick, face brick with hollow tile backing, and face brick veneer on wood studs — and all phases of Face Brick construction. Supplemented with thirty designs for which plans are available at small cost. Price $1.

The Home of Beauty:

A handsome book of practical and artistic home designs. Shows perspectives and floor plans for fifty designs by skillful, experienced architects submitted in a nation-wide prize competition. Wide variations in the designs help you to please many prospective builders. Plans embody many unusual conveniences. Complete working drawings of every design available at nominal prices. Price 50c.

Bungalow and Small House Plans:

An exceptionally fine collection of designs for homes of from 3- and 4-, to 7- and 8-rooms has been embodied in this series of four booklets, each booklet being devoted to houses of a particular size. Unique presentation of designs gives a choice of two exteriors for each floor plan. Plans in reverse may be secured for each design. Nearly 200 arrangements shown. Single booklets 25c; set of four booklets, $1.

This valuable building information and the unequalled but inexpensive plan service offered in these books is of vital necessity to every builder. Send for them, addressing Department B. 3.

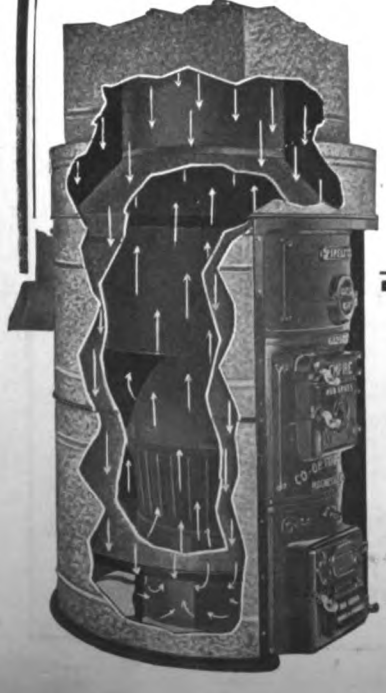
38 ROOMS!



This residence has about 38 rooms, is 3 stories high, except the front, being a T-shaped building, having 10 bathrooms alone and an extraordinary glass exposure.

A completely equipped hot water system failed to heat satisfactorily and 3 medium sized Red Cross Empire Pipeless Furnaces were installed. The result was perfect heat distribution and another distinct achievement for the

Red Cross Empire

PIPELESS SYSTEM

The furnace with a reputation

Years of experience are back of this splendid furnace and every piece or section is just the proper size and weight.

It is built to give a lifetime of satisfactory service, economically and efficiently.

You are guaranteed 70 degrees of heat in every room in zero weather and with less fuel consumed than by any other system.

Investigate and be convinced! We have dealers in every locality and will be pleased to send you circulars, etc., describing the Red Cross Empire Pipeless upon request.

Ambler Asbestos Building Products

They give strength and permanence with attractiveness. They make tight, comfortable building that saves in painting and insurance.

You can't burn AMBLER ASBESTOS BUILDING PRODUCTS because they are composed of "unburnable" materials—long-fibre asbestos and Portland cement—rolled out with pressure of 3,000 lbs. to the square foot into convenient sizes and lengths for both interior and exterior work. Permanent colors made in the body of the material. No warping or cracking. Can be worked with ordinary tools.

Investigate Ambler Linabestos Wallboard for every interior lining use—partitions, wainscoting, hallways, libraries and game rooms, attics, bathrooms, kitchens, etc. Attractive buff color. Made 48 x 48, and 48 x 96, to fit standard joists.

For exterior use—half-timbering, paneling, fire doors, trim—and for interior use where unusual strength is required, call for Ambler Asbestos Building Lumber.

For a snug-fitting, attractive, thoroughly fireproof roof, use Ambler Asbestos Shingles in the American, French, or Honeycomb style.

You may have full information and specimens without obligating yourself.

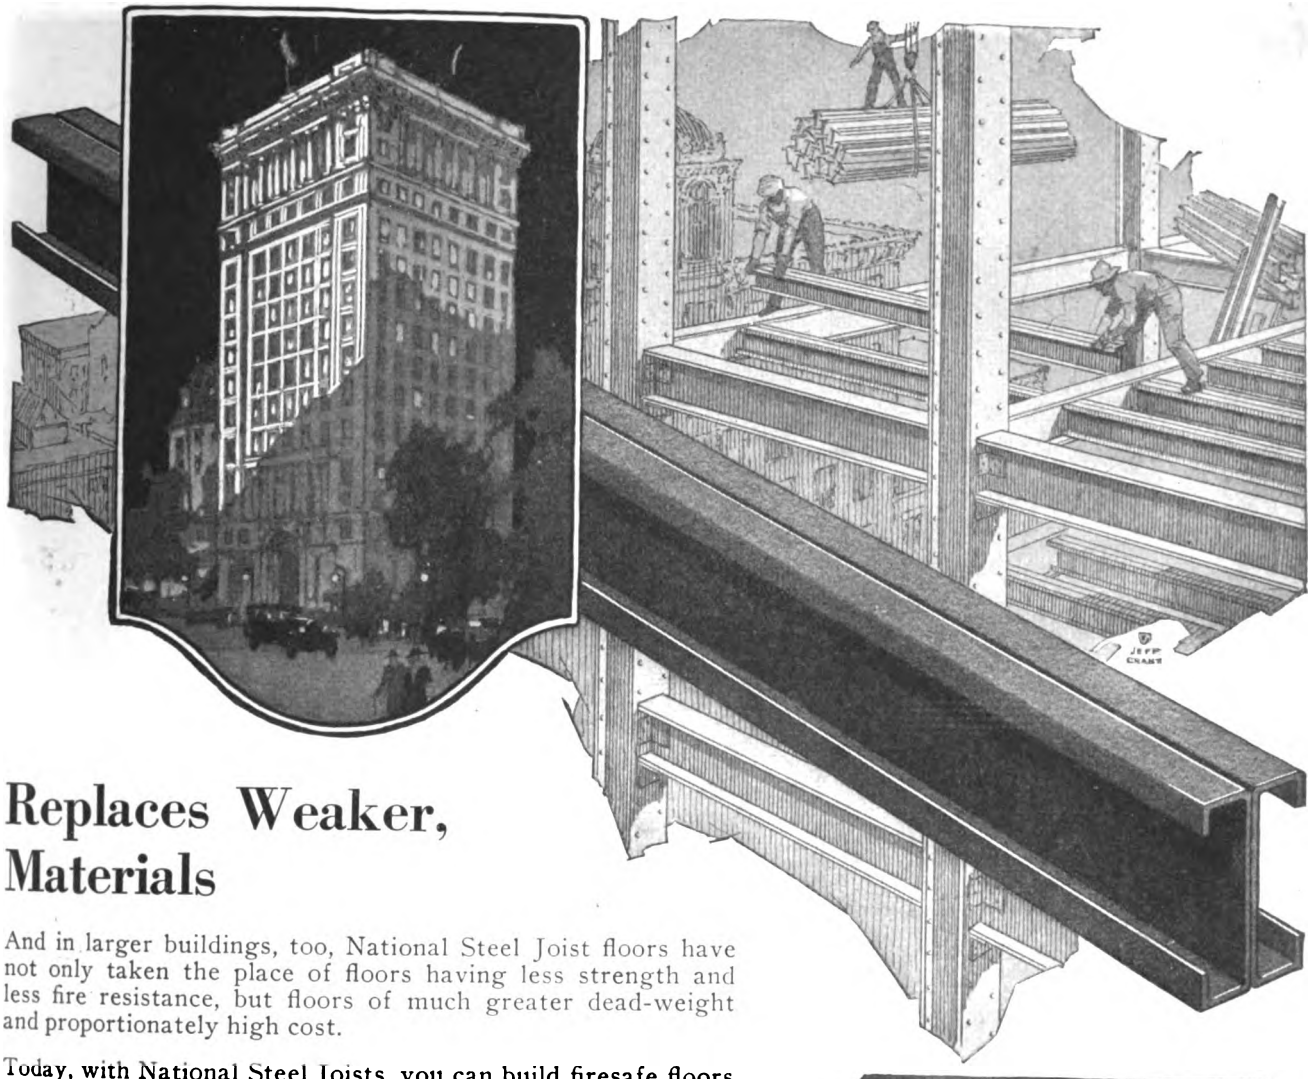
Steel Again Combustible

YOU have heard about the Firesafe First Floor for residences which is built with National Steel Joists. It is the biggest idea in dwelling construction in years. It is **Steel** stepping forward again to take the place of a weaker and combustible material.

Most dwelling fires start in basements. The Firesafe First Floor built with National Steel Joists, as shown in the detail sketch at the left, will cut off those basement fire hazards from the livable sections of the home. Such a structural floor can have any kind of surface. It cannot warp or sag. It is dust-proof and vermin-proof.

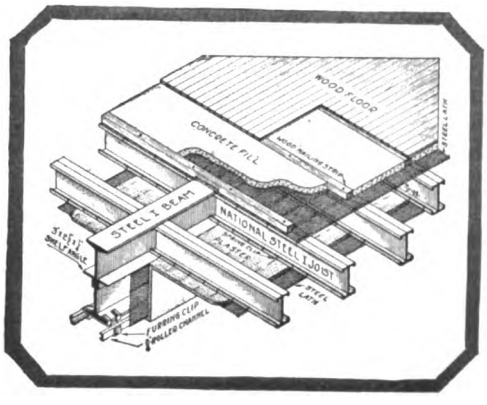
The cost is very little more than that of wood joists and wood sub-floor. We want you to know just how the cost figures. Send us a pencil sketch of the basement plan for one of the homes you intend to build. We will return you a National Steel Joist layout, bill of materials and exact cost.



ISOMETRIC DRAWING
Showing steel lumber floor construction.

THE NATIONAL PRESSED STEEL COMPANY

NAT STEEL



Digitized by Google

Replaces Weaker, Materials

And in larger buildings, too, National Steel Joist floors have not only taken the place of floors having less strength and less fire resistance, but floors of much greater dead-weight and proportionately high cost.

Today, with National Steel Joists, you can build firesafe floors having practically half the dead-weight of any other type of recognized fireproof construction. You save money on footings, columns, weight of material to buy, handle, erect and on which freight must be paid. You have no falsework to build and tear down. No special scaffolding. No delays whatever. You have a strong, durable floor of great fire resistance at lowest cost, easily and quickly erected, light in weight and sound proof. See detail sketch at right.

National Steel Joists and also National Metal Lath are carried in stock in leading cities. Delivery is made promptly. The Joists come to the job all cut to meet plans. Write for further details. Bungalow or skyscraper, let us help you plan and figure on National Steel Joist floor design.

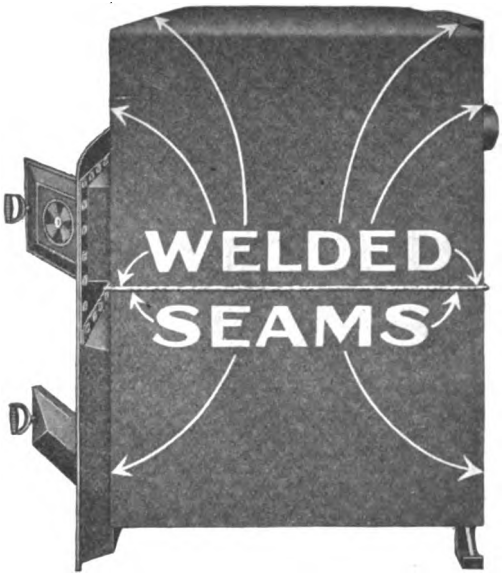
WHAT'S YOUR CHOICE?

Would You Buy a Cracked Furnace?
HERE'S ONE

Rough castings—piled one on the other. No fitting, but the cracks filled with cement or sand. They warp and twist—expand and contract with heat, distributing gas and dust all over the house. Limited radiating surfaces, unevenly heated; wasteful of fuel; expensive to repair.

THE ORDINARY FURNACE



Not from any particular maker, but a **type** produced, with slight modifications, by many foundries. Just the common, ordinary, cast iron furnace, which established the reputation that furnaces are dusty and dirty, and **"lives up to it."**

The Hess Furnace Is DIFFERENT

A solid steel box—with every seam riveted and welded; sealed with melted steel. As tight as a bottle. Firebox, ashpit and grates inside. **Seams guaranteed never to leak as long as the furnace lasts.**

COSTS MORE (but not much more) **WORTH MORE**

Burns Anything. Delivers All the Heat

THE HESS WELDED STEEL FURNACE

Immense radiating surface, evenly heated, but never over-heated, the firebox being lined with heavy fire brick.

Six sizes—**Pipe** and **Pipeless.** Ask for our illustrated booklet telling how we heat houses successfully, assuming full responsibility for success, no matter where you live.

The Speed Marvel

It does such an abundance of work so economically it has been the means by which hundreds of contractors have saved money

Hutchinson Lightning Woodworker

This machine, buzzing away on your jobs, turns out as much cut lumber in an hour as two men do in a day. It is a complete portable planing mill. It is not just a "saw table." It is a swing saw. It is a parallel saw. It is a big, sturdy miter box that will cut and dado at any angle. It cross cuts, rips, planes, miters, joins, bores, rabbets, grooves, sands and grinds.

While doing this versatile work it is turning time into money and saved man power. You pay for the Speed Marvel whether you buy it or not. You will be interested to know about its accomplishments for others and how it will cut costs and prove a wonderful investment for you.

This ad—February 25—starts a new series of powerful Beaver Board pages in the Saturday Evening Post. You know what that means! New, profitable Beaver Board jobs for live contractors and carpenters.

Why live with cracked walls and ceilings?

Fix them up today. Simply nail big Beaver Board panels right over the old plaster. Paint the surface, apply the decorative wood strips, and at small cost convert old rooms into attractive new interiors. There's no muss or litter, no delay. Beaver Boarding is quick, clean work that can be done in any kind of weather.

Beaver Board is not only easy to apply but the result is permanent. The big panels are real manufactured lumber, built up from the long fibres of Northern spruce. Each panel is thoroughly sealed and sized by our exclusive patented *Sealtite* process. Beaver Board walls and ceilings can never crack or fall.

Ask your local carpenter or building material dealer to tell you more about Beaver Board. Or make a rough sketch of your old rooms, giving dimensions, location of doors and windows, and the type of room, and mail it to our Builders' Service Department at Buffalo. Our expert designers will prepare finished plans and send you photographs of similar Beaver Board interiors, all without charge or obligation.

Genuine Beaver Board is handled by lumber and building material dealers everywhere. Ask the one nearest you for sample and a copy of our booklet "Beaver Board and Its Uses."

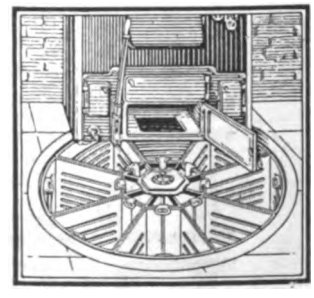
The Cellar As It Should Be

Economy in home space necessitates the cellar being planned as a clean, simple useful part of the home. A cellar cannot be attractive and useful if ashes, ash dust and ash cans are in evidence.

The Sharp Rotary Ash Receiver is the only practical and nationally used device that solves the problem of ashes and ash disposal.

It is easily installed in connection with any size or style heater. It stores out of sight beneath the floor the ashes that usually stand in unsightly cans beside the heater.



No stooping over, no shoveling, no dust to get on your clothes or to breathe in when you have a Sharp Rotary Ash Receiver with your heater. The cellar is a different and real attractive part of the home as made clean by this practical convenience.

Dealers, Builders or Agents desiring to sell this latest home convenience write today for particulars about your territory. Selling connections rapidly being made everywhere.

Send for descriptive catalog.

SHEETROCK

Sheetrock is put up by the same men who erect the framing

No builder can afford to overlook the advantages of Sheetrock in remodeling work or in new, moderate-priced construction.

Sheetrock is gypsum plaster factory-cast in broad, rigid, ceiling-high sheets ready for nailing directly to the joists or studs.

Sheetrock Is Easily Fitted

Sheetrock saws and nails like lumber, is easily and quickly erected, and gives snug, flush joints.

Sheetrock will not buckle or warp or pull away from the nail heads. It is put up by the same carpenters who erect the framework; goes up in any weather.

It Will Not Burn

Because Sheetrock is made from rock and protects against fire it appeals strongly to home owners.

Remember, too, that Sheetrock is not affected by weather extremes or by moisture. It is vermin-proof and it is permanent.

Sheetrock Can Be Papered

With Sheetrock Finisher applied at the joint seams a perfectly flat, smooth surface is assured. Sheetrock walls and ceilings take any decoration the owner wants—paper, paint or panels.

Let us send you our plan for getting Sheetrock jobs. It may mean increased profits for you. Mail the coupon today!

Sheetrock is inspected and approved by The Underwriters' Laboratories, Inc.

Will Your Shingles Stand This?

Thursday, October 20, 1921, at the Daigle Iron Works, Detroit, Michigan, the following test was made with a Winthrop Tapered Asphalt Shingle Roof. A section, laid according to standard directions and so constructed that one roof board could be withdrawn for observation of the effect of the test, was equipped with a shelf to support a blow torch in such a way that the flame of the torch would be directed against the shingles. The nozzle of the torch was six inches away from the shingles, the point at which the heat is most intense.

This picture shows the test after the torch had been burning for 5 minutes.

The test was continued for 45 minutes. After the torch was extinguished, this picture was taken. The asphalt surface, at the spot where the flame struck the shingles, was somewhat melted and some of the asphalt had run, but the shingles were not burned through. The roof board was withdrawn. Small spot visible on the board was not burned nor even charred, it is merely a stain from the asphalt that softened on the underside of the shingles.

Winthrop Tapered Asphalt Shingles give practical protection from the most dangerous fires of all, roof fires. Winthrops are fire-safe, long-lasting and add distinction to the building.

Learn about these wonderful big butt shingles. They are the only asphalt shingles that are tapered. The taper gives weight where weight is needed and it adds to the beauty of the roof.

Write for full information and sample shingles. Address the nearest factory.

Windows Run Smoothly in Andersen Frames

SATISFACTORY performance over a long period of time is the one test of a good window frame. Every step in the manufacture of the Andersen Standard Window Frame builds into it satisfactory long-lived performance.

The use of genuine White Pine in Andersen Frames is one method of securing snug fitting, easy running windows. Because of its ability to withstand warping, shrinking, swelling and rotting, White Pine is recognized by builders as the best wood for all out-of-door uses.

Each part of an Andersen Standard Frame is the product of a special machine, set so that the finished piece will fit accurately the part for which it is intended. That's why Andersen Frames fit perfectly when assembled. The White Pine stock used keeps them accurate for all time.

From a stock of only 11 standard sizes the dealer can deliver immediately 121 different sizes of Andersen Window Frames, simply by inter-changing heights and widths. Each frame, complete with pockets and pulleys in place, is packed in two compact bundles containing seven units. These seven units can be nailed up in 10 minutes, or less.

Write for This Book—We have prepared an interesting book on the qualities and economies of Andersen Frames. Upon request, we will gladly send you a copy—no charge.

THE BUILDERS' JOURNAL

NEW YORK, MARCH, 1922

Better Homes at Less Cost

Novel Methods of Design and Construction Devised by Ernest Flagg for the Economical Erection of Artistic Small Houses

TOWERING six hundred forty feet above Broadway, New York, rises the famous Singer Building. The master mind which designed this gigantic building is also the designer of the two small houses, shown on this page. The designing of big buildings is the everyday work of Mr. Ernest Flagg, noted New York architect, still he finds it just as interesting to plan the small house as he feels it constitutes, perhaps, the most important part of new construction at the present time.

Great minds when they work on simple everyday problems, blaze the way for innovations. It is not surprising, therefore, that Mr. Flagg would devise novel methods for erecting small homes—but that he would bother with so small a subject.

It is indeed fortunate for the building industry that there are men like Mr. Flagg who will do pioneer work from altruistic motives only, making innumerable trials at considerable personal financial expense to find out better ways of constructing small buildings and then giving the results of this creative work to the industry at large for its betterment.

The Editor of BUILDING AGE and THE BUILDERS' JOURNAL was informed by a mutual friend of Mr. Flagg's remarkable work, and feeling that this would be something of interest to our readers, he took the matter up with Mr. Flagg, which led to his kind invitation to the editor to visit some of the buildings under construction. These buildings are located at Dongan Hills, Staten Island, New York, and in them Mr. Flagg has actually built and put to use the various labor and cost saving systems that he has devised.

Two Small Houses Designed and Sketched by Mr. Ernest Flagg

Used to the ordinary methods of construction the writer could not but marvel at the amount of thought that Mr. Flagg has given to the small house both in design and construction.

To one of the writer's questions Mr. Flagg replied: "I have set out to change the conventional type of small house and it is the largest contract I ever undertook."

The cry today is for more homes, but the expense for material and la-

Digitized by Google

bor is still beyond the reach of many. Realizing these handicaps, Mr. Flagg set to work to devise some practical methods of construction and design that would reduce cost. The method which he has used makes available space usually wasted or which is of little value. About 30 per cent. of the cubic contents of the ordinary small house is of that character and is mostly in the cellar and slopes of the roofs. The amount of material is thereby cut down, and the method of construction used is such that a large portion of the work can be done by ordinary labor.

In the locality where Mr. Flagg started his experimental houses, an excellent variety of stone was to be had. This was a sort of soap stone which is impervious to moisture, therefore, the inside walls are plastered directly on the stone and have been found moisture proof. The advantage of selecting a stone of this sort is at once apparent and the saving considerable.

For locations where these favorable conditions do not exist, or stone cannot be had, the thought occurred to the editor that the same details of building Mr. Flagg has devised could be applied to brick, hollow tile, or concrete construction just as well, so as to reap the benefit of the large saving in cost.

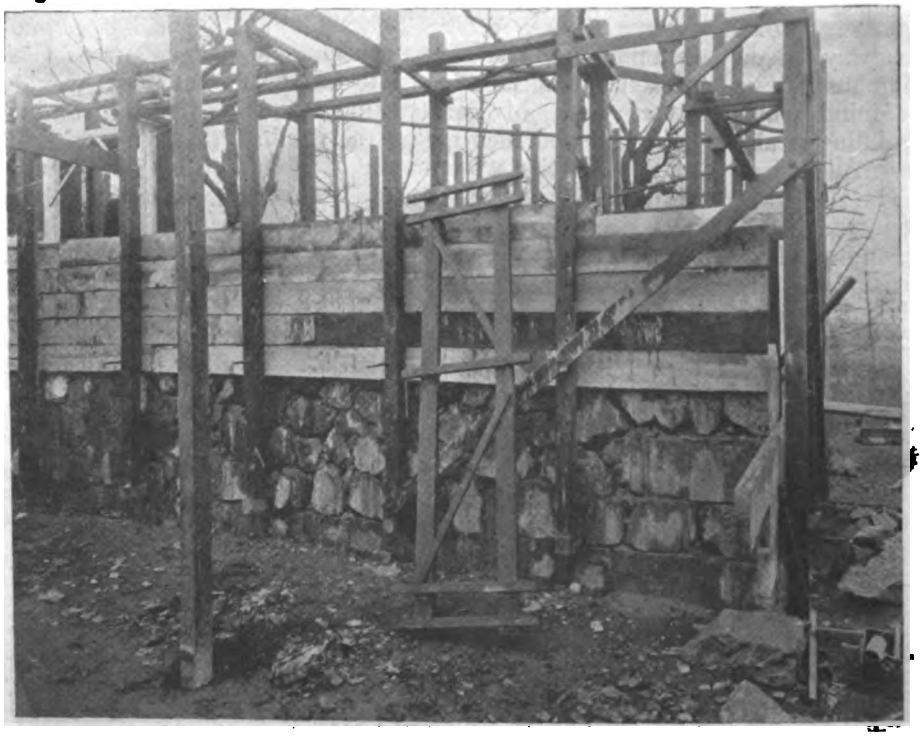
In many of the designs recommended by Mr. Flagg, cellars and attics have been omitted. In the sketch at top of page 19 the low building towards the right is a storage shed that serves the same function as a cellar, with the advantage of being above ground.

"To keep operating cost down," Mr. Flagg said, "impress upon your readers that the item of upkeep should be carefully considered in construction, using materials and devices that will not require constant painting and repairs for their preservation and omitting those which do."

The Mosaic Stone Wall Forms Removed—Lower Part Has Been Pointed

Mr. Flagg then pointed out how outside wood trim was eliminated as much as possible, porch floors are of concrete or brick, outside steps of masonry, etc. Windows are all inward opening casements; copper screening is fastened with copper tacks on the window frame and these are left in place all year—no expense for screen frames and no work taking down and putting up or painting them.

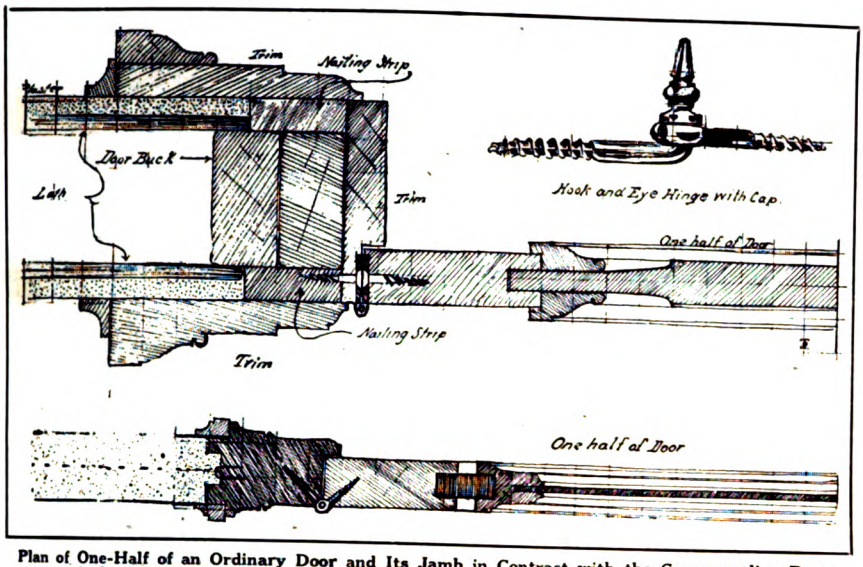
The first floors in the houses are of waterproofed concrete with a wood floor laid on top of this on sleepers. Beam ceilings are used in most rooms, these are real beams that actually hold up the upper floors, and result in saving most of the cost of plaster ceilings and of space wasted in floor thickness.



Until quite recently, wood in this country has been abundant and cheap. It was natural, therefore, that great use should have been made of it. Stone for ordinary houses, except in certain limited areas, has been little used, chiefly because of its supposed great cost. Now wood is daily becoming more expensive and scarce, and the conditions are, therefore, ripe for a change from wood to stone or other incombustible material, but it will doubtless come about slowly.

Both speed and economy in building depend on forethought and system, which, if properly followed, should greatly reduce the cost of building.

Mr. Flagg kindly explained that the theory for the use of stone in these houses is that low walls are much less expensive to build than high ones; it is possible to use forms without the usual waste of lumber which reduces the cost of the stonework.



The theory for the use of wood is: It is more economical to use a better grade of wood and expose the construction, correcting shrinkages, if they occur, than to use poorer stuff for structural members and then go to the expense of covering them up and casing them in. Indeed, under this latter plan, which is the common one, more material is often required for casing than for the structural members themselves.

If the forms are well made and the work of setting them properly

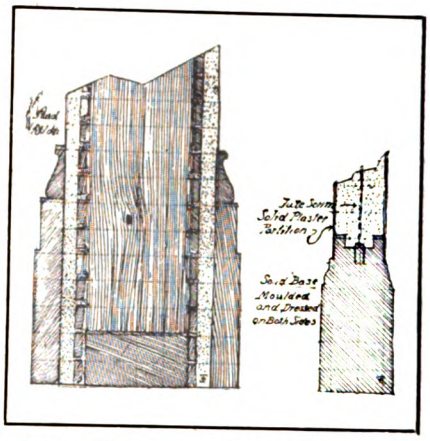
Plan of One-Half of an Ordinary Door and Its Jamb in Contrast with the Corresponding Parts of the Doorway Devised by Mr. Flagg—Both Plans Are to the Same Scale



Plasterers Working Together Against Each Other on Both Sides of Jute Net Support for Plaster Partition

done, this method secures remarkable accuracy, and all parts fit with precision. If all necessary materials are on hand, as they should be before beginning, the work proceeds with a degree of exactness and speed uncommon in ordinary building. As all parts and methods are uniform in each instance, the workmen soon become used to them.

In the construction of stone walls for his experimental houses Mr. Flagg has hit upon a very simple method of obtaining good work from unskilled labor by offering a bonus of $50 for a perfect job, to be divided among the men. For every stone that is unevenly placed, which makes it look badly, $5 is deducted from the $50. Needless to say the method works like a charm, the men take an interest in doing good work as it pays them.

Perhaps the most remarkable feature introduced by Mr. Flagg is the solid plaster partition which is made by simply hanging loosely woven burlap or jute net, tacking it in place and plastering on it, working both sides at once and making a solid plaster partition about 1-3/4 inches thick! This looked rather weak to the writer and he expressed just a little doubt about it. Mr. Flagg smilingly suggested to test it, which was done rather vigorously, and the writer was then convinced of its desirability for all non-bearing partitions. This method not only saves the cost of studs, sills, plates and lath, but also the labor of their erection, and permits of several other economies, an important one being the elimination of most of the ordinary trim or casing.

The usual way of making a doorway is to construct a frame around the opening, called a door-buck, and after the plastering is finished cover the buck with a casing. The true frame is thus covered up, and the archi-

Section Through an Ordinary Lath and Plastered Partition Contrasted with a Corresponding Section of the Solid Plaster Partition and Base—Both Sections Are the Same Size

Four Different Stages in the Construction of the Plaster Partition on Jute Net Support

Digitized by Google

trave which one sees about the doorway is a sham.

These partitions cost considerably less than ordinary ones, but this is by no means the real measure of their economy. Floor area in almost any kind of house costs at least $6.00 per square foot. Six-inch partitions occupy one-half square foot of area for each running foot, that is to say, space which costs an owner at least $3.00 to obtain. These thin partitions occupy one-third as much, and the saving is proportional.

The hanging of a door under ordinary circumstances is quite an operation, and consumes a great deal of time, for each opening, being cased in with its sham architrave, is bound to differ somewhat from the others, and each door must be separately adjusted. If made as here described no such adjustment is necessary. The frames are put together in the shop of a size to correspond with the doors and all hardware applied. If frames are set plumb nothing remains to be done to them at the building but to place the doors on their hinges. By this means a vast amount of useless material and labor is saved, a great deal of time gained, and better results secured.

With the thin partitions and narrow door-jambs it is very convenient to use doors which have a rabbet instead of on the jamb.

When rabbeted doors are used the door-frames need be no thicker than the plaster partitions, i. e., 1-3/4", as shown in the illustrations, but if the rabbet is on the jamb, it is more convenient to use slightly thicker stuff, as shown in the other figure. When that is done, eyelet hinges may be used or hook-and-eye hinges, as illustrated, but such hinges are no good unless properly set.

It is not only in doorways and bases that useless materials are dispensed with, as the same methods apply to windows and all other places where building window-boxes after the usual fashion, the frame itself is casing is commonly used. Instead of moulded to adjust it to the sash, and all casing about it, whether inside or outside, dispensed with.

By this means most of the ordinary woodwork trimming of the house is omitted and the cost of all that material saved, also the cost of its installation, painting, and upkeep; besides which a great amount of inflammable matter is excluded from the building, lessening the fire risk.

This Roof Is Just Plain Rubberoid Roofing, Laid in Horizontal Strips—The Shingle Effect Is Simply Obtained by Use of Metal Clips

Some of the details of construction that Mr. Flagg has devised are described in an interesting book, particulars of which can be obtained from A. W. Hendrickson, 111 East 40th Street, New York.

One point that Mr. Flagg impressed upon the writer was that it is not "what a thing costs but what you get for your money," and he has made some practical applications of this axiom. The roofs of his buildings are covered with the cheapest grade of prepared roofing. Still, they have an artistic appearance. The common method has been to use this roll roofing in long strips, cementing the edges and making the finish at eaves by bending it over and tacking in place with some beautiful (?) tin washers, the whole effect being cheap.

Mr. Flagg has taken this same material, cut it into strips nine inches wide, laid these horizontally with a lap of two inches, and the edges at eaves are covered with thin sheet lead which makes a neat finish, as it is firmly held in place by a few copper nails. This makes an absolutely permanent and substantial finish. The strips of roofing are not cemented down as is ordinarily done, but little clips are used and spaced about six inches apart. Before these are bent over they form a guide on which to hold the next strip, therefore, the strips of roofing can be laid very quickly. As soon as a strip is in position the clips are turned down; this holding the roofing in position.

After a time the natural material in this composition roofing will cement itself together. The clips used are made of galvanized iron, which in time rust out and rain washing down on the roof produces a streaked effect not unlike shingles. This is very clearly illustrated in the picture shown herewith, but when seen on a roof it has the appearance of a slate roof. Here is a new idea of obtaining good effects by using just common every-day materials.

While the Editor was very enthusiastic at seeing these new methods, Mr. Flagg cautioned that his system of building is intended for repetition and stated "It would hardly pay to adopt it in its entirety for a single house if the matter were to end there. Where the processes and apparatus are used, over and over again, great economy should result; but for a single building, the trouble and expense of introducing so many new or unusual features and methods might offset the benefits which should accrue under more favorable conditions.

"Standardization both of the parts and workmanship plays a great part in the economies obtained and standardization implies quantity."

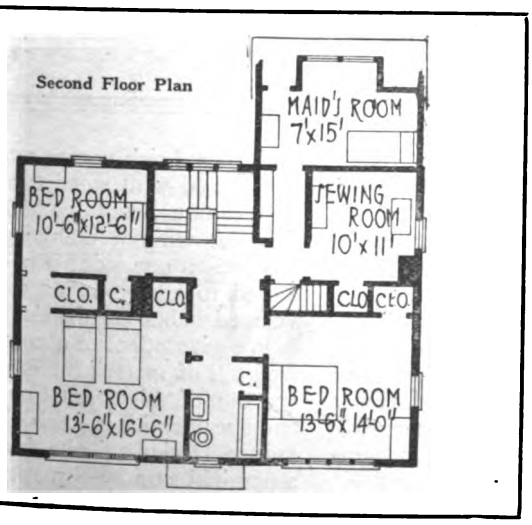
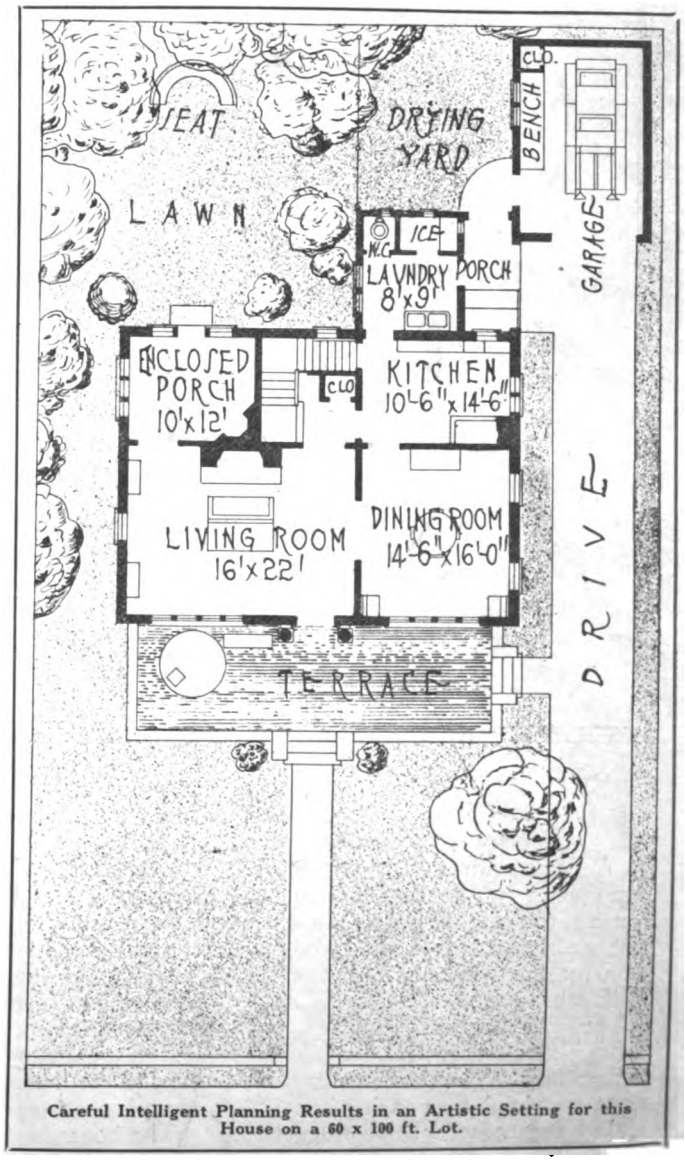
Brick and Stucco Home

Simple and Artistic Design



BEAUTY can be secured by handling the ordinary materials of building construction effectively and a very interesting example of this is shown in the artistic little house shown here.



It is free from superfluous ornamentation and possesses a charming dignity that is unusual in just a plain rectangular gable end house without dormers.

As shown on the plot diagram given with the first floor plan the house is placed almost in the center of a sixty by one hundred foot plot and from all points presents a picture. Its charm is due to proper setting.

The view is not all from the outside, as particular attention has been given to securing a pleasing vista from the interior. From the enclosed rear porch one looks out on a tree and shrubbery enclosed garden, the drying yard is separated from it by an ornamental lattice fence that serves as a good background for flowers.

This house was built for Mr. Allan Reed at Wyncote, Pa., from plans prepared by De Armond, Ashmead & Bickley, architects, of Philadelphia.

Careful Intelligent Planning Results in an Artistic Setting for this House on a 60 x 100 ft. Lot.

Two Family House Design

Interesting Practical Plan With Six Convenient Rooms to Each Apartment Specially Designed for Readers of Building Age and The Builders Journal

By R. C. HUNTER & BRO., Architects, New York

THE three bedrooms to each apartment give accommodations for a rather large family. A single main entrance serves both apartments while the service entrances are each entirely separate. The main vestibule is the only common meeting place of both families. This privacy is to be desired.

The plan arrangement of both floors is almost identical, the kitchens, bathrooms, etc., and all main partitions are plumb over each other. This makes for economy in construction. There are separate side entrances which serve to reach kitchen as well as cellar.

The small private hall serves the bedrooms, the dining room and the kitchen in a convenient manner.

The living rooms extend across the front of the house and open into a pleasant sun room. These sun rooms are arranged in a bay that forms a feature of the exterior and that gives light to the living room. Each living room has an open fireplace.

The house is designed along Colonial lines, brick veneer and stucco on frame and with wood trim.

This house could be built on a fifty foot lot without cramping and with a drive on one side; it is a type well suited to a city lot or a closely developed suburban district.

We give opposite a complete itemized bill of materials required for the erection of this house. Complete plans and specifications of this Two-Family House Design will be furnished for a nominal sum by BUILDING AGE and THE BUILDERS JOURNAL.

Quantity Survey of Two Family House

Shown on Preceding Page

THE quantities given are for estimating. All measurements are NET unless otherwise noted; areas given for such items as sheathing, flooring, etc., are net areas to be covered, with no allowance for matching, waste, etc. Minor outs have been disregarded.

Such items as clearing site, temporary work and protection, scaffolding and general equipment and supplies, have not been included.

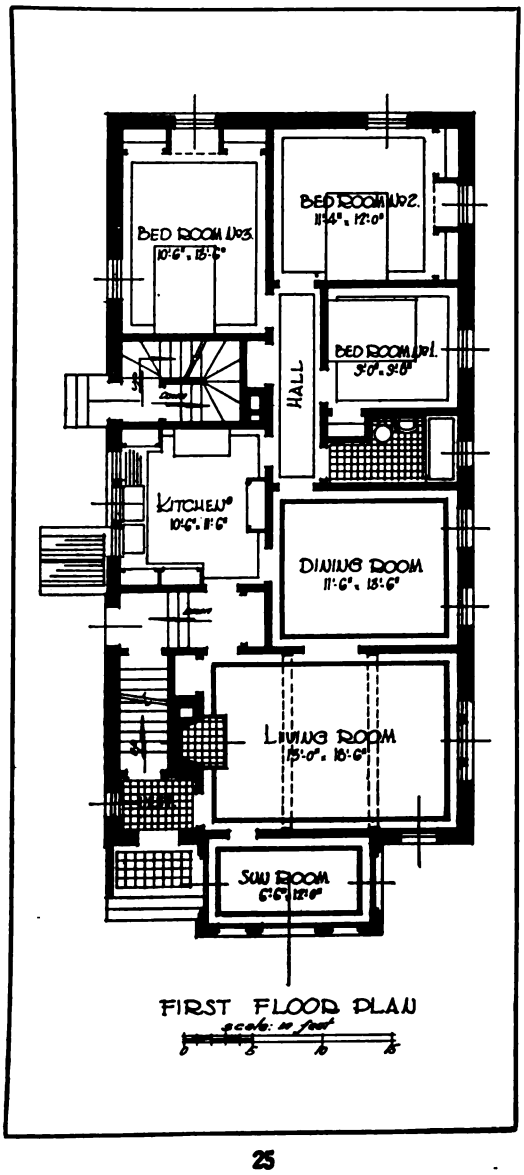
Such items as are marked "Unit," are to be estimated in a lump sum, following requirements of plans and specifications.

Excavation

(Excavation for pipe trenches not included)

Excavation for cellar	388 cu. yds.
Excavation for footings	11 cu. yds.
Excavation for areas	6 cu. yds.
Excavation for trench walls	4 cu. yds.
Backfilling around walls, etc.	58 cu. yds.

Masonry



Concrete work.	
Concrete for cellar walls	1060 cu. ft.
Concrete for footings	438 cu. ft.
Concrete for trench walls	69 cu. ft.
Concrete for area walls	65 cu. ft.
Cellar floor (3" concrete and 1" cement finish)	1327 sq. ft.
Outside cellar steps (concrete, cement faced)	40 sq. ft.
Outside granolithic steps, etc. (4" conc. 1" cem.)	72 sq. ft.
Concrete forms	2700 sq. ft.
Pointing cellar window sills	27 lin. ft.
Finishing concrete foundation above grade	350 sq. ft.

Brick Work

Common brickwork for chimneys (or 4 M.)	190 cu. ft.
Brick veneer for outside walls (or 16 M.)	2200 sq. ft.
Brick for firestopping	4 M ..
Face brick for fireplace hearth and jambs (or 280 brick)	40 sq. ft.
Fire brick for fireplaces (or 250 brick)	50 sq. ft.
8" x 12" T. C. flue lining	94 lin. ft.
3" bluestone chimney caps, 1'6" x 2'6"	1 unit ..
1'10" x 3'0"	1 unit ..

Mason's Iron Work

Steel lintels, 4" x 3" x 5/16" angle, 2/9-2/7-1/4	36 lin. ft.
Wrought iron rail for entrance porch, (4'0" long, 3'0" high)	1 unit ..
Wrought iron rod for marquee, (⅝" dia. with turnbuckle, anchor, eye, etc.)	2 units ..
Fireplace damper (3'0" opg. with throat, etc.)	2 units ..
C. I. ash dumps	1 unit ..
C. I. cleanout door for ash pit, (16" x 12")	1 unit ..
C. I. cleanout doors for flues (8" x 8")	2 units ..
Thimbles for boiler flues	2 units ..

⅞" x 4" skirt board	190 lin. ft.
1⅛" x 8" coping	160 lin. ft.
⅞" x 6" apron	160 lin. ft.

Pilasters, etc., sun room extension:

1½" x 11" pilaster	84 lin. ft.
¾" x 8¼" pilaster	28 lin. ft.
¾" x 6" pilaster	84 lin. ft.
⅞" x 4" fascia	28 lin. ft.
⅞" x 12" frieze	16 lin. ft.
⅝" x ⅞" cove	28 lin. ft.
Pilaster caps	8 units
Pilaster bases	14 units
Turned wood urns (7½" dia. x 23" high)	2 units

Cellar bulkhead:

⅞" x 4" M. & B. ceiling to cover	50 sq. ft.
⅞" x 6" fascia	20 lin. ft.
⅝" x ⅞" cove	20 lin. ft.

Louvres:

(Fixed louvres in wood frames, with wire screens on back)

2' 0" x 1' 0"	4 units

Roof scuttle:

3' 0" x 6' 6" batten door, etc.	1 unit

Windows:

Frames complete with sash, outside trim, etc. Sash 1½" thick, glazed D. T.

Cellar windows:

Single top hung casem. sash 2' 0" x 1' 0", 2 light	2
Single top hung casem. sash 2' 8" x 1' 0", 3 light	2

First and second floor windows:

Single D.H. sash, 2' 10" x 4' 4", 12 light	17
Single D.H. sash, 2' 0" x 4' 4", 8 light	3
Single D.H. sash, 2' 0" x 3' 4", 8 light	2
Double casem. sash, pr. 4' 0" x 5' 8", 20 light	3
Single casem. sash, 2' 0" x 5' 8", 10 light	2
Double casem. sash, pr. 4' 0" x 4' 4", 16 light	3
Single casem. sash, 2' 0" x 4' 4", 8 light	2
Triplet D.H. sash, ea. 2' 2" x 3' 4", 12 light	2
Triplet D.H. sash, (1) 2' 10" x 4' 4", (2) 1' 0" x 4' 4"	2

Exterior door frames:

1¾" thick rabbeted. Complete with outside trim.

Frame for front entrance door, 2' 10" x 6' 8", fixed transom sash 2' 10" x 1' 0" glazed leaded glass, ornamental trim, etc.	1 unit
Frames for side entrance doors, 2' 8" x 7' 0"	2 units

Exterior doors (all to detail):

Front ent. door 2' 10" x 6' 8" x 1¾", 6 panel	1 unit
Side ent. doors 2' 8" x 7' 0" x 1¾ glazed	2 units

Finished flooring:

13/16" x 2¼" oak—to cover	2500 sq. ft.
Lining paper under floors	2500 sq. ft.

Joist hangers (¼" x 2" W.I.)

For 2" x 10" beams	10
For 4" x 10" beams	6

Interior Finish

Door trim (whitewood):

⅞" jambs, ½" stops, ⅞" x 4½", moulded and mitered with wall moulding. Trim both sides.

For doors 2' 6" x 6' 8"	21 sets
For doors 2' 4" x 6' 8"	9 sets
For pr. doors 4' 0" x 6' 8"	6 sets
For pr. doors 3' 0" x 6' 8"	10 sets
For cellar doors 2' 10" x 6' 8"	2 sets

Trim for inside of exterior doors:

For front entrance with transom, etc.	1 set
For side entrance 2' 8" x 7' 0"	2 sets

Trim for windows (whitewood):

⅞" x 4½" moulded and mitered trim with wall moulding, ½" stop, 1⅛" moulded stool, ⅞" moulded apron, ⅝" x ⅞" cove under stool.

For windows, single, 2' 10" x 4' 4"	17 sets
For windows, single, 2' 0" x 4' 4"	3 sets
For windows, single, 2' 0" x 3' 4"	2 sets
For windows, double casem., pr. 4' 0" x 5' 8"	3 sets
For windows, single casem. 2' 0" x 5' 8"	2 sets
For windows, double casem., pr. 4' 0" x 4' 4"	3 sets
For windows, single casem. 2' 0" x 4' 4"	2 sets
For windows, single, 2' 0" x 4' 4"	2 sets
For windows, triplet, each 2' 2" x 3' 4"	2 sets
For windows, triplet (1) 2' 01" x 4' 4", (2) 1' 0" x 4' 4"	2 sets

Base:

(⅞" x 6" moulded)	600 lin. ft.
2" base mould	600 lin. ft.
Picture molding (⅞" x 2¼")	500 lin. ft.
Mantels for living rooms	2 units

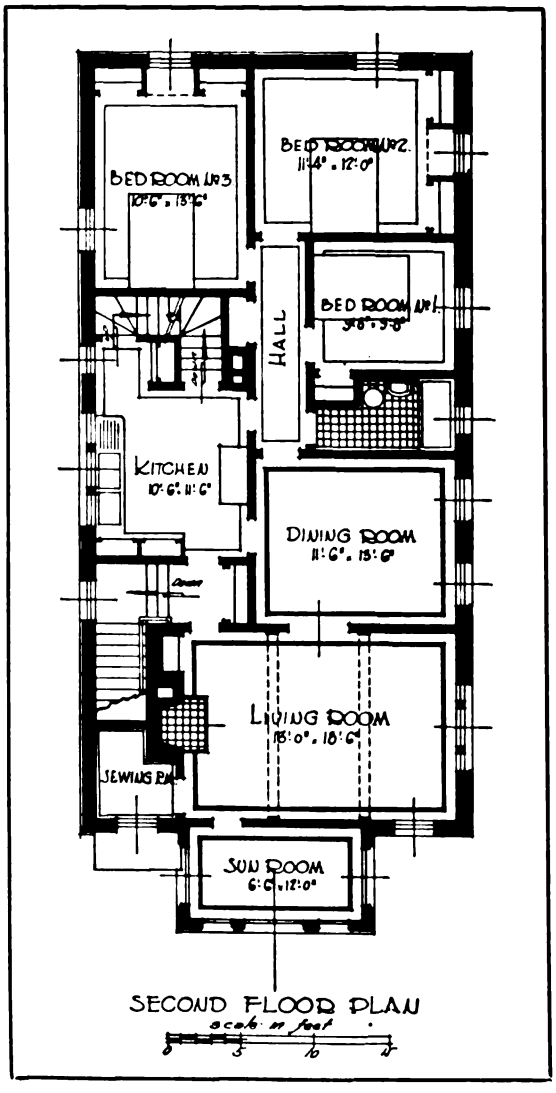
Interior doors:

(2 cross panel birch veneer)

Door 2' 6" x 6' 8" x 1⅜	21
Door 2' 4" x 6' 8" x 1⅜	7
Door 2' 4" x 6' 8" x 1⅜ glazed	2
Door pr. ea. 2' 0" x 6' 8" x 1⅜ glazed	6
Door pr. ea. 1' 6" x 6' 8" x 1⅜ glazed	10
Door 2' 10" x 6' 8" solid pine	2
Door 3' 0" x 6' 8" solid pine	2
Whitewood doors to plumbing pipes. 1' 6" x 3' 0" x 1⅛"	2
Closet shelving (⅞" x 12" pine)	110 lin. ft.
Hook strip (⅞" x 4")	130 lin. ft.
Rabbeted shelf cleat	80 lin. ft.
1" dia. pipe clothes rod	38 lin. ft.

Kitchen cupboards:

(With countershelf, drawers, doors, etc.)



Front 6' 0" x 8' 0"	2 units
Front 4' 0" x 8' 0"	2 units
Front 2' 8" x 8' 0"	2 units

Main stairs. First to second story:

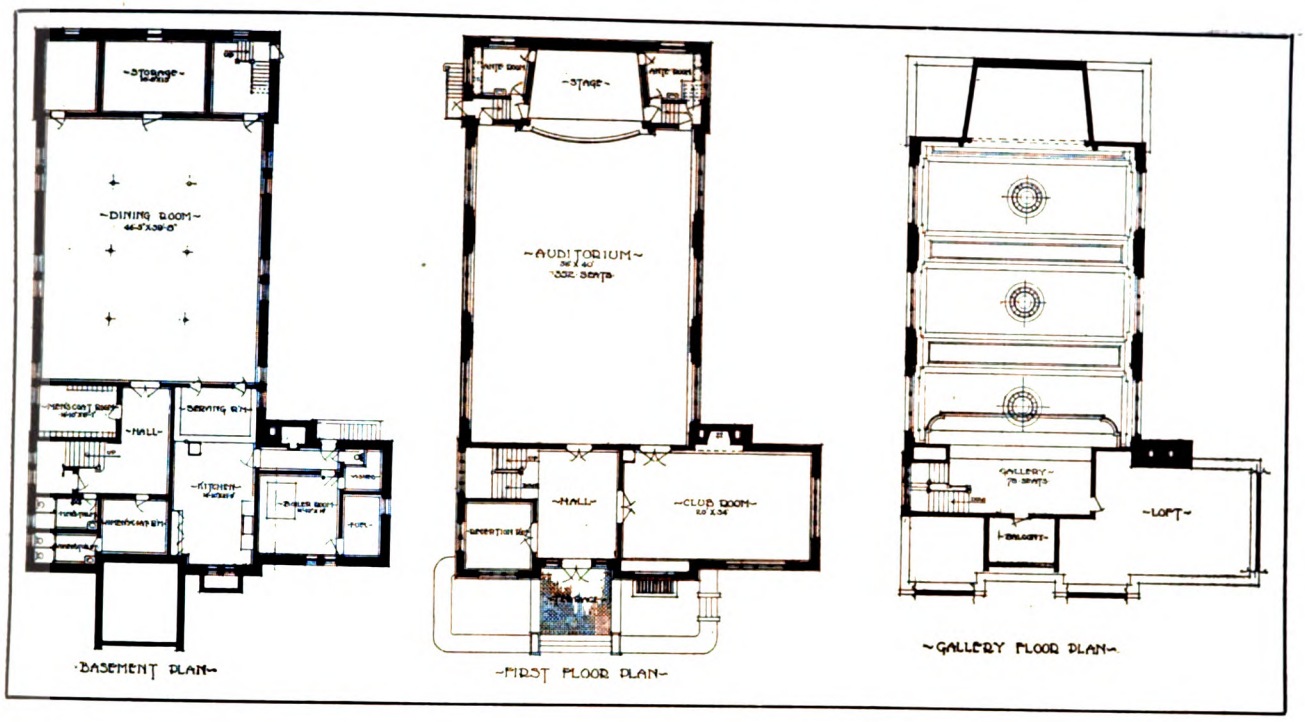
14 risers, 3' 6" wide, box pattern, wall hand rail, etc. (birch)	1 flight
Cellar stairs, first to cellar, 12 risers	1 flight

Service stairs:

Cellar to first floor—12 risers	1 flight
First to second floor—14 risers	1 flight
Second to roof—14 risers	1 flight

SECOND FLOOR PLAN

scale in feet



General Conditions

Add for permits, fees for water and sewer connections, etc., insurance and general overhead charges.

Allow for general work not listed, such as grading, planting, etc.

Include: sub-bids: Hardware and applying same, painting and decorating, plumbing and gas fitting, heating, electric work.

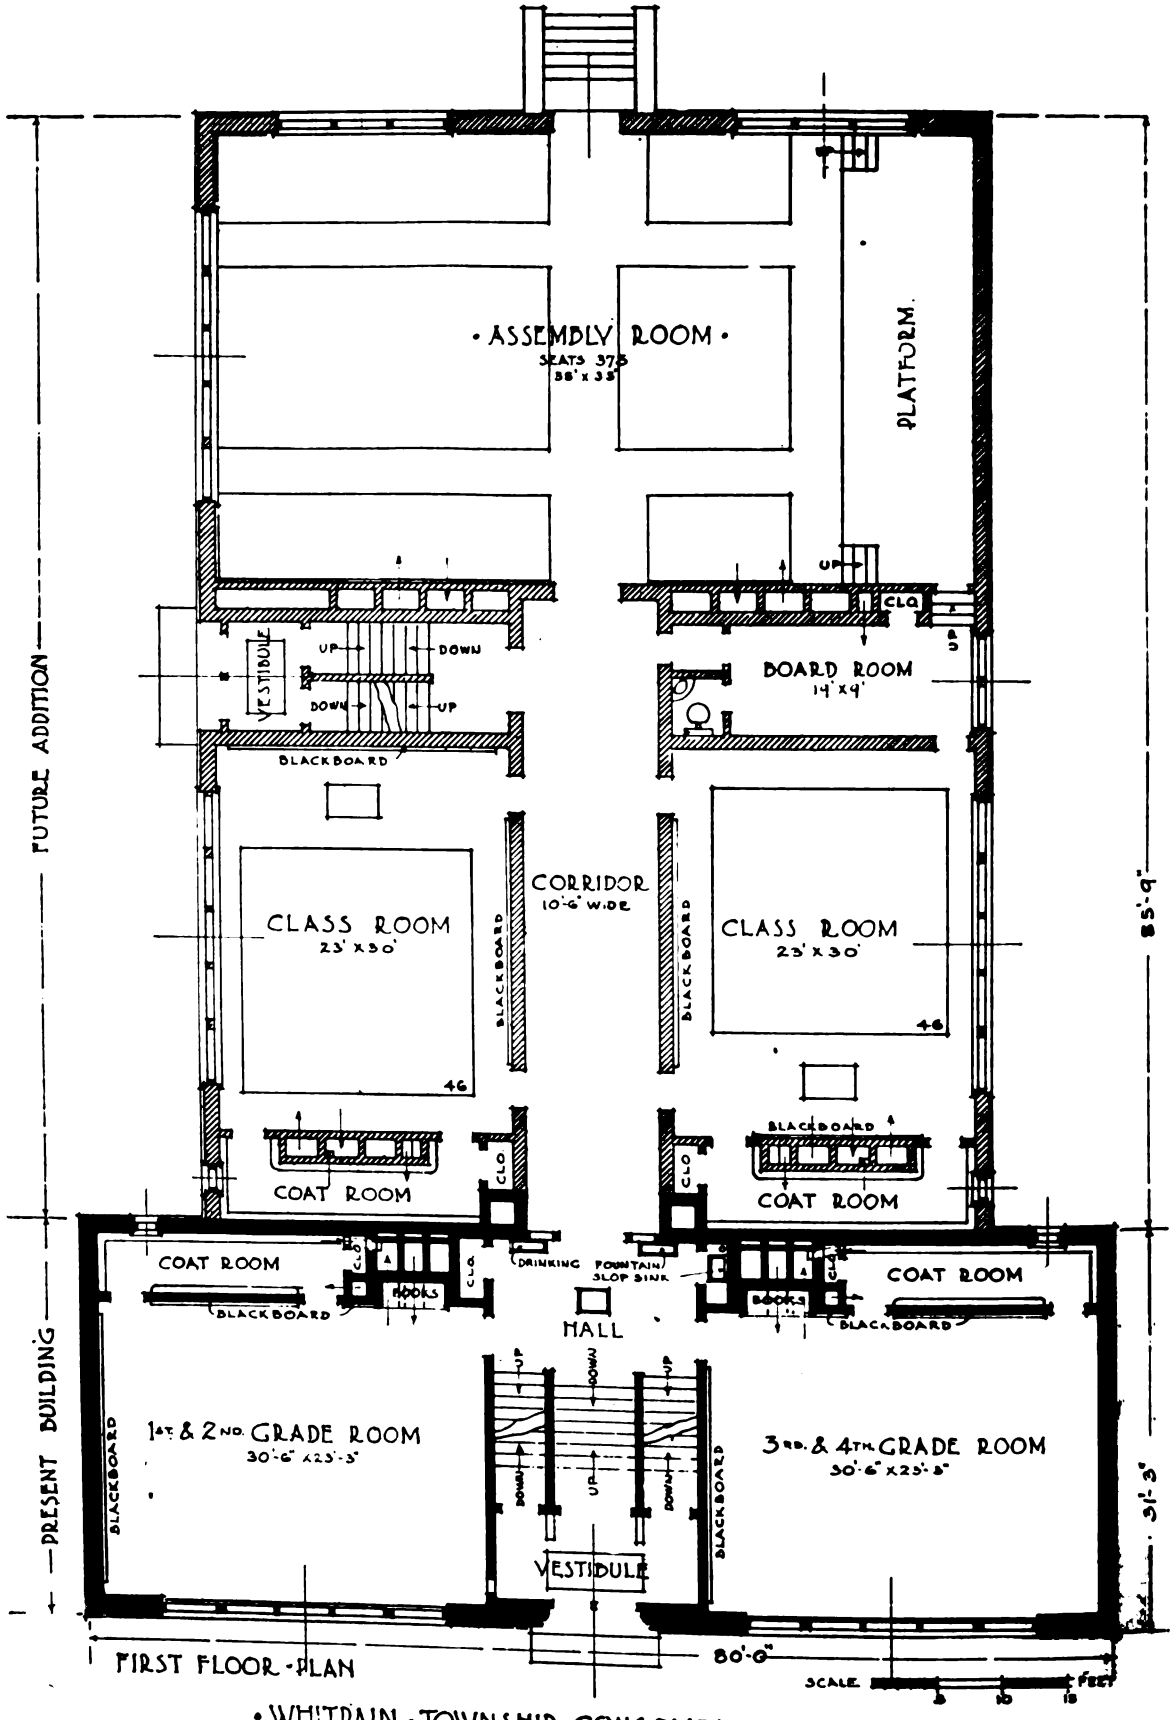
Model Club House

Interesting Design for a Community Building

COMMUNITY interests more or less develop the club house idea and as this is quite an interesting subject, we think it is opportune to show here a good design of a successful country club.



This particular club house, as shown in the above picture, is the home of the Twentieth Century Club situated at Landsdowne, Pa. The exterior design follows English lines and is distinctly pleasing. It is set on a terrace and this adds to its looks.

An examination of the floor plans given above will show that every likely want has been well taken care of. There is a good size auditorium in which various meetings and entertainments are held. Directly underneath this auditorium there is a dining room, which is capable of accommodating quite a good sized crowd. There is also club room, smaller office rooms, etc., besides necessary toilet rooms. An adequate size kitchen has been provided as well as sufficient room for the heating plant and coal storage.

This club house was erected from plans prepared by Heacock and Hokanson, Architects of Philadelphia, and the contractor of the job was George W. Grover of Morton, Pa.

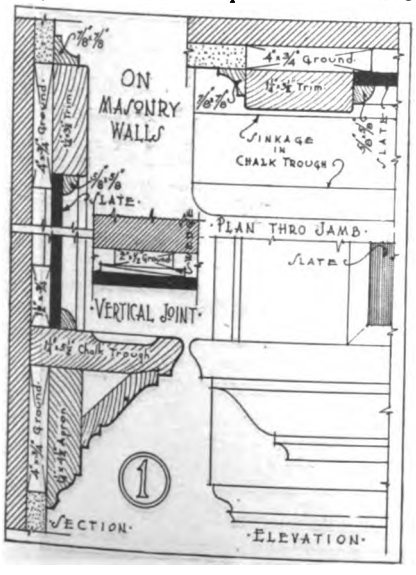
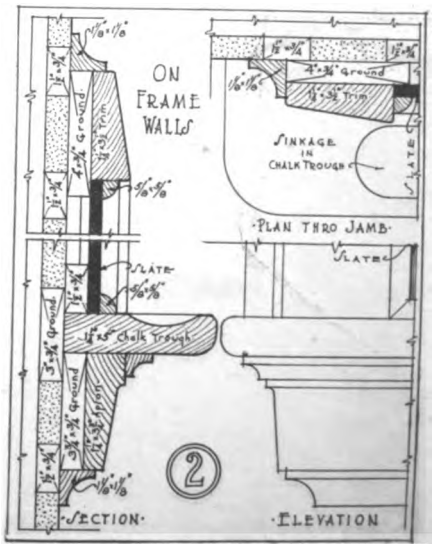
School Planned for Future

Pennsylvania School Design Arranged for Contemplated Addition

WHEN a school is being thought about some attention should be given to future needs as well as present requirements. This has been done in the Whitpain Township Consolidated School, erected near Bluebell, Montgomery County, Pennsylvania.

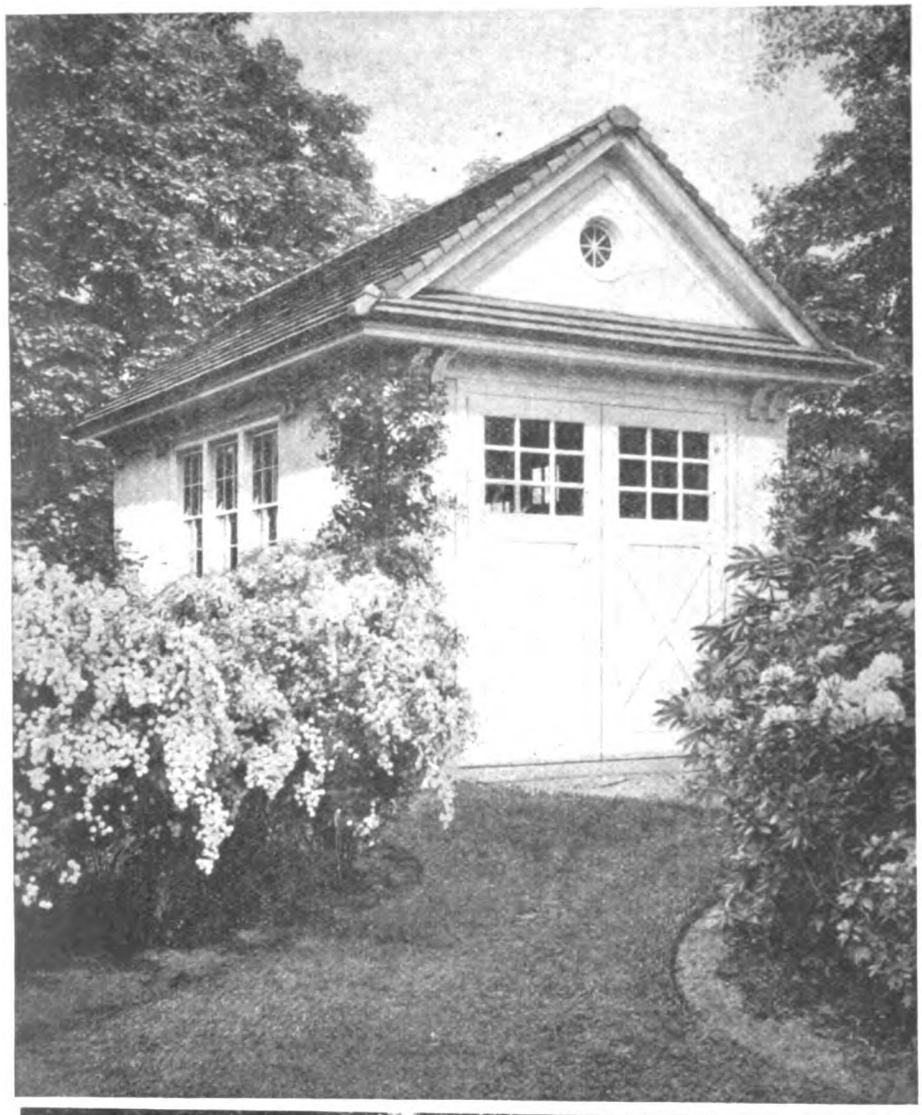


From the plan given on the opposite page future requirements have been planned for. The structure as shown in our picture consists of four class rooms, the new addition that will be built sometime in the future will contain six class rooms besides the large assembly room, which is to seat 375 pupils, this room, as well as all of the class rooms have been designed so that the pupils will receive the light from the left.



This school building is designed along the lines of English College buildings. The foundation is of local stone and above this brick is used with limestone trim. The building is heated and ventilated by a fan furnace system, the fan being operated by an electric motor.

This building was erected from plans prepared by C. E. Schermerhorn and Watson K. Phillips, Associate Architects, Philadelphia, Pa. The general contractor of the job was Alexander Chambley, also of Philadelphia.



As many builders are interested in the best way of erecting slate blackboards in schools, we give two details of approved methods of doing this, the one is suitable for brick wall, the other detail is for frame construction. These details were kindly supplied to us by the Structural Slate Company.

The use of slate in school buildings is steadily growing more popular; it makes excellent treads for iron stairs, toilet inclosures, and for shower bath stalls.

Private Garages

PRIVATE garage designs are common enough, but the two shown on this page are a little out of the ordinary. The top picture shows a one-car garage at Bethlehem, Pa., this is built of hollow tile covered with stucco, and has a tile roof, being in conformity with the house of the owner. Mr. C. E. Schermerhorn of Philadelphia was the architect. While the garage is of good design, its best points are emphasized by its attractive setting; flowering shrubs well placed have a lot to do with making a picture.

The lower picture shows a garage and summer house built at Lansdowne, Pa., from plans prepared by Bunting and Schregby, architects, Philadelphia. This is somewhat of a novelty, but of course is only possible on a side hill site. The garage proper is built of concrete, and there is nothing out of the ordinary in the design of this part of the structure, but instead of an ordinary roof, a porch-like treatment has been given to it, the roof proper being on top of this, the result being a very inviting summer house.

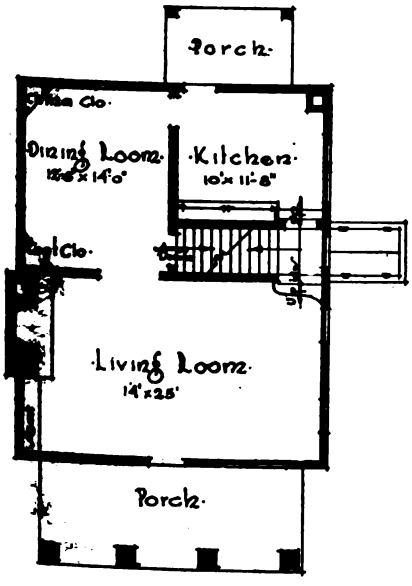
Neat Cottage Design

No Floor Space Wasted in This Five Room House

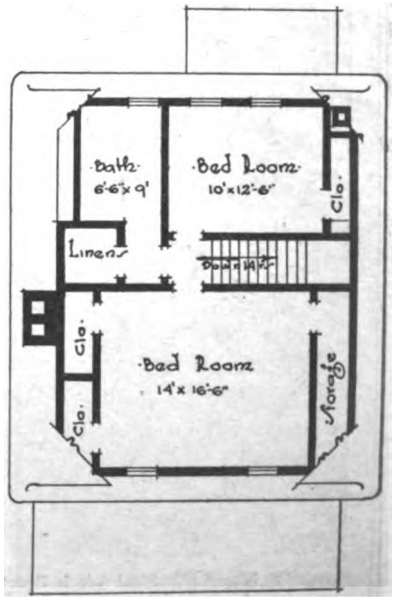
HERE is a small cottage design that is neat, well proportioned and tasteful. The exterior is covered with wide clapboards, the corners being mitered. The roof treatment is worthy of special mention as it is somewhat out of the ordinary, as it has a thatched effect. The gable treatment is quite unusual, and certainly has been well handled.

From the angle our photograph was taken the chimney appears to be rather tall, but it is not higher than necessary to secure a good draft. The pitch of the roof is quite steep. This allows the walls of the rooms on the second floor to be square without any cut-off at the sides. The porch floor is cemented and four large colonial columns support the roof, as shown in above picture.



The house as will be noticed sets close to the ground. This takes away from the high appearance that it would have if it was elevated two or three feet above grade.

The room arrangement has been very carefully thought out to secure the maximum amount of comfort from the minimum amount of room. The living room is of good size and goes across the entire front; open fireplace on the left hand side in the corner makes rather a cheery nook of this part of the room, a seat extends from fireplace to front wall.



The dining room is small but ample in size for the necessary furniture without being the least bit cramped. The light kitchen with its cozy and compact arrangement will certainly please the housewife.

Two bedrooms and bathroom are provided on the second floor. There is a minimum amount of hall space so there is practically no waste space whatsoever.

This home shown here was designed and built by J. Walter Ketterer, Architect, of Butler, Pa., for his own occupancy.

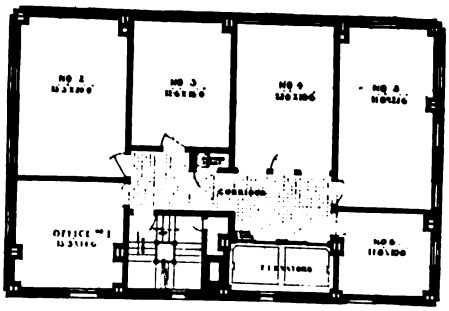
Rapid Building Construction

12 Story Office Building Erected in 294 Days by Hoggson Bros., Builders, New York

Pop's Lunch Room Occupied the Site of the New Building Until February 1, 1921.

On May 1 All Steel Work Erected and Masonry Work Completed for First Story

The Bank and Office Building Completed Ready for Occupancy November 21, 1921.



Digitized by Google

BUILDERS are always interested in the rapid execution of a contract and the pictures on the opposite page depict the condition and dates of a remarkable performance in the building of the Citizens Trust Company, at Terra Haute, Ind. We believe the completion of this building in one of our smaller cities holds the record for such a performance.

The site of this bank and office building was occupied by a two story brick building up to February 1st, 1921, when its demolition began. Our next picture was taken on May 17th, 1921. This shows the entire structural steel work for the twelve stories in place, and the masonry work has just started. The third picture was taken on November 21st, 1921, and shows the entire structure complete and occupied on that date.

This entire building operation was completed in 294 days, including Sundays and holidays, and in this time the buildings on the site were demolished, excavation done, the proper foundations for the heavy structure placed, and the entire super-structure erected; besides, the bank proper had all its equipment installed including vaults, decorations and furnishings. All the offices on the upper floors were also in completed condition on that date.

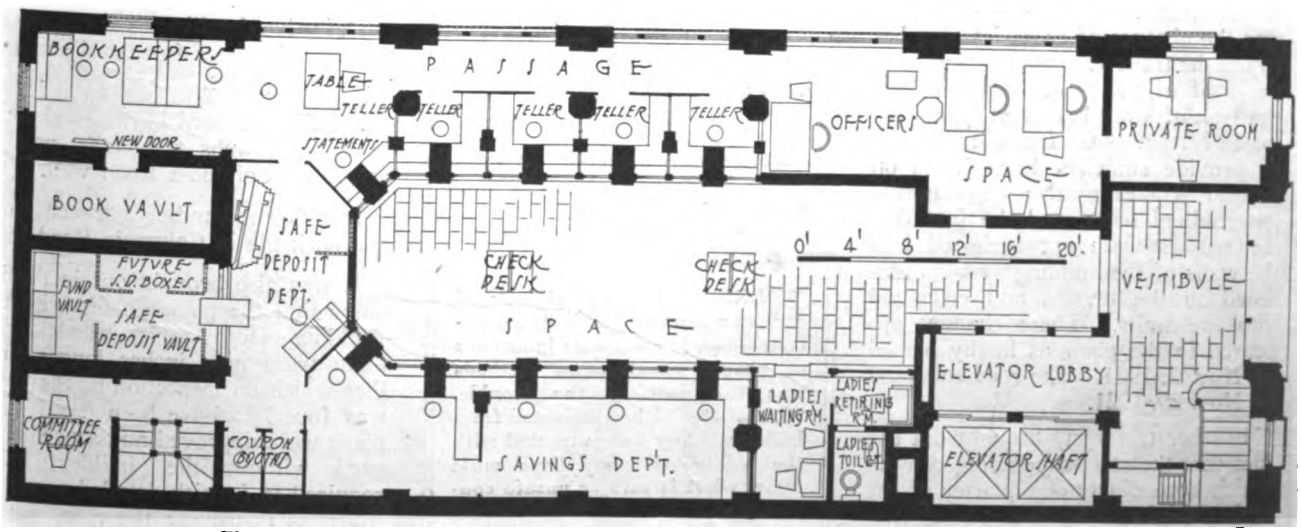
Of course an operation like this cannot be carried on except by a systematic building organization. Hoggson Brothers of New York and Chicago, designed as well as erected this building. Material had to be ordered in advance and scheduled to be delivered at the time it was needed. It is to the credit of Hoggson Brothers' system that everything went like clockwork.

Arrangement of Upper Floors

It is not to be wondered at that such a building operation in a city like Terra Haute, Ind., should have caused quite a good deal of comment. It is the tallest building in that city and to have it erected in such record time gave the natives something to talk about. Naturally, the Citizens Trust Company received a good deal of desirable publicity through the building activity that they instigated.

This building, as has been stated, is twelve stories high. The steel framework is enclosed with brick walls, exterior being faced with dark red pressed brick, with base of limestone. The cornice is of ornamental Terra Cotta.

The office part of the building is built as sort of a tower so as to provide permanent light and air at the rear. The building is equipped with two speedy elevators with an automatic device, which insures cars being brought to a stop at level of floor.



There is a visitors' promenade around the roof from which an extensive view of the surrounding country can be obtained.

The upper diagram shows a typical floor plan from the second to the eleventh floor inclusive. On the second floor the space designated as office No. 6 is occupied by the main stairs. Office No. 3 on the seventh floor is occupied by the ladies' toilet and the same space on the eighth floor is given over to the men's toilet.

The lower plan shows the arrangement of main floor. The bank and offices are reached through a common entrance. The banking room occupies the entire first floor together with front and rear mezzanines.

Our plan also shows the arrangement of the banking space. Particular care has been taken in the planning, so as to obtain maximum efficiency from bank help with the greatest convenience to customers.

Of course, the equipment and vaults are in accordance with the best modern practice. The banking room receives light from the large side windows, and skylights in the roof. The counter in the banking room is of Tavernelle Fleuri marble. The public space has a Tennessee marble block floor. The woodwork, the desks, etc., are of mahogany. The several large columns that appear in the banking space have ornamental caps, fashioned after the composite order. The beams are of ornamented plaster in harmony with the other architectural details.

WHY THE ROOF FELL

Startling Disclosures in Court Proceedings Strip the Brooklyn and Washington Theatre Disasters of Supposed Mystery, Over 100 Lives Sacrificed to Ignorance of Proper Construction

ONE primary fault was not the cause of the collapse of the roofs of the American Theatre in Brooklyn, New York, or the Knickerbocker Theatre in Washington, D. C. In both cases it was a combination of many small faults, any one of which alone would not have caused the catastrophes. Just what started the collapse in each case perhaps will never be learned as both occurred so swiftly with complete wreckage.

That the steel work of the American Theatre, at Bedford and Park Avenues, Brooklyn, was constructed on plans not approved by the Building Department and that the work was practically completed before the plans submitted to the Building Department were approved was brought out at the hearing to fix responsibility for the collapse of the structure and the consequent loss of seven lives.

The plan examiner employed by the Building Department, who had complete and final authority as to the safety of the plans for the new theatre, asserted that on Oct. 7, 1921, and again on Oct. 25, 1921, he objected to the plans for the steel work submitted to him by Joseph Gaydica, to whom the contract was awarded for furnishing the steel.

There were twenty-one objections to the plans. The most important was the absence of cross-framing between the transverse trusses on which the roof of the theatre was to rest; the lack of sway braces in spaces between certain of the trusses; a failure to provide sufficient knee joints on several trusses that rested on the longitudinal truss, and the fact that the trusses were not anchored into the walls of the building by bolts fastened to the trusses and cemented into the walls. These changes appeared in the plans as finally passed on Nov. 2, 1921. The roof collapsed on Nov. 29, 1921.

Further testimony brought out the fact that the steel supporting column which bore nearly one-quarter of the entire weight of the roof was set into place without the supervision of the steel contractor and the bearing plate was a patch-work of small pieces of steel!

This column was plumbed by eye only, so the steel erector testified. In our January issue we called attention to the fact that it was the slipping of this column that caused the collapse. Is it any wonder?

It seems the original plan called for a wall but the substitution of columns would provide room for seventy additional seats.

AT the Coroners' inquest of the Knickerbocker Theatre disaster in Washington, a report was made by five Army and Navy engineers on the cause of the collapse which was attributed to a failure to sufficiently provide for the unusual conditions existing at the junction of the curved Columbia Road wall to the stage wall.

The 21 "evidences" of weakness in the structure, as set forth in the Army and Navy experts' report follow:

Use of tile walls to carry heavy concentrated loads.

The unusual height and length of the unsupported tile wall on Columbia Road.

Lack of a column with knee brace or pilasters under the main truss at the wall.

Inadequate bearings of beams on the tile wall with small bearing plates, regarded as particularly important in conection with the "skew" bearings.

Absence of concrete fill in the tile at beam bearings with wall bearing plates on edges of tiles.

HERE are the official facts of two lamentable building catastrophes, in each case ignorance of proper construction methods was the root of the trouble. "Guess" should be eliminated from building. Any one entrusted with the safety of many lives must know what is safe or unsafe construction.

Insufficient anchorage of steel to walls.

Roof slab too thin for span and loading and insufficient steel reinforcement.

Absence of restraint at sides of roof slabs.

Ceiling load concentrated in centre of roof slab.

Short bearing of main truss on lintel, and truss not stiffened for bearing.

Absence of bracing between steel members, and particularly at ends of main truss.

No stiffness in connection of main truss to column.

Use of bolts instead of rivets on all field connections and insufficient bolts at truss connections.

Column top and splices not milled.

Reinforcing steel in roof slab was not raised over the beams to take negative bending over supports.

No evidence of increase of re-in forcement in end panels of slabs.

Heavy load of nine and one-half inches of cinder concrete fill at centre of drainage ridge.

Loads of ventilating equipment where cinder fill occurred and absence of special bracing to take vibration.

Defective detailing as witnessed by absence of splices for chord and end post cover plates.

All tile not hard burned and some have scant webs and walls, notably at top of Columbia Road wall.

Insufficient bonding between front and back tile in Columbia Road wall.

It was also brought out in the inquiry that the plans on file with the Building Department called for a main truss nine inches longer than that which on inspection of the ruins was found to have been used. The plans were approved and a permit issued without the builder being required to furnish detailed specifications, as is usually the case, for all metal work.

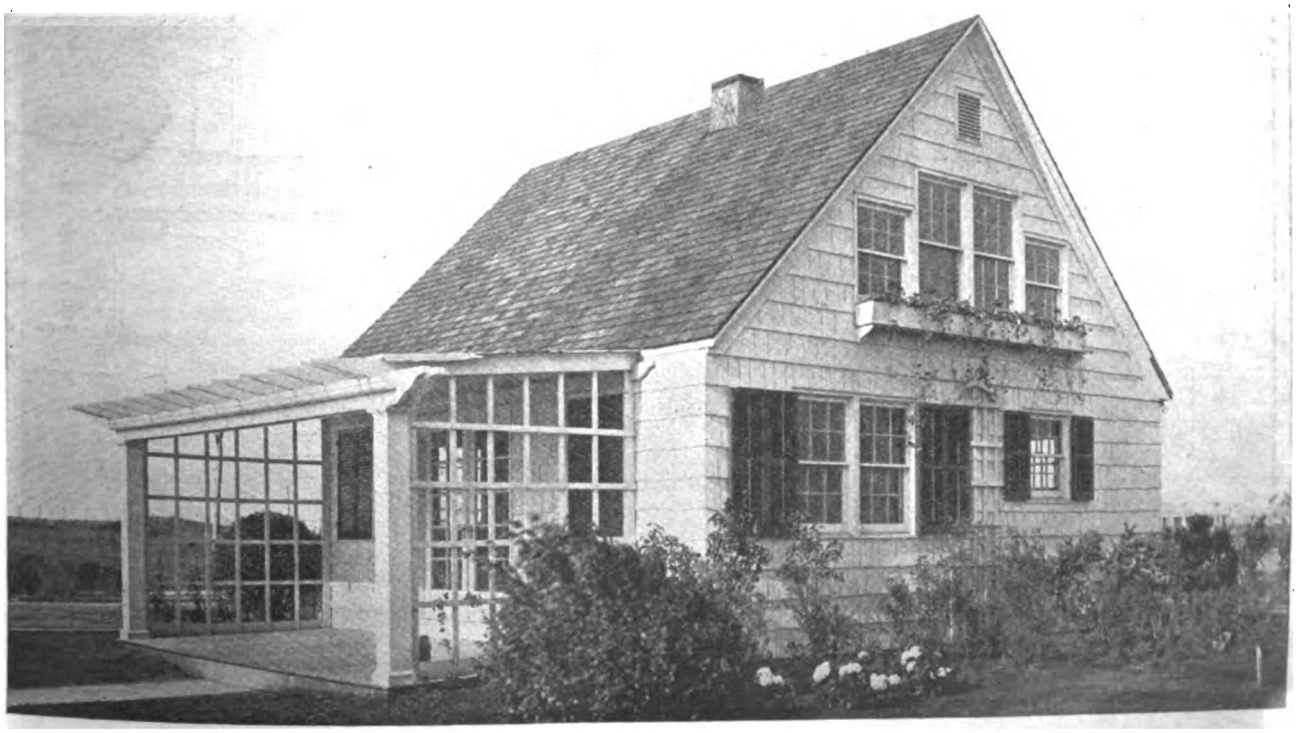
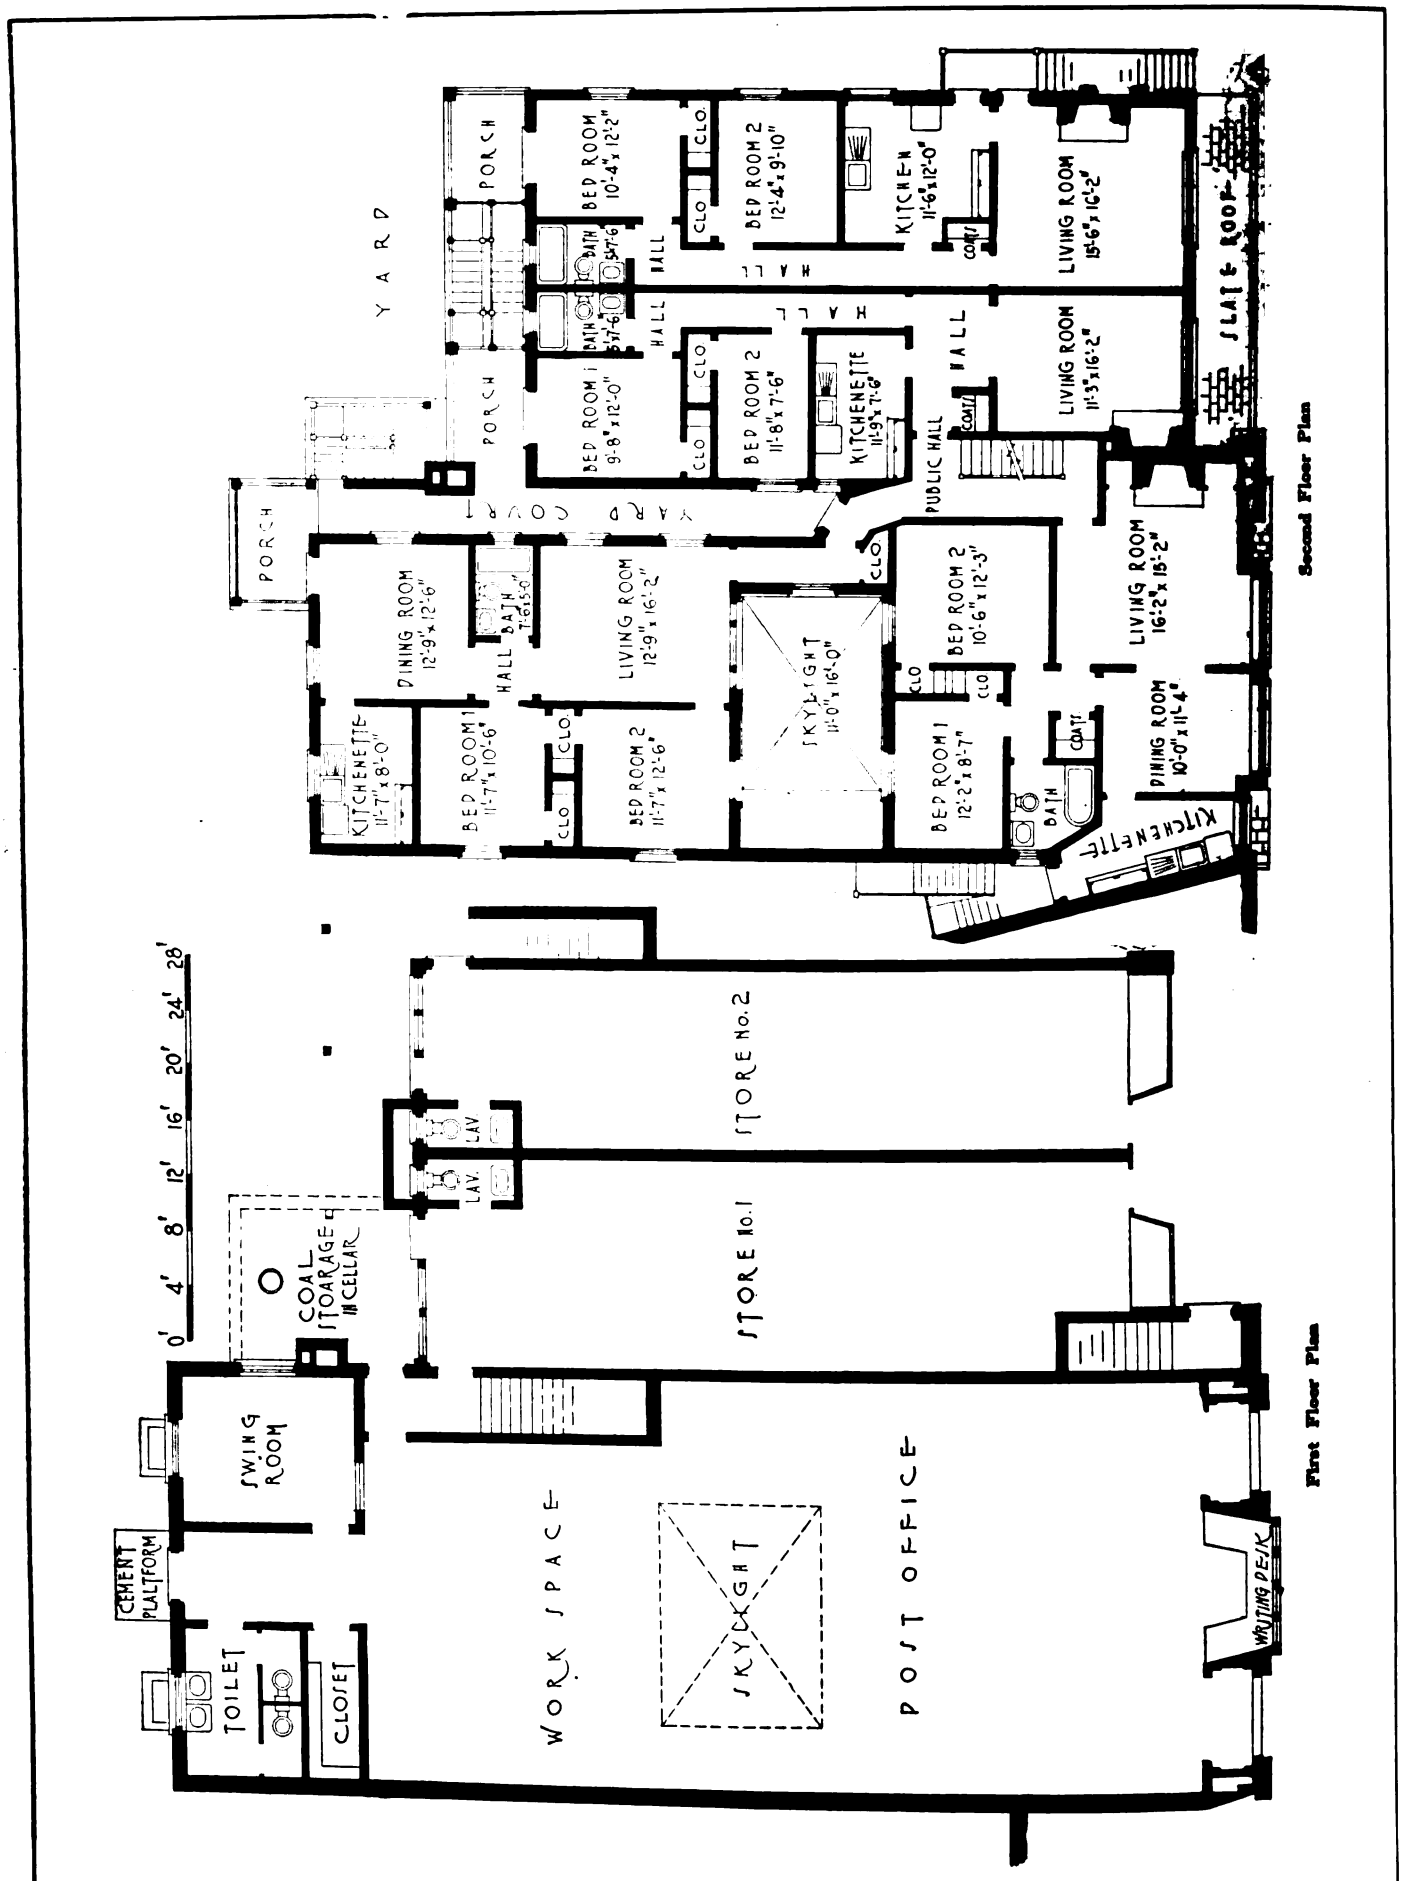
Development Field Offices



OPENING a new tract of land for sale in lots, the experienced developers use different methods to get people interested to buy. Of course the necessary grading, sidewalks, water and gas pipes, electric poles, etc., will have been installed and an attractive name selected for the property.



The builder is often called upon to submit a design for such a building and the three buildings shown on this page will give some valuable suggestions. There is nothing elaborate about any of the designs, but they are simple, in good taste and can be built at a moderate price.

In the upper design note how the roof has been laid of red and green chipped slate composition shingles, thus obtaining novel effect. The lower design with its large latticed porch is very inviting, it gives a feeling of hominess at once. The upper picture is a quaint little house with an attractive outside chimney.

In erecting these field offices one should avoid freak or ugly buildings with their sides covered with lettering about the wonderful bargains in lots. An attractive field office is one of the best ads a builder can have in a new location. Let your good work appear here, it will be critically examined and if well done will mean good jobs for you in the near future.

Old English Design for Stores and Apartments

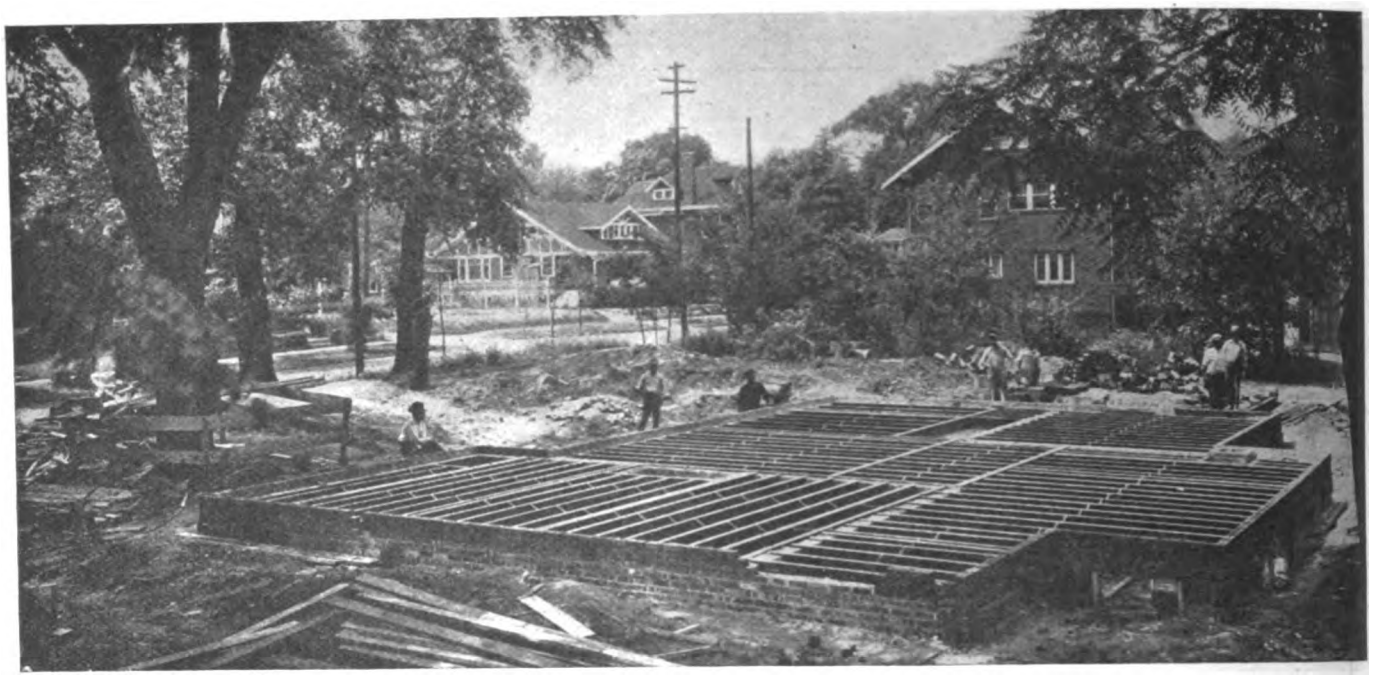
Quaint Fronts on Modern Buildings Produce Striking Effect

MAIN street in most of our American towns presents a rather monotonous appearance as far as the buildings go. One structure is practically the same as the other—just a common store front with perhaps a three window arrangement upstairs for the apartment and decorated on top with the conventional cornice. There is practically no beauty or individuality in their design. One can look in one town and really see the Main street of most of the others.

Builders can overcome this lack of artistic design in the future by suggesting to their clients the desirability of putting up something that is a little more artistic. Speak about the advertising value an attractive structure will have, it gives people something to talk about, and that is what a business man wants.

Banks have been vieing with one another to produce good looking structures for their business homes, but other merchants can do just as much in their own way. There is really no excuse for an unattractive modern commercial or flat building.

We show above a very unusual and artistic apartment building with stores below; the larger store is occupied as a post office, and this part alone would be a very attractive building, but linked with the others it really forms an interesting picture. The idea of putting the large chimney in the front is a very unusual feature, but very striking.



This attractive building was built at Upper Montclair, N. J., from plans prepared by Francis A. Nelson, Architect, New York, the construction was done by Messrs. Peterson and Benson, builders of Montclair, N. J.

This store and apartment dwelling is built of brick and the use of face brick together with certain portions in stucco with ornamental half timber effects, forms a very striking front. Having one portion of the building set back from the front line is another innovation that creates a better appearance.

The entrance to the main apartments is from the side instead of the front, as is ordinarily done. The right hand side apartments are reached by an outside stairway which to some would appear rather strange, this stairway however, is only temporary. The development of the adjoining property contemplates carrying out the same style architecture, and joining it to this right hand end of the present building; the outside stairway will then be replaced by a regular stair and hall.

The roof, as will be noted, is covered with thick slate shingles laid at random in the Old English fashion; the slate is of variegated colors, so an artistic looking roof results.

Metal Lumber Joists in Place for Fire Proof First Floor of Residence

Fire-Safe Home Building

Practical Low Cost Methods of Building Fireproof Floors in Small Houses Thereby Reducing the Fire Hazard

By GILBERT CANTERBURY

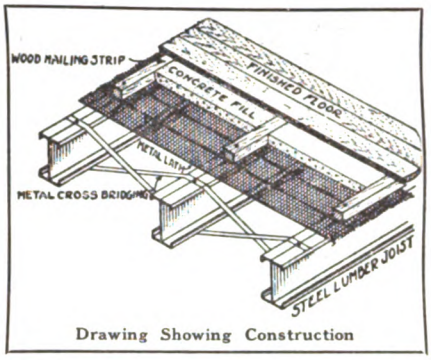
IT is rapidly becoming recognized among contractors and others of the building industry that in order to provide safety from fire in the dwelling house type of construction it is only necessary to use fire resistive materials at certain vulnerable points in the structure.

In the work of establishing these vulnerable points it has been developed that a goodly majority of dwelling house fire hazards are located in residence basements. The chief of these hazards are such equipment as furnaces, ash bins, hot water heaters, laundry stoves and fuel supplies, to which may be added gas meters, electric meters, horizontal pipes, hot air ducts, etc.

In considering the problem presented by this accumulation of hazards in one section of the home, fire experts have agreed that construction of a fire resistive first floor over the top of brick, tile, concrete or stone foundation walls will isolate the chief causes of fires and give a large measure of safety to the livable sections of a home regardless of the materials out of which the upper structure has been built. Compilation of reports by the National Board of Fire Underwriters covering a period of five years and some 3,500,000 fire insurance adjustments has disclosed that stoves and furnaces are responsible for fires causing loss of $55,133,181.00; hot ashes and coals $11,806,754.00; rubbish and litter $3,511,824.00; spontaneous combustion $49,702,886.00. It is obvious that most of the fires in dwellings coming under these classifications of causes would have their origin in the basement.

The contractor, bearing in mind these facts, has made the discovery that fire safe construction can be applied to dwellings at surprisingly low cost. The four basement walls of homes are invariably constructed out of incombustible materials and since the first floor, which formerly was universally constructed out of wood, has been proven the most vulnerable point, the simple remedy has been found to be the elimination of combustible material in the under side of this floor.

Numerous methods of building the first floor fire safe have been tried in various parts of the country and one method known as the steel lumber firesafe first floor has been growing rapidly in popularity. In this construction, light steel joists are used as floor supporting material. Metal lath is spread over the tops of the joists and 2x2 wood screeds run lengthwise with the joists, the attachment being made by driving nails down through the lath into the steel joist web. Concrete, either stone or cinder, is then filled in between these screeds and the usual hardwood surface applied by nailing into the screeds. This eliminates all combustible material from the under side of the first floor and yet preserves the desirable wood surface. The total extra cost of a home using this system amounts to only about one per cent. or from one to two or three hundred dollars, according to the size of the building.



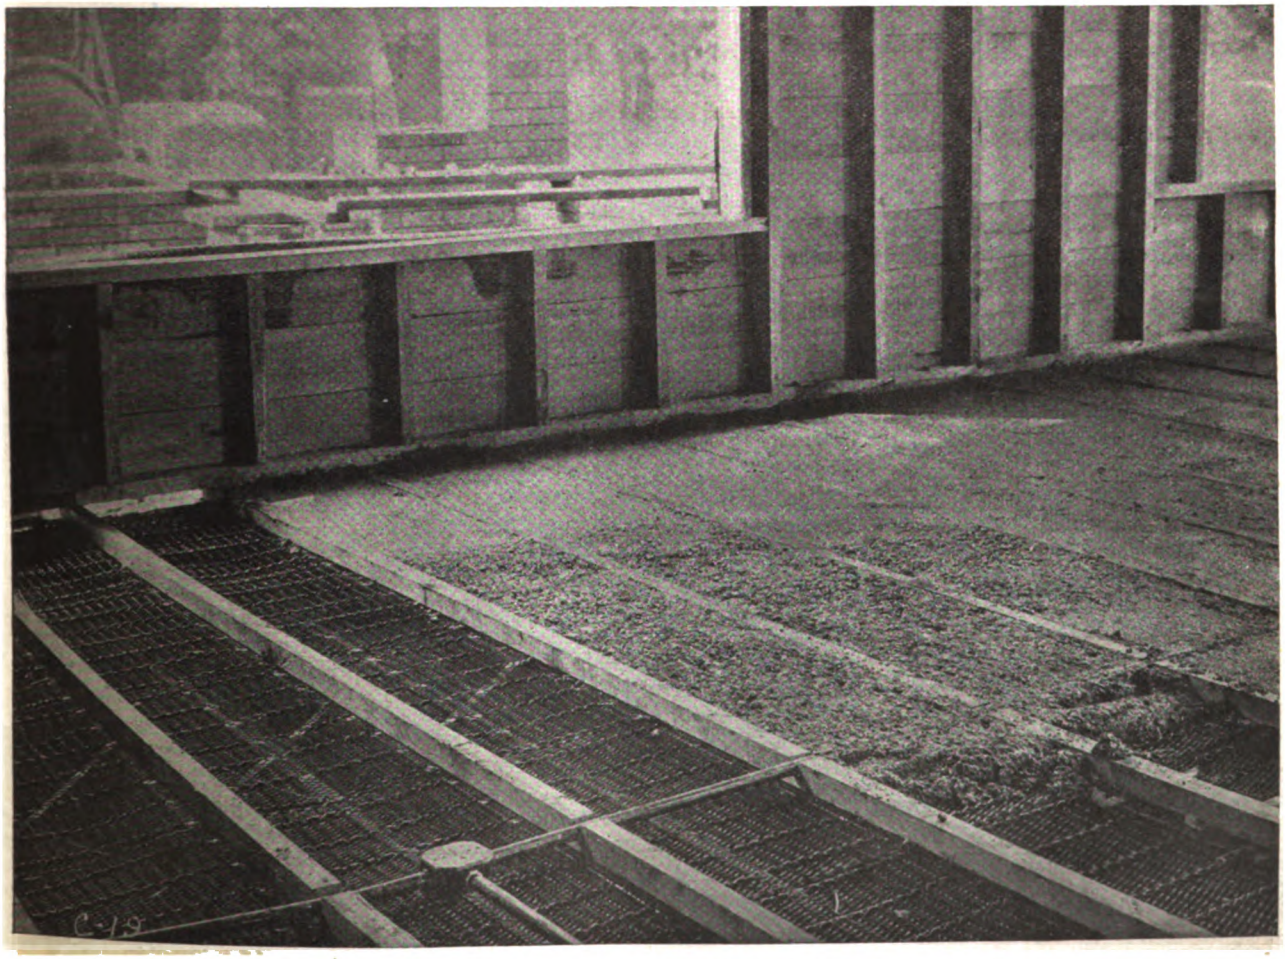
According to insurance statistics, fires occur in American dwellings at an average of eight hundred and eighty-nine per day. It has become popular practice to charge the majority of these fires up to carelessness but contractors, architects and others in the building trade know that the one and only efficient way to eliminate fire loss is to build structures so that they cannot burn. It has been es-

Digitized by Google

timated that a universal adoption of the fire safe first floor principle in dwelling construction would eliminate seventy-five per cent. of our annual fire loss in this class of building. Such a result would mean the economic saving of many millions of dollars every year.

The fire safe first floor principle in dwelling construction developed over a period of several years and is now recognized by building codes of most large cities and made compulsory for multiple residences, apartments, etc., has recently spread to other types of buildings, notably the public school house.

The chief fire hazard of the school house is the heating and ventilating equipment usually located in the basement. At the last meeting of the National Education Association, Division of Superintendence, the following remarks on this subject were made by Mr. J. Albert Robinson, Safety Engineer: "The value of good construction is universally recognized. We are all familiar with the common types of fireproof construction and building materials in use. The several types of construction which are being developed by the steel industry are not yet so well known. It is of very great interest in view of the present cost of building to learn that at only a slightly increased cost over that of ordinary construction the most hazardous portions of the school building may be segregated or cut off by the use of a steel lumber fire safe first floor."



Drawing Showing Construction

Floors in hundreds of school buildings have been built after this manner in the last few years. In the state of Ohio alone ninety-six school buildings have been erected with this type of fireproof floor and the size of these buildings vary from the largest high schools in the state to small township schools in the rural sections.

In the accompanying illustrations are shown the steel joist skeleton of a fire safe first floor of a dwelling at Decatur, Illinois, also a close-up view of the upper side of the floor showing the metal lath and wood nailing screeds in position and the concrete filler just being spread. The wall construction above the first floor, it will be noted in this picture, is of wood.

Aside from the fire resistive feature of the metal lath and concrete floor supported by steel joists, it is worthy of mention that this construction is also vermin-proof and that it can not warp or sag.

Should We Build Now?

Here Are Some Facts and Figures to Help Contractors Answer the Question of the Intending Home Builder

SECRETARY of Commerce Hoover is the home-builder's friend. At least he is consistently advocating and actively encouraging the erection of more homes for the people of the United States. And President Harding himself is as domestic and home-loving a man as can be found in the republic. All official Washington is keenly interested in the subject of homes, not only because homes are the normal and happiest domicile of men and women, but because that nation is most self-reliant whose lines of strength lead straight to the hearthstones of a contented and home-loving people.

This year brings a nation-wide renewal of home-building discussion. With the spring building season at hand this is the time for planning and visualizing the new home with all of its innate appeal to the best instincts of men and women. Many thousands of people have dreamed of that beautiful home that some day they intend to build. But year has followed year and the joys of the new home have never been realized.

Will 1922 be a good year to build a home? Experts declare that it will be. For practically all building materials are down to as near pre-war levels as they are likely to go under the new conditions confronting the world. This is especially true of lumber which is being procured at almost pre-war cost and is being sold by retailers generally at figures as low as the present high cost of handling and transportation will permit. In the very nature of things lumber is expected to advance because of the decreasing supply of forest timber. The man who builds now may be reasonably sure that in the long run he is fully protected in his investment.

But suppose some items of construction do become cheaper. The man who lives in his own home can save enough in rent in a single year to offset any likely temporary reduction in materials, and after that he may be reasonably sure his home cannot be duplicated for less than it cost him. Build now, is the advice of those who know building conditions. And already there are indications of such a renewal of building that probably by the middle of the next building season an advance in the general cost of materials will set in that will represent substantial profit to those who take advantage of the building conditions of early spring.

THE housing shortage in this country will not be overcome within the next five years, even with the best of good fortune. This statement was made by John Ihlder, manager of the Civic Development Department of the Chamber of Commerce of the United States, before the recent housing conference of the American Society of Civil Engineers.

Mr. Ihlder said that even the well-to-do would not be as adequately provided with good housing in 1927 as they were in 1914.

"As for the wage-earner, let alone the poor, their problem will be with us a good deal longer," he said. "Consequently it is part of common sense to base our proposals on the proposition that the campaign will be long continued and that whatever is to produce results must be economically sound." Mr. Ihlder pronounced as dangerous some of the so-called "emergency" housing legislation. He pointed out that during the last two years there has been legislation not based upon any deep study, and designed merely to check, temporarily, certain abuses from which a vocal part of the community is suffering. Legislation designed, not to cure, but simply to reduce irritation, he said, is likely to have effects quite unlooked for.

Mr. Ihlder explained that during the war he was an advocate of government housing for war workers.

"That was a time of real emergency and it had a definite terminal point, the end of the war," he said. "Today the situation is fundamentally different. What we do now has no definite terminal point. Any date we may set is easily changed. What we do now sets precedents.

Speaking of building costs, Mr. Ihlder said that "so far as experience goes, such short cuts to the millennium as government building and management do not promise to reduce real costs. Government operation, not only in this country but in others whose distance gives a haze of enchantment, has, as a rule, proved clumsy, inefficient, and expensive. Certain functions must necessarily be performed by government, but the burden of proof is always on those who would transfer new functions to the government. So far, proof is lacking that governmental construction or management of housing would produce better or as good results in America as would private. But at the same time those of us who hold to this belief must recognize that dissatisfaction with present housing conditions is causing a growing sentiment for direct participation by the government. Our only effective answer is to produce better results through private operation.

"In brief then, the kind of housing legislation which, because of experience, we can count upon to aid, is regulatory, the kind that protects the men who would contribute to the public wealth from the exploiter who would prey upon the public wealth. This kind of legislation, building codes, housing codes, city planning and zoning ordinances, we should perfect and promote, confident that if well devised it will encourage building because it will make investment more secure."

WITH regard to the building industry, in an interesting letter to the editor, S. W. Straus & Co., say:

"There is a continued improvement to be noted in underlying conditions of the building industry, and it is expected that activities during the ensuing year will be on a very heavy scale. There is a healthy inquiry for capital for building purposes, particularly for residential improvements and a large proportion of the outflow of capital for the building industry is being absorbed in financing the construction of these types of structures."

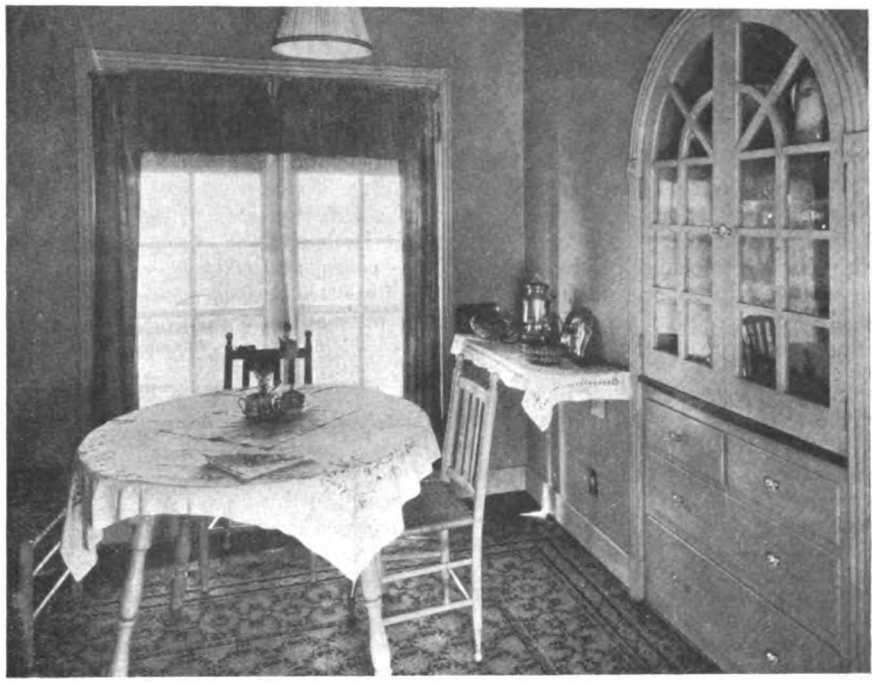
SHOPWORK *and* FURNITURE

Designs for the Finish Man



Diningettes

Two Interesting Designs for Modern Homes

KITCHENETTES are well-known features of small apartments and bungalows and so are breakfast nooks and dining alcoves and now we are coming to the "Diningette."

The high cost of building in the past few years made folks think about space saving and much planning was done to have all the comforts in the smallest possible number of square feet.

Big formal dining rooms are slowly being eliminated from the small home and apartment house designs and this tendency is being reflected in the sharp decline in the demand for dining room sets.

Here are two pictures of the new "Diningette." The top picture shows a simple arrangement of china closet with serving table in shelf form, this being set high enough so that a tea wagon will go under it.

The lower picture shows a neat and cozy arrangement of diningette with its attached kitchenette. Here is a tabloid arrangement that is hard to beat, every comfort is compressed in the minimum amount of room. A "mealette" can be prepared and served here that will taste as good as a banquet in some elaborate dining room.

In designing and building such kitchenettes and diningettes the builder should be sure to introduce the different features that will appeal to the lady. Plenty of cupboard room is essential. Wall plugs and base plugs for different electrical appliances are required.

OFFICE and JOB MANAGEMENT

Things the other man has found out that save money

Short Method of Estimating

By I. P. HICKS

WE will now submit another plan and estimate by our short method of estimating. This time we have selected the plan of a full two-story house of the square build design. It is figured with the reception hall, living room, dining room, and the stairs (up to and including the landing) to be finished in oak, balance of house to be finished in yellow pine trim.

In order to avoid a difficult combination of fractions in the parts figured by the square the fractional parts of squares have been expressed in decimals, which makes accurate figuring a very simple process. The fractional parts of a square being represented by hundredths parts of a square, it is easy to figure any fractional part. This enables one to figure with the greatest of accuracy, leaving nothing to guess at.

Figuring the Mason Work

Excavating 216 yards, 40c	$86.40
Concrete footings, 76 cubic feet, 40c	30.40
Brick laid in foundation, 12,000, $24	288.00
Chimney, 40 lineal feet, $1.60	64.00
Cement floor, 800 square feet, 12c	96.00
Total excavating and masonry	$564.80

Figuring the Front Porch

2.08 squares 2x8 porch floor framing with fir flooring, $24	$49.92
2.08 squares of 2x4 porch ceiling framing with 5/8x3¼ face fir ceiling, $13	27.04
3 squares 2x4 porch roof framing with roof sheathing and shingles, $19	57.00
51 lineal feet porch cornice, 85c	43.25
48 lineal feet porch steps, 25c	12.00
3 porch columns, $6	18.00
25 lineal feet porch rail and balusters, 50c	12.50
25 square feet porch lattice panels, 40c	10.00
Total cost of porch above foundation	$229.71

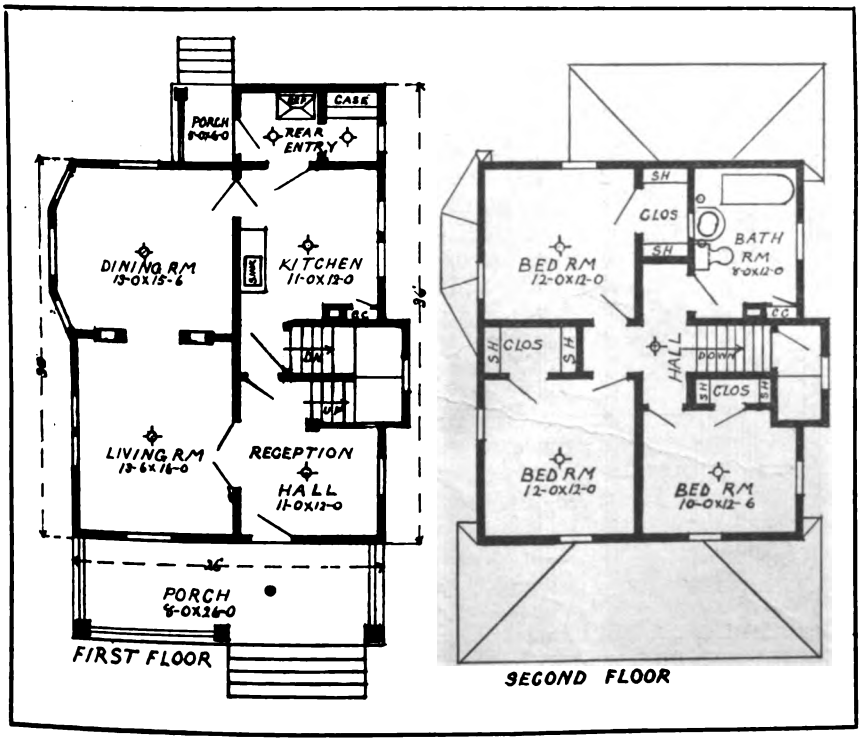
The actual square feet of floor space is 208, which makes the porch figure approximately $1.105 per square foot.

Estimating the Main Building

5.44 squares 2x10 first floor framing with rough floor and plain red oak finish floor, $49	266.56
3.28 squares 2x10 first floor framing with rough floor and 2¼ face clear yellow pine finish floor, $44	144.32
7.80 squares 2x8 second-story framing with rough floor and 2¼ face clear yellow pine finish floor, $42	327.60
8.72 squares 2x4 ceiling framing, $5.50	57.96
22.50 squares 2x4 outside wall framing with shiplap sheathing, $13	292.50
22.50 squares ½x4-inch siding, $9.50	213.75
13.25 squares 2x6 main roof framing with sheathing and shingles, $23	304.75
.50 square 2x4 bay window roof framing with sheathing and shingles, $23	11.50
1.80 squares 2x4 rear entry and porch roof framing with sheathing and shingles, $23	41.40
144 lineal feet outside base, 20c	28.80
112 lineal feet corner boards, 15c	16.80
128 lineal feet main cornice, 80c	102.40
20 lineal feet dormer cornice, 70c	14.00
38 lineal feet rear entry and porch cornice, 65c	24.70
18 lineal feet bay window cornice, 70c	12.60
2 squares 2x6 partition, $9	18.00
13 squares 2x4 partition, $7	91.00
4 cellar steps to grade line, $2	8.00
8 cellar steps, grade landing to cellar bottom, $1.25	10.00
24 square feet of landing, 60c	14.40
4 steps main stairs to landing, $3.50	14.00
9 steps landing to second floor, $3	27.00
24 square feet landing, 80c	19.20
6 cellar windows complete, 12x16 2 lt., $5	30.00
1 front window 40x40 & 40x16, oak finish	22.00
4 windows 24x28, 21 lts, oak finish, $18	72.00
2 single sash frames 30x20, oak finish, $13	26.00
1 twin sash frame 24x20, oak finish	24.00
1 frame 20x24, 2 lts, pine finish	12.00
1 twin frame 24x24, 2 lts, pine finish	28.00
7 frames 24x24, 2 lts, pine finish, $14	98.00
1 twin sash dormer window	12.00
1 outside door and frame oak finish, 3.0x7.0	47.00

Digitized by Google

1 mirror door 2.8x6.8, oak finish	50.00
2 French doors 2.6x6.8, oak finish	70.00
1 double acting door 2.8x6.8, oak finish	26.00
1 colonnade opening, oak finish	75.00
1 outside rear door, pine finish	20.00
1 grade door 2.8x6.0	20.00
1 inside cellar door 2.6x6.6	6.00
6 inside doors 2.8x6.8, pine finish, $18	108.00
4 inside doors 2.6x6.8, pine finish, $17.50	70.00
2 clothes chute doors 2.0x6.0, $16	32.00
142 feet oak base, 25c	35.50
170 feet oak picture mold, 12c	20.40
350 feet pine base, 15c	52.50
150 feet pine picture mold, 10c	15.00
Clothes chute	7.00
Cupboard case	30.00
Medicine cabinet	12.00
Closet shelves	8.00
Plastering 697 yards, 75c	522.75
Total	$3,884.39



We find the cost of the lumber, millwork, carpenter labor, hardware and plastering to be $3,884.39. The square feet of floor space for both stories figures 1,652 feet. This figures approximately $2.35 per square foot of floor space. Now for a short cut in estimating we could figure as follows on a similar job:

Short-Cut Estimate

Here are figures for a short cut estimate worked on this basis. It is only necessary to figure out a constant price for this type of building.

Excavating, foundation and masonry	$564.80
208 square feet front porch, $1.105	229.84
1,652 square feet first and second floors, $2.35	3,882.20
Plumbing	450.00
Electric wiring	95.00
Gutter and tin work	70.00
Painting	225.00
Heating, furnace	300.00
Incidentals, 5% of the above	290.84
Total estimate	$6,107.68

THE following are figures just issued by the Department of Commerce, showing the percentage which the amount paid to each labor group bears to the total labor cost of a six-room house:

TOTAL LABOR COST 100%

Trade	Frame house	Brick house
Carpenters	49.6	32.2
Bricklayers	6.2	21.5
Hod carriers	2.2	6.7
Plasterers	7.9	8.8
Plumbers	8.7	7.6
Electricians	2.6	2.5
Painters	10.0	6.3
Common laborers	6.3	9.9
All others	6.5	4.5
Total	100.0	100.0

These averages were constructed from reports covering a large number of six-room brick and frame houses throughout the country.

The relation of the amount paid to the various groups to the total labor cost varies according to the types of construction prevailing in the various localities; these are fair averages.

CARPENTRY

Good Practice in Frame Construction and Finish

Raising a Roof

How a Ticklish Repair Job was Successfully Undertaken

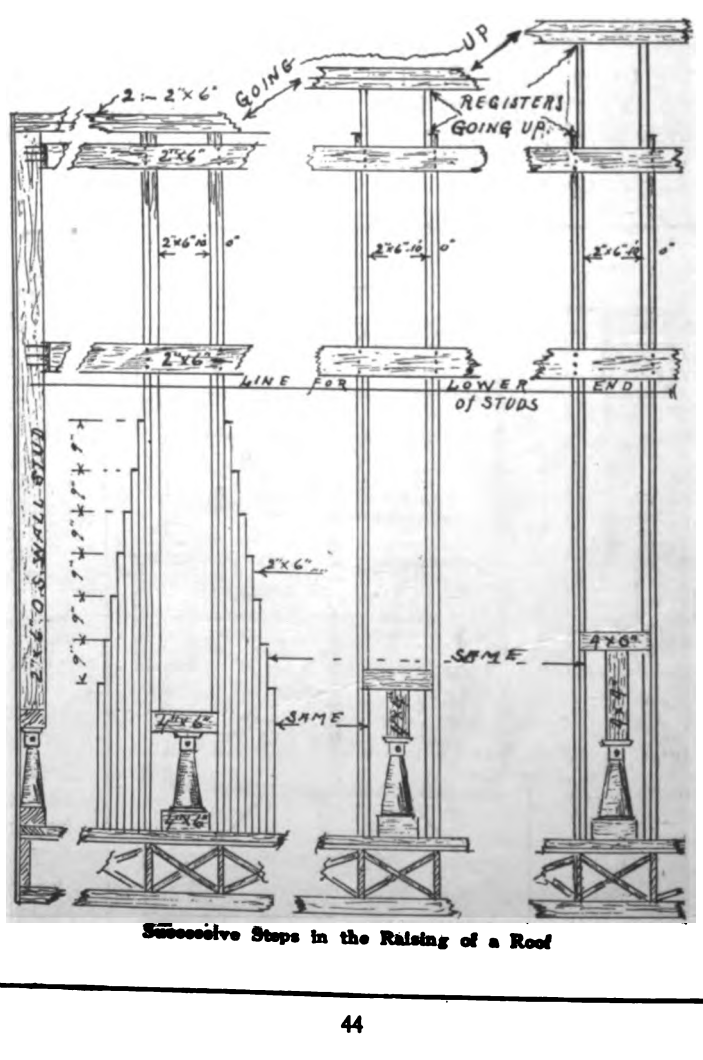
By C. A. DONER

IT is frequently desirable to raise the roof of a building intact but the difficulty of doing it often decides that the roof be taken apart or the job not done. Since few buildings can spare their roof long enough for new walls to be built and a new roof put over, the job isn't done.

Such a job went a-begging here last season for takers. The prospect was an armory, a frame structure 50′-0″x150′-0″x12′-0″. Light frame wooden truss spanning the whole width and with a ceiling of ⅝″ beaded stuff in fair shape. Side walls were covered with wall board, badly broken. Required: Raise roof to ceiling height of 18′-0″, not forgetting what rain will do to a polished maple floor!

All walls were stripped of wall board and the 2″x6″ studding made free of nails or other obstructions on both sides and inside edge. Splice studding was cut to uniform lengths of 10 feet, set in place and toenailed to plate, otherwise free to go up with plate and roof.

A line was drawn at the proper height along the permanent studs so when the lower ends of splice studs were raised to be even with this line, the ceiling would be the proper height and plate straight with the line.



To prevent the roof and side walls from swaying sideways when the roof was lifted off the studs, 2″x6″ timbers were spiked to permanent studs; this put the splice studs in a pocket in which they could slide up but not sway sideways. Further precautions for safety were provided in the way of ¾″ manila lines.

When all material was cut and distributed and all jacks set, nine men with forty 16″ jacks of 9″ lifts had raised the roof and were spiking the splice studs into the permanent studs at the end of seven hours.

An outside scaffold being built in advance, the job was nicely inclosed from rain the second day.

Perhaps the accompanying drawings can best describe the remaining details and particulars.

When jacks had raised 9″ the 4 x 6″ blocks were supported by studs at that height, then jack was lowered and next height upright inserted and next raise made, etc.

Successive Steps in the Raising of a Roof

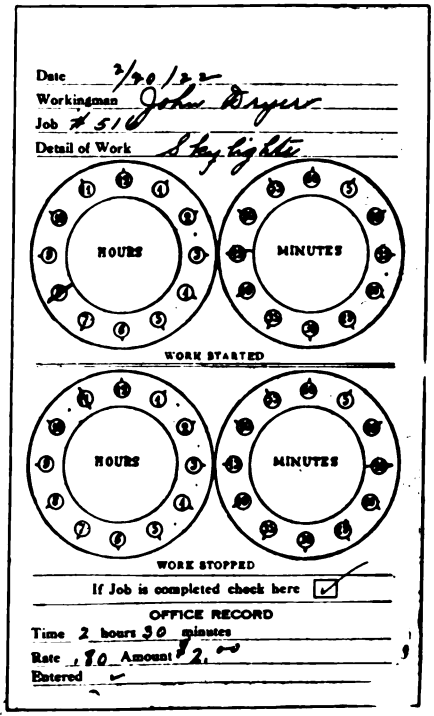
WHAT'S NEW

New Materials and Equipment that Keep Your Work Up to Date

Fireproof Sheathing

FRAME buildings, as shown in our illustration, may be covered with a fire resisting material known as "Porete," this is manufactured in slab form of Portland cement and sand, reinforced with galvanized iron netting.



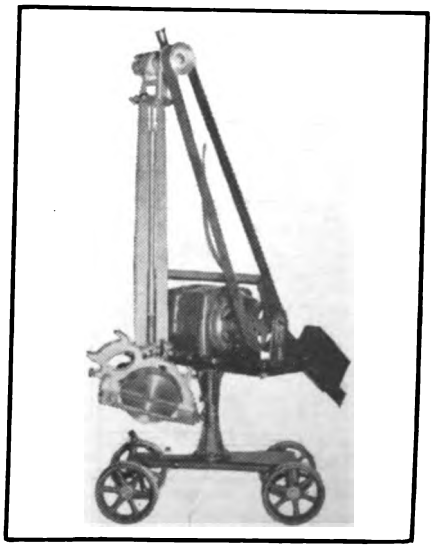
For stucco buildings they are economical to use as the ordinary wood sheathing and metal lath are not required; the stucco being applied directly to the slabs, and as they are practically slabs of re-inforced concrete, a perfect bond is assured.

Besides using the slab for sheathing the sides of a house they are also useful for covering roofs, both sloping and flat. Another economical use for the slabs is for closing the space underneath porches or the small house that is built only on piers.

These concrete slabs are manufactured by the Porete Mfg. Co., 26 Verona Ave., Newark, N. J.

Control of Labor Cost

THE control of labor time and cost are factors which require close attention. These factors may be "estimated" but cannot be pre-determined exactly. Still the final result in carrying through a job profitably depends to a large extent on labor cost. Change of operating methods during progress of a job, or the change of workers, or the change of tools, or machines may be instrumental in turning a losing proposition into a profitable one. In order to accomplish this, the management should be constantly, correctly informed of the labor cost during progress of a job. This is accomplished by use of "Job Labor Tickets."



While there are many good job labor tickets in use, very few comply with all requirements.

These "Clock-Face Time Tickets" are distributed by the Arrow Book Company of 347 Fifth Avenue, New York City, where free samples, prices, etc., may be obtained upon request.

Carpentering Machine

HERE is a small machine called "Flexway" that will effectively do practically all hand operations in woodworking. Stock up to 2 inches in thickness can be cut off, ripped, jointed, routed, grooved or bored, etc.

It is installed on a carpenters bench or may be used on the floor. On the bench it can be easily moved from end to end on tracks; for floor use, rubber tired wheels and a pull handle are supplied. Its extreme flexibility enables it to be used at any angle desired. Flexway is manufactured by the P. L. Billingsley Co., 427 Elm St., Cincinnati, O.

Construction Elevators

How to Design and Erect Elevators for Hoisting Building Materials

By LAWRENCE S KEIR

HOISTING building material on a job is economically and safely done by using a builder's elevator of simple construction like that shown here. The detail drawing given on this page represents the elevator as it would be set up inside the building under construction, using the future elevator well, the stair well or a temporary opening up through the building as a hoisting well.

The members *a a* rest on top of the floor or floor timbers at each story. They should be fastened securely and well braced. When the head piece *b b* is above the top floor special care should be taken to brace it. As will be seen the elevator is constructed of simple materials that can easily be secured at short notice.

Any size pulley wheels and rope may be used, provided they are strong enough for the work required of them, but better results will always be had with wheels of ample size; do not use pulleys less than eight inches in diameter.

The cars shown are six feet by six feet floor size which is a convenient size for two wheelbarrows side by side. Elevators of this kind may be erected singly or in pairs and so rigged as to run independently or they may be arranged to work together, one going down as the other is being hoisted up. The available hoisting power and the use to which the elevators are to be put determine this point.

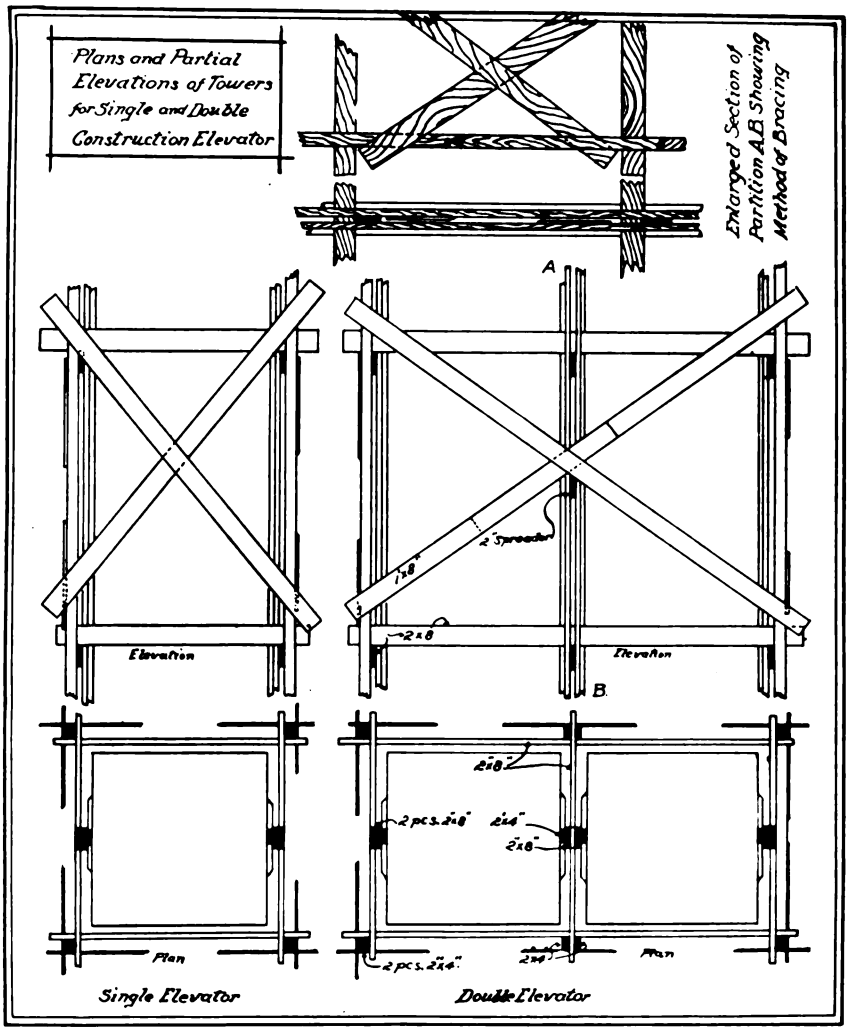
The head piece is so arranged that it can be easily removed and the guide tracks spliced out from story to story as needed. A little forethought in splicing the two 2x8 pieces and the 2x4 piece that forms the guides will make it possible to have a long lap each time the guides are lengthened out.

The other drawings show how the elevators may be arranged either singly or doubly in a frame tower erected outside the building. These towers must be well braced and either

Digitized by Google

Heavy Steel Beam Being Moved in Position to Hoist in Outside Elevator Shaft

guyed or fastened to the building in some way.



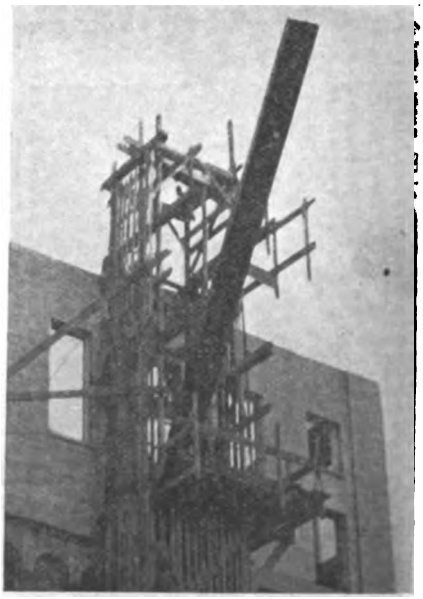
An elevator of this kind is sometimes used to hoist concrete to a raised platform from which the concrete is then dumped into chutes and deposited it where required.

The cars should be carefully made and the irons bolted on. They could be made during slack times, as they cost but little and are a good addition to the builder's equipment. Then when they are needed there will be no delay in getting them on the building job.

The towers and guides or tracks must necessarily be erected on the job and may be spiked or bolted together. In any case it is well to bolt the head piece into place as it is then easier to remove it to lengthen out the tracks. Sometimes the guides may be cut off so that the head piece, together with a length of each guide, can be hoisted as high as wanted and then the guides spliced out to the required height. This saves moving the head piece, which is worth considering if it should be spiked fast.

A reasonable amount of clearance between car and tracks, with straight smooth tracks, and plenty of grease make for smooth, easy running. Always provide ample platform space and good guard rails. Dry battery warning bells connecting elevator and hoisting engine are easily and cheaply installed. Don't let everybody and anybody use the elevators. Safety first and always should be one's slogan.

A good plan is to screen in the elevator shaft entirely to protect those "boobs," who can only find out where



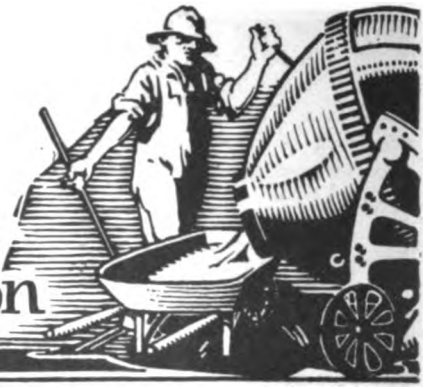
the car is, by putting their heads into the shaft!

The two pictures show an interesting example of an outside elevator shaft which was erected for the raising of materials for an addition on top of the stage of the Metropolitan Opera House in New York.

This outside elevator shaft was used for the hoisting of some of the large steel beams necessary for the construction work. Ordinarily a derrick would be needed for this work.

The beams were slung and hoisted vertically through the shaft, then swung out at an angle so as to permit slipping the lower end of the girder through a window in the brick wall.

The operation of hoisting these beams caused a considerable amount of interest and a large crowd always gathered to watch the work. The contractor on this interesting alteration job was Perry Reed, of New York.



How the Steel Beam Was Successfully Raised to Top of Shaft Ready to Be Lowered Through Window

CONCRETE

Form Work-Reinforcing Methods Monolithic and Block Construction

Avoiding Concrete Failures

A Few Practical Points on Obtaining a Successful Sidewalk Job

By DALE VAN HORN

TODAY, with good cement on the market and its use past the experimental stage, what is to account for the large number of concrete sidewalk jobs which fail? Almost invariably, it can be traced to one or more of three or four things. If done in freezing weather there may have been lack of necessary precaution to guard against the damaging Jack Frost. Again, it might have been due to dirty aggregates, imperfect bonding, improperly constructed bases and foundations, or again the joints may have been hastily cut and failed to extend through all of the concrete. In other words, any one omission of several necessary steps in the construction of sidewalks will result in total or partial failure and eventual repair work. Good materials, proper methods carried out and careful workmanship are necessary qualifications for the construction of sound and lasting walks.

Aggregates selected should be inspected closely and only those presenting a hard and flinty surface should be used. The reason why pit sand and gravel fail to make good is because many of the particles have a fine coating of clay or dirt on their surfaces. This keeps the cement mortar from bonding with their surfaces and thus leave voids, later to become filled with water, and, when freezing weather approaches, the two split apart. Materials which show foreign matter clinging to them should be avoided, or thoroughly washed.

In the Middle West a common practice is to use sand and gravel entirely. These materials are all right for the top coat, but cement can be saved and a stronger bed obtained, if hard crushed rock is used in this step. Gravel or even sand does well for the top. It is to be understood that gravel is not to be omitted from the base, but that stone is to be used with it.

The foundation should be so constructed that it will not settle, but remain firmly rigid and at the same time offer a natural drainage for any water which might collect under it. In some localities, it is even necessary to provide artificial drainage where the soil is heavy and low. In this case, tile drainage lines are run at the outside of the walk to some natural outlet. Fills which have been improperly constructed and poor subbases are the cause of a lot of inferior walks.

One of the common results of a poor foundation is a crack which runs, often through the center of the walk for a considerable distance. This fact alone may not make it necessary to rebuild the walk. But weather changes, the action of freezing usually expand minute cracks to a width of an inch or more and the wider they become, the more chance the elements have to work. In time earth lodges there and soon a narrow ribbon of grass or weeds divide the walk. But worst of all, it will be only a matter of time until the whole will be in such a state that replacement becomes necessary.

Such Work Is Inexcusable Here—Had the Walk Been Located on a Less Pretentious Spot, the Poor Workmanship Might Have Been Accounted For—On a State Campus Within Stone's Throw of Fine Buildings, This Walk Keenly Reflects Against the Institution

Here the Cracks Have Started the Walk to Crumbling, and, Aided by Frost, Has Wrought Havoc With What Should Have Been a Lasting Job—Imperfect Bonding of the Surface and the Body and Unclean Materials, or Possibly a Poor Grade of Cement, Might Account For the Damage

Digitized by Google

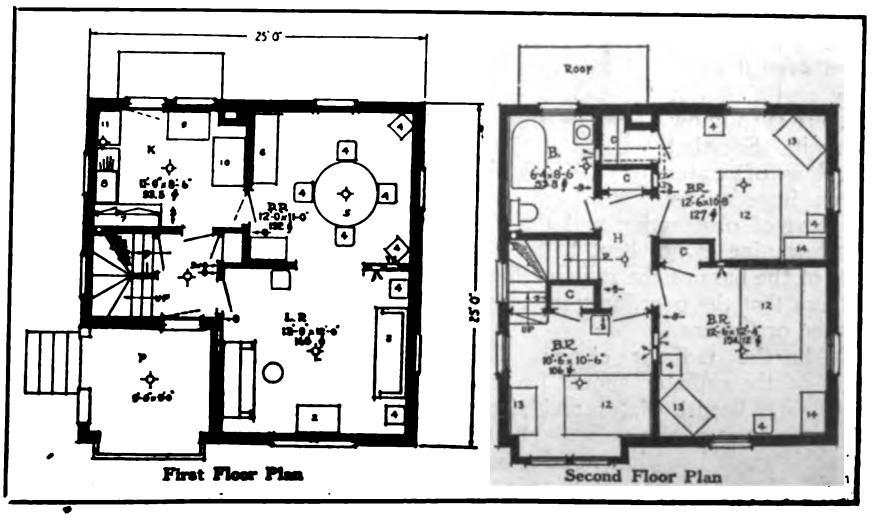
In laying the walk the wood spreaders should be replaced every seventy-five feet or so with a thin metal strip of the same size or even a wood lath of one half inch thickness. When the walk has been finished, this strip is removed and the space filled with asphalt or tar, thus forming a natural expansion joint. Unless this precaution is taken there is imminent danger of heaving where two cakes are forced upward, due to the end pressure.

A wood float or wood trowel is the best tool with which to finish the top. The steel trowel is popular, but nevertheless, it leaves a surface easily made slippery and very often fine hairline cracks occur, not unlike incipient cracks. These fine cracks occur because the steel trowel leaves a film of pure cement which contracts upon hardening and drying.

If the top is to be laid after the base has hardened considerable care should be exercised in applying it. Water under pressure from a hose should be played on the surface until all free and foreign matter has been washed away. Then a creamy mixture of cement and water is applied and worked in. To this may then be applied the top.

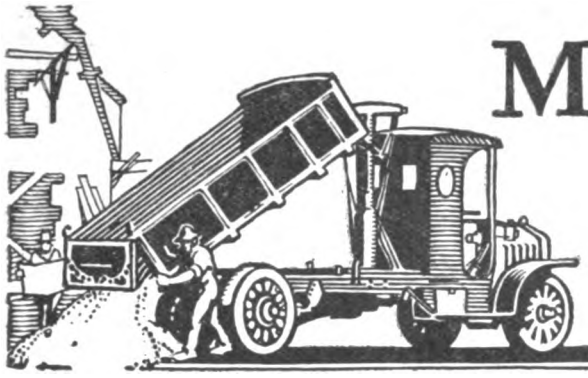
Trees which are to be surrounded with concrete should be given at least six inches on all sides. The space within can be filled with sand.

100 Concrete Houses



Interesting Housing Development at Johnstown. Pa of the Cambria Steel Co.

MODERATE cost houses of concrete are no innovation but when one hundred of them are built by one company it makes one stop and investigate the merits of the system used in their construction.



The houses vary in design, a number of plans having been worked out so that no two identical houses are located in the same vicinity. Various kinds of pebbles and shells have been used in the finish of the stucco, and the paint used on the trim is of various colors so as to give a pleasing color scheme.

Particular attention has been given to the room arrangement so that furniture will fit to the best advantage. The plans presented herewith are typical of all the houses, some however, have only five rooms.

These houses have hollow concrete walls made by using the Van Guilder double wall system, at a considerable saving over other forms of building.

MOTOR TRUCKS
Efficient Methods in their Use and Upkeep

Is Your Motor Truck Ready?

Little Things Examined and Repaired Now Will Ensure Service in the Busy Season

ALTHOUGH it is only March now it is well to remember that the sweltering days of summer will soon be with us and service stations will again be filled with heat-afflicted motor trucks. Will your truck be in the steaming-radiator line? Or is it prepared to give uninterrupted service during the summer, just when you need it on construction jobs?

Overheating and other common hot weather troubles are usually due to lack of forethought and to mistakes that can be easily avoided. The main points which require attention are briefly outlined below by A. F. Masury, Chief Engineer of the International Motor Co.

1—Do you understand the truck's cooling system thoroughly. If not, now is the time to go over it carefully and find out all there is to know about it. See that the flow of water is not impeded by any sort of obstruction and that the overflow pipe is not bent below the level of the base of the radiator filler. Be sure that the overflow pipe is not clogged or flattened.

2—Is the radiator clean? The front of the radiator should be free from dirt, license plates and signs. Also, the back of the radiator should be unobstructed so that nothing will impede the circulation of the air.

3—Are the hose connections water tight and is the hose in good condition? Be sure that the rubber has not been affected during the winter by an anti-freeze solution. Only the best quality rubber hose should be used, as the inside tubing of cheap hose is easily worn away and the rubber particles carried along with the water clog up the radiator.

Motor Trucks Deliver the Material on Time

4—Does the fan turn freely and is the belt tension right? The fan should be clean and its bearings should be well greased. A good test is to turn the fan by hand with the engine shut off. If it is possible to slip the belt easily, but not possible to spin the fan, the tension is right.

5—Is the carburetor choke in proper repair so that it opens all the way? Better open the seasonal shutter on the hot-air tube. Is the float level correct? If too high, slight flooding will cause an over-rich mixture.

6—Does the ignition system furnish a spark of sufficient strength? A weak spark due to excessive lubrication of the magneto, dirty breaker or distributor, or weak magnets, will have an affect similar to late spark timing and overheating will result.

7—Are the valve tappets properly adjusted? They should have from .008 to .010 inch clearance, which may be gauged by about the thickness of an ordinary post-card.

8—Are the cylinders free from carbon? If not, remove it.

9—Is the oil in the crankcase clean? Gasoline, dirt, or other foreign substances will impair the quality of the oil in the crankcase resulting in overheated parts due to insufficient lubrication. The oil reservoir should be drained every 1,500 miles, the walls thoroughly cleaned, and a fresh supply of oil should then be put into the crankcase.

10—Are you using the right grade of oil? Because of the increased temperatures it is often advisable in summer to use a heavy grade of oil.

11—Are the exhaust pipe and muffler clean?

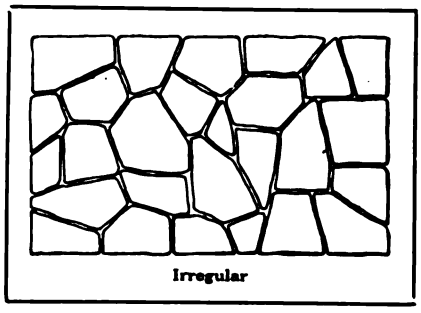
MASONRY
Practical Information on Materials and Latest Construction Methods

Garden Walks

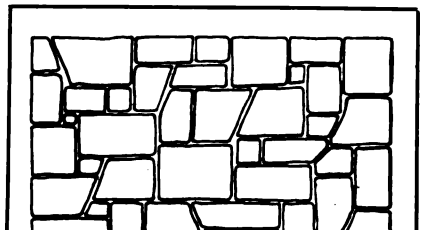
How to Lay a Stone Path for Beauty and Service



By H. ROGERS

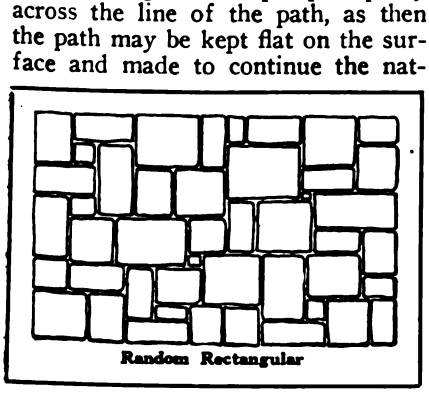
STONE for paths and terraces is growing in favor with quite a number of home owners and therefore the builder is often called upon to construct such a walk and to aid him in this work the following remarks may be appreciated:

To make a good job the walk should have a proper foundation; a trench eight inches or more in depth should be made and filled in with some refuse material that will allow of quick drainage, broken stone or cinders are good but, if the building has just been completed, there will be more or less broken pieces of brick and stone lying around for removal; these can be buried for the path foundations at a saving at both ends, it gets rid of the rubbish and no material has to be purchased.



A stretched cord is the best means of keeping the lines of the path straight; for curved paths the radius is described with a cord fastened to a stake as a center.

If the garden is level it is best to give the path a slight camber to throw off the rain water but this is unnecessary if the ground slopes perceptibly across the line of the path, as then the path may be kept flat on the surface and made to continue the natural slope of the ground. To get the path level one should use a large straightedge; this is preferable to a cord which is likely to sag.

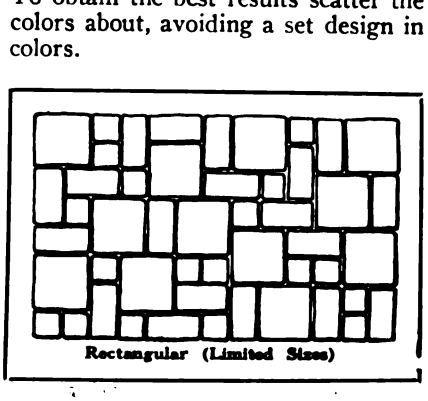


Irregular

Little did England's old gardeners and our own Colonial forebears appreciate the beauty of their winding grass framed walks, made of stepping stones. There is a delightful absence of artificialness about such a path and that is the reason, perhaps, why they are being better appreciated by the people of today.

Semi-Irregular

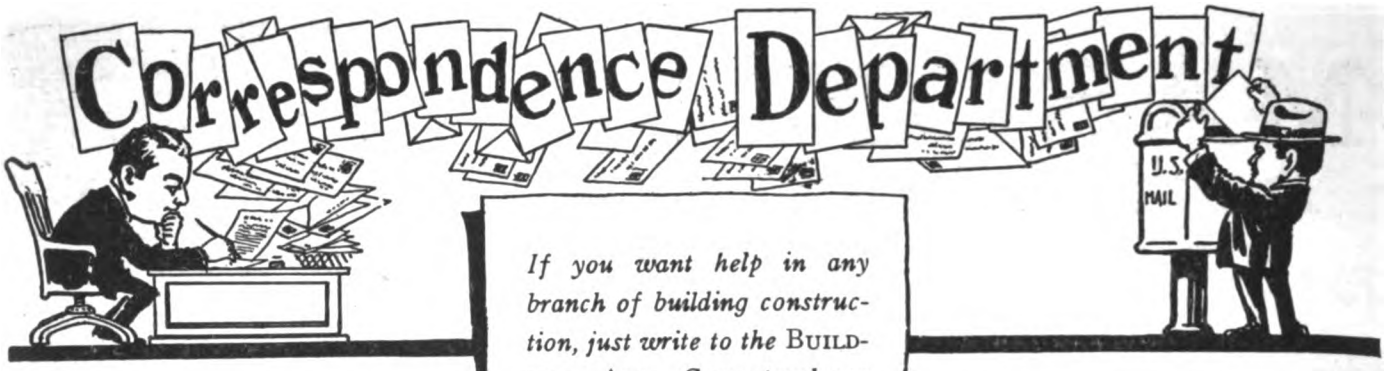
In localities where stone abounds the cost is but little for material. In other places it pays to buy the stone and have it shipped so as to get the delightful effects. Slate is now being used for this purpose to quite an extent.



Random Rectangular

The stones should be worked into more or less regular shapes, no sharp angles being allowed and when laid their edges should not be in close contact, the spaces between are filled with cement mortar or, where preferred, dirt in which the grass is allowed to grow. Today the very grass which our ancestors railed about for growing between the random stone-laid terraces and paths is highly appreciated.

Where the stones can be had of nearly equal thickness throughout—as is the case where blue stone or slate is used—they may be simply laid flat upon the foundation and grouted with liquid cement. Where the stones vary much in thickness it is better to build them together like rubble work.



Whenever possible secure stones of different colors for the same piece of work as when rightfully handled a very artistic mosaic-like result can be obtained.

The illustrations on this page will give a few ideas of how the stones may be laid to obtain good effects. To obtain the best results scatter the colors about, avoiding a set design in colors.

Rectangular (Limited Sizes)

Novel Truss Design

HERE is a sketch of a roof truss that I designed and built over five years ago. The truss is still in the same condition today as when I left it. The camber has not deflected in the chord ¼ of an inch. The building was erected for a factory and the idea was to use only short lengths of yellow pine timbers. The building was 190 feet long with a span of 45 feet.

As the enlarged section shows, the rafter was cut in two pieces and gained into the strut and secured by a bolt with additional pieces of timber nailed over the outsides.

The principal dimensions were as follows:

8 x 10 inch chord.
8 x 10 inch rafters.
8 x 10 inch struts.
8 x 10 inch purlins.

In calculating the stresses a dead and live load of 50 pounds per square foot was allowed for. The trusses are spaced 16 feet from center to center. The purlins are covered with one inch sheathing and these are covered with 3 ply roofing. In the enlarged section it will be noticed that the thrust of C B equals the thrust of B D. The thrust of E B is transmitted to D.

A reaction of ten tons has been figured on the walls for each side of the truss. The pitch was one-quarter.

The following formula was used in all the calculations:

Base multiplied by depth squared, multiplied by 100 divided by span in feet equals safe load.

On account of the truss being made up of short pieces, the cost is not as great and time can be saved in raising the truss.

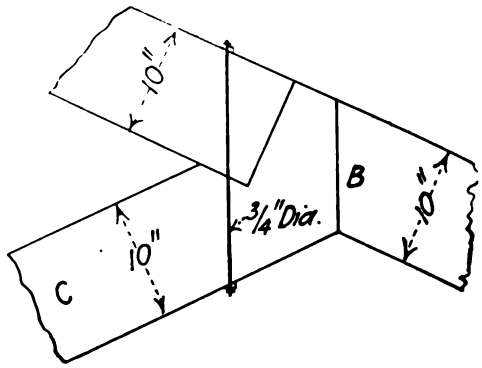
I was carpenter foreman when I designed it and I trust it will be of interest and help to my fellow readers.—**Wm. H. Malseed.**

HAVE you ever used any machinery or device which has saved you time and money?

Have you ever invented any way of doing a piece of work quicker?

If you have BUILDING AGE wants your experience, and will pay regular space rate for it.

Your description should tell just how you saved time and money, either by a special way of using machinery or by short cuts in construction. Point out what methods you were using before adopting your "Time Saver" and show how your new method turns the trick. You can submit as many articles as you want.



Address The Editor, BUILDING AGE, 920 Broadway, New York City.

How to Construct a Good Chimney

KINDLY tell me how to construct a good chimney that will draw well.—**E. K. L., Seattle, Wash.**

Information and data on chimney construction may be obtained from the various brick associations and also from the National Board of Fire Underwriters. The points to be observed are briefly discussed as follows:

In planning chimneys the points to be considered are the number and size, the height and the arrangement of the flues. Attention must also be given to the location in respect to valleys on the roof, the immediate neighborhood of walls, hills or trees, as these factors tend to create at times strong eddies and cross currents which interfere with the draft.

In order to make the chimney draw properly a separate flue should be provided for each fireplace, the flue to extend to the top of the chimney.

For ordinary stoves and small furnaces the flues may be 8 x 8 in. in cross section, but if the furnace is large it is better to have a flue 8 x 12 in. and the same size should be used when possible for fireplaces having large grates.

If slight bends occur in the construction the cross sectional area at these parts should be the same as in the straight part and be made round in shape as this shape eliminates the frictional resistance more than a square flue.

If a room is kept practically air tight by using weather strips on the doors

Digitized by Google

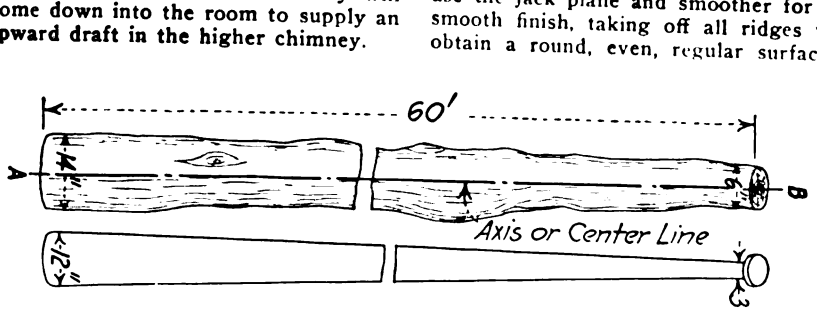
and other draft preventives the chimney is liable to smoke; also when there are two chimneys one higher than the other in adjacent rooms and the doors and windows are closed in the house the draft in the shorter chimney will come down into the room to supply an upward draft in the higher chimney.

Flues should also be lined with some fireproof material and the building laws in many large cities require this to be done.

Tile flue lining makes a decidedly efficient tight chimney and absorbs less heat than a brick chimney. Sometimes galvanized iron pipe is used, and if the pipe is round the space between it and the walls of the chimney may be utilized for ventilation.

If flue linings are not used the outer walls of the chimney flues should be 8 in. thick.

Chimneys should be constructed of the best hard brick and cement mortar and all joints should be properly filled.



A chimney should be kept well cleaned for the reason that a sooty chimney not only interferes with the draft but also tends to cause lightning to strike it.

In order to prevent a downpour of rain from entering the chimney and smothering the fire, the top of the chimney is frequently covered with a stone slab or cap, the smoke passing out through openings at the sides near the top.

Shaping Taper Posts and Poles

IN order to properly shape a taper pole or post from a tree, peel off the bark with a draw knife or broad chisel, then find, on the top and bottom ends, the center of the ends, which we will assume are sawed about square to the axis line A B, which is struck with a chalk line stretched, as indicated in the cut from a diameter marked across each end. There should be two of these square to each other so as to form a cross.

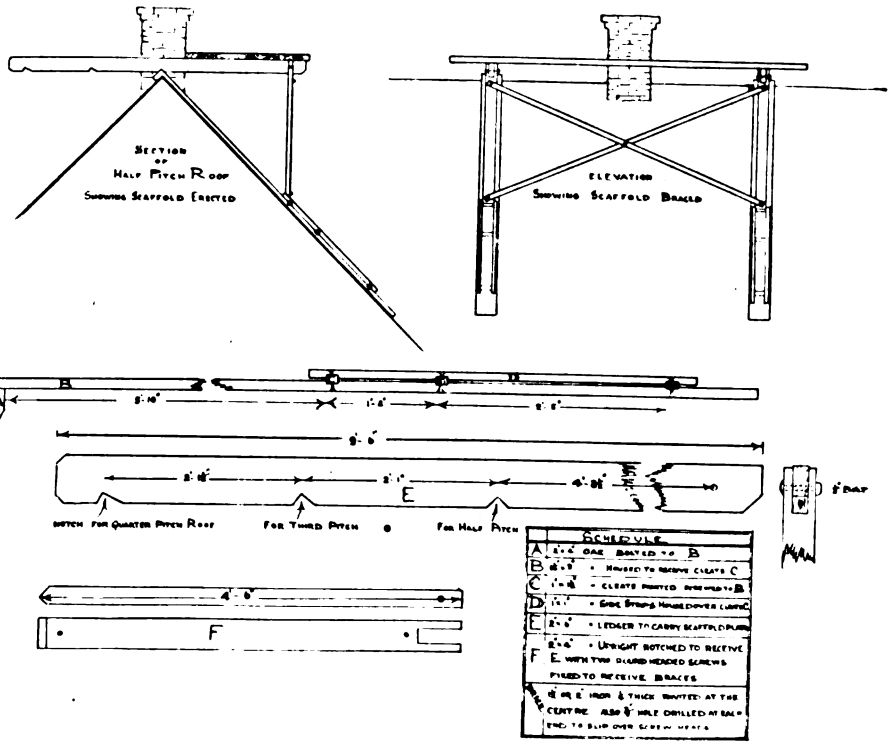
Hew off each side to the outline desired either straight or curved, hewing each side straight and square to the right or in other words "square the pole." Next make it of octagonal or eight-sided section, and finally round. All this may be done with the adze, hatchet and draw knife, using the eyes for judging outline and shape. Finally use the jack plane and smoother for a smooth finish, taking off all ridges to obtain a round, even, regular surface.

All this takes time and patience. The tree or the pole should rest on four or more horses at a good convenient height for planing, etc., and be turned with cant hooks at the bottom end, which is to go into the ground or concrete.

Flag or clothes poles are generally set one-tenth of the length in the ground and it is best to have their bottom covered ends coated with creosote or tar before embedded in concrete which is filled into the holes after they are erected and plumbed, which is best done by sighting them with an adjacent plumb object such as the outer angle or corner of a building. Of course a plumb bob and line held high up on the stick may be employed to verify the setting.—**Owen B. Maginnis.**

The Quality Roof Scaffold

HOW often in the past has the contractor been called upon to either renew, repaint or re-top a chimney, where the discouraging part of the whole business has been the item of erecting a scaffold, whereby the mason might have the necessary foot room for the successful completion of the work.



There is also the hazardous nature of the work, connected with the erection of such a scaffold, which requires skilled labor, but this is not always available when most needed, thus making the scaffold item of expense sometimes more than the cost of the chimney repair itself.

This is the time of the year when many building contractors throughout the northern states have the time to consider any labor-saving device that will help them in their business.

Now the "Utility Roof Scaffold," as I call it, is described herewith by sketches and details that are self-explanatory. It can be made by any shop or mill carpenter (with the exception of the iron brace) and in one season will probably pay for itself many times over.

If given two coats of paint and a place is made for the different members when not in use, it will last for years.

It is a device that I designed and made, while I was shop foreman for a contracting firm of this city, who found it both practical and economical, doing away entirely with the carpenter labor, that is always necessary, and substituting unskilled labor.—**Joshua Thompson.**

FINANCE and REAL ESTATE

Helpful Data for the Builder Who Builds to Sell

Financing Home Construction

Interesting Methods Used to Promote Home Building in the South

WRITING to the editor, Robert Jemison, Jr., President of Jemison and Co., investment bankers, of Birmingham, Ala., says:

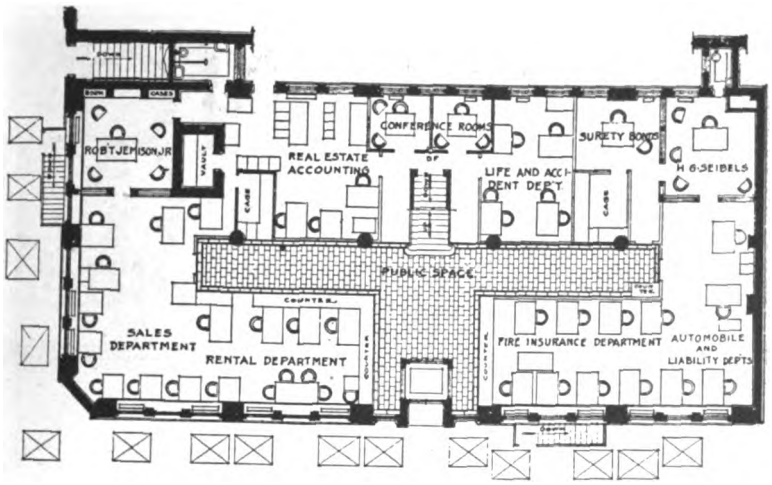
"As one of your subscribers, it occurred to us that you might be interested in our new office building, which we believe to be more or less unique and distinctive and it is perhaps one of the largest and best equipped buildings in the country occupied exclusively by firms engaged in the business of real estate, insurance and mortgage loans."

This building is a reflection of the sound conditions of the building and real estate interests in the South at the present time.

With the past year surpassing 1920 by more than $2,000,000 in the cost of building construction, Birmingham is starting the year 1922 with splendid prospects of eclipsing that and all former records.

This applies alike to residential, business and municipal construction. Municipal authorities announce that the year will witness the construction of an auditorium to seat from 7,500 to 10,000 people, for which bonds have been voted, and that construction of a new city hall, market and library is also contemplated for the year. These four structures may be combined in one building to cover an entire city block, if plans now considered are finally adopted, the cost of the construction to reach about $2,000,000.

TO MORTGAGE BANKERS AND TRUST COMPANIES:
"We and you have a responsibility to fulfill to the people who need help to house themselves."—Walter Stabler, Comptroller, Metropolitan Life Insurance Company.



County authorities are also contemplating a new court house to cost upwards of $1,000,000. Numerous business blocks are being planned, and the outlook is that the 1921 record of residences, when more than 5,000 were constructed, will be distanced. Birmingham early in 1921 began showing sister southern cities that it is a real home loving and home building city.

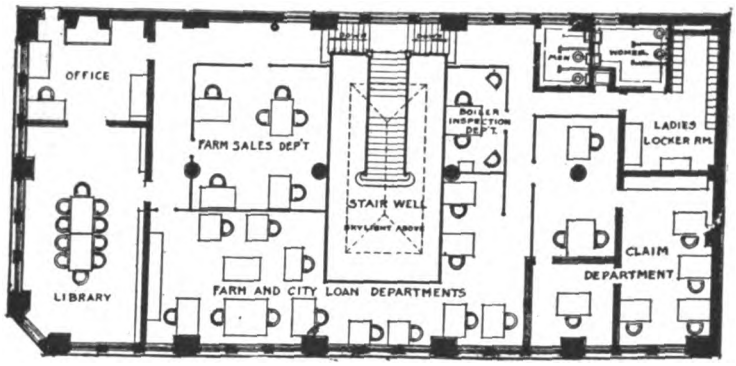
"With the beginning of the new year one building and loan association here found it necessary to increase its stock by $1,000,000, following an increase of $2,000,000 during last year. All this capital is invested in Birmingham buildings. The real estate firm of Jemison & Company, one of the largest in the South, assisted largely in the building program of the city, making loans of over $2,000,000 on Birmingham residential property and Alabama farms during the year for the Metropolitan Life Insurance Company, the mortgage department of which they represent in Alabama as state agents. The Jemison Company are preparing for a more active year in 1922 than it enjoyed in 1921 and is offering a very attractive plan for making fifteen-year loans on an easy payment plan on new homes and apartments, projected by the Metropolitan Life Insurance Company.

"We are very fortunate in representing the Metropolitan Life Insurance Company when there is such strong demand in Alabama for money with which to build homes and improve farms.

Digitized by Google

Ground Floor Plan

This connection enables us to make fifteen-year loans on homes on a successful easy payment plan, and we have been able to assist many persons of limited means to own their homes and obtain relief from the rental burden. We have also encouraged the construction of apartment houses and the erection of numerous needed business blocks. As our easy payment plan is better known it will become more popular and we expect a large increased business for the present year over the past."



The optimism is also reflected through other real estate and building material firms of the city. The new year started with many of the large iron and steel industries of the city and district resuming operations, and these resumptions have naturally made the building outlook loom brighter for the year to come.

The essential points of the Metropolitan Life Insurance Company's loan plan are as follows:

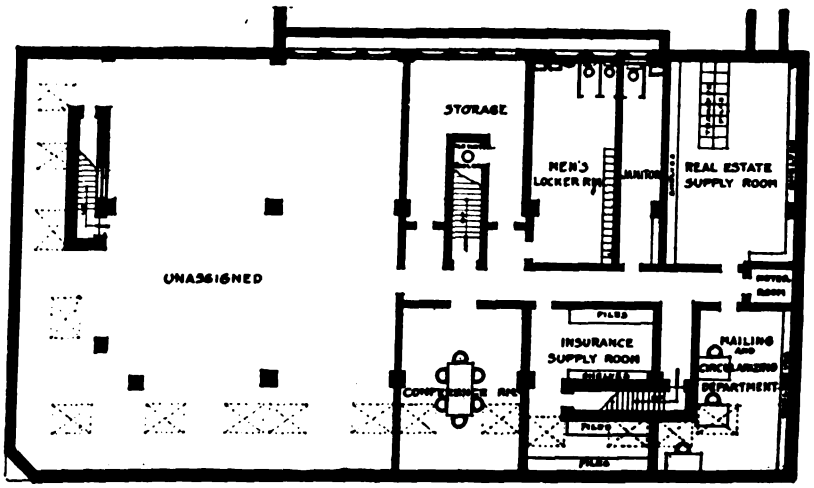
Loans are made up to one-half the value of the property. Thus a house costing $5,000, built on property worth $1,000, the maximum amount of the loan would be $3,000.

Payments on the loan are made semi-annually, the interest is at the rate of 6½%, the payment on the loan is 3% of the principal plus the interest semi-annually. At this rate the term of the loan is for fifteen years, this brings down the average cost to the borrower to $8.60 per month per $1,000.

In connection with this statement of Mr. Jemison's we present herewith a description of the new commercial building of Jemison & Company. The plans show the arrangement of the office. Each desk has been located with a view of the work to be done and it will serve as a model in planning office layout which is a problem frequently put up to builders and architects.

Second Floor Plan

The building as it stands today consists of two stories and a basement, but the foundations are adequate for a structure of ten stories, an assurance that they will keep pace with the growth of Birmingham.



It stands on a lot 50x100, one of the most prominent corners of Birmingham. Messrs. Warren & Knight of Birmingham were the architects.

The construction is reinforced concrete. The exterior is Indiana limestone; the interior is caen stone, Tennessee marble and mahogany. The furniture and fixtures are in harmony with the dignity of their environment.

A "thing of beauty is a joy forever," in the business world as in the domain of art.

In designing the building particular attention was paid to arranging the space for the different employees so that their work in connection with other departments could be most conveniently done.

From the vestibule one enters the public space which has a block marble floor. Directly ahead is the staircase to the second floor which is of marble supported on cast iron stringers. The hand rails are of polished brass supported on ornamental balusters; this rail continues all around the large open well on the second floor. This well practically makes the second floor a mezzanine to the first floor, and the office is in one unit instead of being scattered on two floors, a very desirable feature.

Basement Plan

PAINTING

Practical Points of Interest to the Builder

The Shingle Roof

By A. ASHMUN KELLY

IS the good old shingle roof doomed? Are the imitation shingles taking the place of the real wooden shingles? To a large extent this is just what is happening. Gradually the various widely advertised asphalt and metal shingles are superseding the cedar and redwood shingles. It is a large subject, and cannot be covered in a restricted magazine article. But it may be that a few words on the subject will interest those who have to do with roofs and roofing materials.

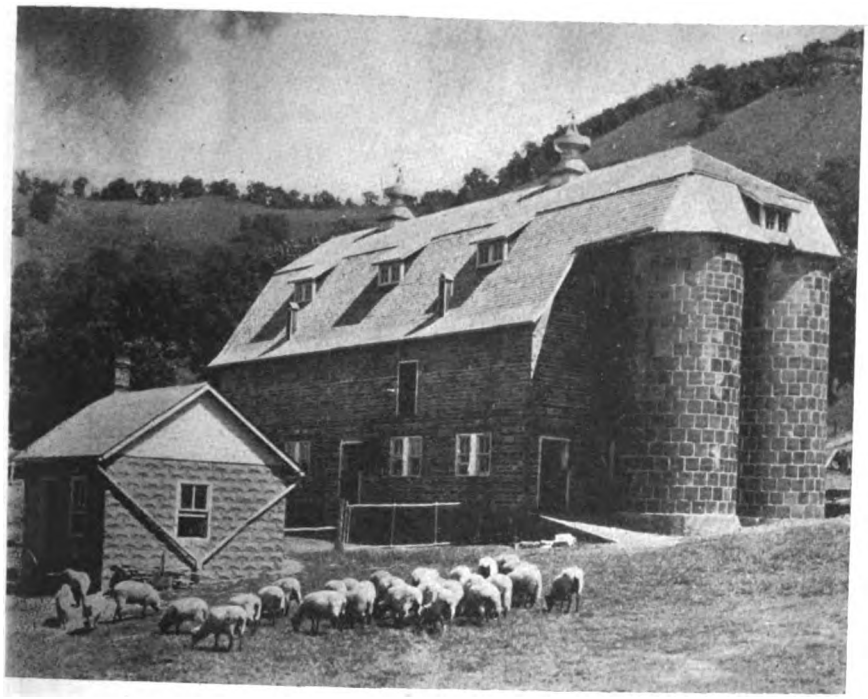
Wooden roofs have the disadvantage of not being fireproof. But they can easily and cheaply be made so. Any coating or stain that will prevent combustion from a cinder or small spark long enough to prevent a flame will do. Even so simple a thing as lime water will do. But the best way is to dip in a good stain. for this will not only render the wood fireproof, but it will also prevent rot, and extend the life of the roof many years.

Creosote stain is the ideal one for shingles. And the shingles should be dipt two-thirds their length. This insures a perfect coating for all parts that will be exposed. Then a brush coat of the stain after the shingles are laid will be a great help, though it is not essential to effective work.

Creosote stain makes it rather costly shingling. But it will pay the client who has it done. One gallon will give two coats of stain to 100 square feet of shingles. When dipt two-thirds their length, 2½ to 3 gallons of stain will coat one thousand 4x16-inch shingles.

Shingles should be perfectly dry before staining, but I have had perfectly good results where I have dip-stained shingles that were not dry, and where I had to throw them into a pile with some rain falling; and placed on the roof before the stain was dry. But this is not advised if it can be avoided. The idea is, that when the shingle is dry it will take up more stain. As the stain is oily the water does not have any effect, unless under the stain. That is why the wood should be dry.

A HIGH-GRADE creosote stain may be cheapened by adding three gallons of water-white 150 deg. test oil, and one gallon of Japan drier to each three gallons of creosote liquid. Crude oil, and the other petroleum or mineral oils do not unite readily with creosote oil, although such liquids are used for the purpose of doping creosote stain. Such doping is not advised as it ruins the creosote as a stain, but painters do sometimes resort to the practise instead of getting a better price for their work. And when it is necessary to thin out creosote stain it is better to use raw linseed oil for shingles, and turpentine for inside staining. Such thinning is not often needed as the stain is right when bought, though by not keeping it well stirred while dipping the heavier part will settle and then will require thinning to reduce it.



Creosote burns the flesh, that you of course know; better rub the hands and wrist and maybe the face with linseed oil before beginning. If the stain does get on hands or face, don't try to rub it off, but apply linseed oil, after which you can rub the part off. Rubbing it while the fresh creosote is on the flesh will only spread it the more. Do not wash it off, for that will simply separate the tar acids and burn you the worse; creosote contains about 10 per cent. of this acid.

Creosote stain will get rather thick in cold weather, which is owing to the small quantity of naphthaline that it contains. When in this condition heat it a little, or put it in a warm place for a time.

Ordinary oil paint is not thought to be good for shingle roofs, but by using a very thin oil paint stain, and dipping the shingles very satisfactory results may be obtained. Or the shingles may be done after laying, same as with creosote. The paint stain should be made from the best pigments. They should be finely ground in raw linseed oil, at the mill of course, and creosote may be stained too with such colors; in fact that is the way the colored creosote stains are produced. Only that the creosote will of course alter the tone of the pigment stain. Yet they will give very nice shades of color.

Raw and burnt sienna and raw and burnt umber are two fine pigments for stains, especially for the creosote stains. But the only green pigment that can be used is the chemically pure, not the green that is made by mixing yellow and blue together. This applies also to the reds, except the oxide reds. They should be chemically pure colors, without any aniline in them. This for permanency, as aniline colors will soon fade in the sun.

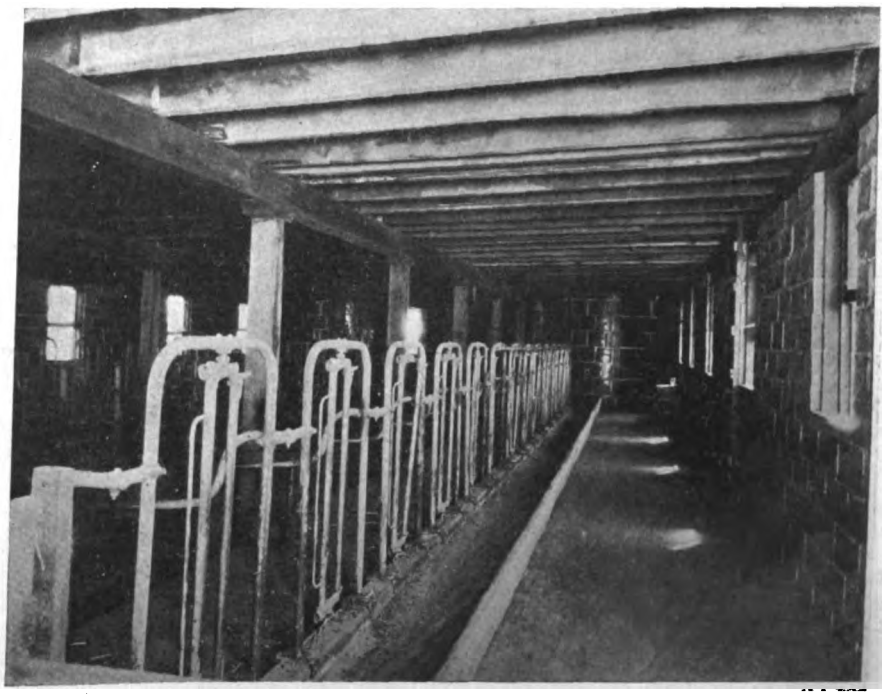
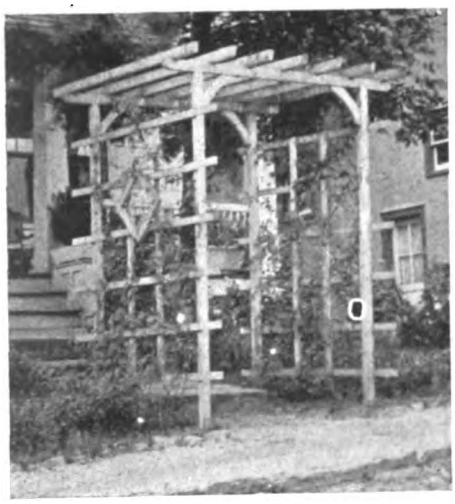
Barn Design of Hollow Tile

THERE are many advantages in having a barn built of other material than wood. A hollow tile barn such as we illustrate here is much warmer than a frame structure, which we too often find with wide cracks in the sheathing, affording but little real protection from the outside cold.



The interesting barn shown here has been built of hollow tile with a vitrified face, it being unnecessary to coat this with stucco. In the construction of a barn such as this, concrete footings are first laid and then the foundation can be made of hollow tile and filled with concrete up to grade, this is frequently omitted; the corners, however, should be filled solid and it is a good plan to put reinforcing rods in the corner blocks.

The interior floors, gutter and trough are of concrete throughout. Note the arrangement of the stalls on the interior view shown below. The feeding can be conveniently done from this alley. Through the center the stalls can be easily cleaned, and milking performed. All of these are equipped with metal stanchions. The silos are built of hollow tile. They are 34 feet high and have a capacity of 80 tons; as shown in the picture, access to the silo is obtained directly from the barn through a door at the bottom of the chute, making a convenient feeding arrangement and eliminating the necessity of the farmer exposing himself in cold or rainy weather to get at this silage.



The barn has an excellent system of ventilation, with pipes well distributed throughout and ending in ventilators on the roof of the building. With well drained floors a barn of this sort will always be dry. The difficulty with most masonry farm buildings is that they are apt to be damp, due to the condensation of moisture from the warmer inside air on the walls. This objection is eliminated by the hollow walls used in the construction of these buildings. The insulating properties of this air space prevents the condensation of moisture on the interior walls by keeping this at the same temperature as the interior of the barn.

A barn arranged in this manner is easily kept sanitary, as it can be kept clean with the least possible labor. An adequate water supply enables the walls to be flushed whenever necessary. There are no parts about the barn or walls to rot, and this means for sanitation.

A fireproof barn that stores hay is out of the question but to diminish the damage from fire many barns are now being erected with the haymow floor of concrete laid on expanded metal lath which is carried on metal lumber beams which are in turn supported by iron posts.

PERGOLAS add greatly to the beauty of home grounds. When the house is finished there are different ways of enhancing its attractiveness and builders who recommend these ideas will surely obtain the extra work. The few designs shown here are good suggestions of what can be accomplished at but small expense to secure pleasing results.

What the Editor Thinks

Are Building Departments to Blame?

BOTH the Brooklyn, N. Y., and Washington, D. C., collapse of theatre roofs has raised the subject of responsibility in the respective Building Departments.

In each case it was shown that the erection was in violation of approved plans, which seems to absolve the Building Department officials *but* they permitted these structures to exist. They were either negligent or powerless to order the necessary changes which the plan examiner had advised.

Are Building Departments to be considered a joke? True, too often, the action and interpretation of the regulations by Department officials is so absurd as to disgust architects and builders.

Chafiing at the delay in passing simple plans, many architects and builders have gone ahead with construction before the plans are approved.

This method is fundamentally wrong. No construction work should be started until plans are approved and then these should be followed.

The object of a building code is protection of the public and to this end, the whole-hearted co-operation of all men involved ought to be given.

The men who comprise the staff of building departments are only human, it is a physical impossibility for them to pass plans promptly at certain seasons of the year when there is a rush, still delays incident to this are very expensive to the contractor.

Would it not be wise to divide the small and large jobs, examining small ones quickly instead of running in numerical order? This numerical method ties up a small job for an unreasonable length of time, if preceded by plans for several large operations.

Inspectors are often bulldozed into passing construction they know is at variance with the approved plans. Many inspectors have heard the remark: "Well its up, what are you going to do about it?" Sometimes the mysterious $$$ high sign is given and the job is O. K!

Every contractor and architect who prepares plans that will have to be approved knows or should know the requirements of the code. Why not live up to the code? Is it the right thing to try and slip something over on the plan examiner, taking a chance that he might not see it? Let us all be square with our building department and then we can insist on their being fair with us.

It is to be hoped that a reasonable National Building Code will come about, then it should receive honest support, as well as honest enforcement.

Improving Construction Methods

NEW methods of construction that will cut down the cost of building should receive earnest consideration.

In all lines of industry the human family are wont to look upon innovations with a sort of suspicion. We go along in the line of least resistance and naturally fall in the habit of using the same paths our ancestors trod.

All of our readers may not approve of the innovations devised by Ernest Flagg which are described on another page but here is a step, or rather several steps, off the beaten path.

If more members of the building industry would give the subject thought in the same way Mr. Flagg has, many new methods of construction would be evolved for lessening cost and increasing conveniences as well as appearance in our homes and other buildings.

We think that the building industry is indebted to Mr. Flagg for the creative work that he has undertaken, to do something definitely helpful.

Apprentices for Building Trades

QUITE a problem faces building contractors of the country, and this is the probability of not securing enough skilled mechanics to carry on the work. When there is plenty of work and comparatively few mechanics, bonuses are in order and we find one contractor bidding against another for help.

The solution of this problem is the recruiting of apprentices for various trades connected with the building industries. But to do this it is up to the contractors to make working conditions more attractive to apprentices.

We must remember that they are the journeymen of tomorrow, they should not be treated as just mere errand or water boys. Unless steps are taken to properly train the youngsters now who is going to lay bricks or do the carpentry or painting in years to come?

Now there are plenty of serious minded young men who are ambitious and they should be encouraged.

One big objection to most building trades is the lack of steady work, now why cannot a bricklayer or roofer also be a painter, electrician or other inside worker? There is nothing hard in learning two or more trades. Teach the kids to be a little more self reliant and show them that there are plenty of good openings in the building game for real workers, and, with fair wages, the work should appeal.

Remodeling Jobs Are Profitable

THERE are many old style large residences in every city that are more or less white elephants to their owners. They are unable to keep them up and cannot sell them except at a great sacrifice. Here is a chance for the progressive builder to get busy and submit a tangible plan to the owner of such a building, showing him how to alter it into stores, apartments, or offices, so that there will be an income from the property.

Review of Building Situation

CONSTRUCTION activity in January, according to figures published by the F. W. Dodge Co., show that the total of contracts awarded (not contemplated) amounted to $166,320,200. This is 16% less than the amount of contracts awarded in December, 1921, but it is 49% greater than January, 1921. This shows very conclusively that the volume of business this year is going to be a big improvement over 1921, and that was considered good.

Residential building still keeps in the lead as 45% of the total is for this class of construction, amounting to $75,728,000. Of this amount $53,269,200, is to be spent in the Eastern States this certainly is a very remarkable showing as it indicates the need of homes in the East is more acute than in the West and South. In the far West, Southern California still remains very active.

In the Northwest district the January figures are 64% less than that for December and 33% less than the total for January, 1921. In the Central West district conditions are much better, the amount of contracts being only 7% less than in December but 19% greater than January, 1921, this is a very healthy sign.

In the Middle Atlantic district there was a decrease of 24% from December figures but a 73% increase over January, 1921. Contemplated new work is 22% over the volume for December.

In the New England district the contracts awarded show a 40% decline from the December figures but it is nearly double that of January, 1921! The figure for contemplated work shows an increase of 40% over that reported for December.

The most activity is disclosed in the New York district, here, although there was a decrease of 13% over December figures, the amount of contracts awarded in January were two and a half times the amount of January, 1921! $35,330,000 or 65% of the total amount of contracts awarded in January is to be spent for residence construction alone.

THE Building Trades Employers' Association of New York City recently made a survey of the employment situation in the building trades throughout the country.

Among other interesting data it gives a list of the building trades in the order, as one might say, of their scarcity. Showing the plasterers in greater demand than any other trade and putting concrete laborers, the supply of whom greatly exceeds the demand, at the bottom of the list with the other trades in between in the following order: 1, Plasterers; 2, Terrazzo Workers; 3, Encaustic Tile Layers; 4, Elevator Constructors; 5, Marble Cutters and Setters; 6, Metallic Lathers; 7, Bricklayers; 8, Painters; 9, Steamfitters; 10, Mosaic Workers; 11, Plumbers; 12, Carpenters; 13, Plasterers' Helpers; 14, Sheetmetal Workers; 15, Cement Finishers; 16, Tar and Felt Roofers; 17, Hod Carriers; 18, Structural Iron Workers; 19, Hoisting Engineers; 20, Electrical Workers and 21, Cement and Concrete Laborers.

Record of January, 1922, Contracts Awarded

Two Houses for One

By A. H. SCOTT

THE day of the large many roomed mansion is passing. This is clearly evident from the number of these big old fashioned houses now on the market. In many cases the death of the owner has resulted in their being closed; the heirs not feeling that they could afford to reopen them due to the expense of maintenance, difficulty of heating, etc.

Such places are usually white elephants in the hands of real estate dealers who are unable to either sell or rent them. There are hundreds of these houses throughout New England which contain material which is too valuable to be allowed to fall into decay and which could be profitably utilized by either tearing down the houses and using the material in the construction of smaller dwellings or by actually cutting them up and remodeling the sections into a number of attractive homes.

The latter course was adopted in Pittsfield, Mass., with the twenty-room house shown in the accompanying views. The project was carefully gone into and it was decided that the building could be literally sawed in two and the resulting sections remodeled into nine and ten-room houses, respectively.

The work of separating the house into sections and moving them to their new locations was done as expeditiously as possible and at a time when favorable weather was anticipated. Precautions were taken, however, to protect the exposed portions with roofing paper as will be observed by referring to the top illustration.

One of the sections was moved across the street and passed between two houses to the next street while the other was moved into position directly in back of it, each house now being on a different street. The material in this old house is of the best and the workmanship painstaking and fine, so that the sections withstood the moving process without damage.

The new owners, therefore, will be assured of having houses of lasting quality and of better workmanship and materials than can be obtained today except at an expense that would prove prohibitive in the majority of home building projects.

The smaller, dark shingled section was moved across the street and through to the next street, while the larger, white painted section remained on the same street, but was moved across to the opposite side.

Note that the bottom view of the dark shingled house is so taken that the rear view of the house built of the other half section is visible across the block on the next street.

The architect who planned the division of the house and rebuilding of the sections was J. A. Vance, and the contractor was C. B. Lindholm, both of Pittsfield, Mass.

ALL readers are invited to ask any questions that will help them solve any legal difficulty that they may be in. Our legal adviser will answer direct by mail and give his opinion as to the correct procedure. Questions and answers of general interest to the trade will be published in these columns. All inquiries must be accompanied by the name and address of the correspondent so that he may be answered direct or that he may be requested for further information if necessary to the intelligent answering of his question. No names will be published, only initials or a nome de plume. Remember that this service is free to subscribers. Address Legal Department, Building Age, 920 Broadway, New York City.

Does Delaying Sub-Contractor Release Him?

WHERE a sub-contract to erect the superstructure of a federal building contemplated commencement of the work by the sub-contractor about May 1st, but the contractor delayed completion of necessary piling, etc., until the latter part of July, the sub-contractor was justified in declaring a cancellation of his agreement. It was so decided by the Michigan Supreme Court in the recent case of Interstate Construction Co. vs. Montague Brothers and United States Fidelity & Guaranty Co., 174 Northwestern Reporter, 173.

On the vital point involved the court remarks:

"The record shows conclusively that it was within the contemplation of all the parties that the work to be performed by the defendants under the sub-contract was to commence within a reasonable time after May 1st. It further shows that defendants prepared at considerable expense to commence performance shortly after that date. A delay of nearly three months ensued, on account of plaintiff's failure to get the piling and foundation in proper shape to permit defendants to undertake the performance of their part of the contract. In the meantime labor conditions had materially changed, or would change before it would be possible for the defendants to complete. Having elected to repudiate the contract, by reason of the antecedent breach thereof by the plaintiffs, we think it was competent for defendants to show that performance thereof under the changed conditions occasioned by the unwarranted delay would have imposed upon them an extraordinary and unwarranted burden."

Accordingly, the court affirmed a dismissal of the contractor's suit to recover on the sub-contractors' bond as for their breach of the sub-contract.

Another interesting and important point involved in this case pertained to the effect of a telegram sent on the date of the execution of the formal contract between plaintiff contractor and defendant sub-contractors. The contract provided promptly upon notice." A telegram sent by the contractor to the sub-contractors, relating to the contract, contained the sentence: "You to start work about May 1st." It was objected by the contractor, in the course of the litigation, that the telegram should be disregarded, the contract speaking for itself. But the Supreme Court says:

"Both papers had reference to the same subject-matter and were parts of a single transaction, and both may be examined for the purpose of ascertaining the agreement of the parties. That agreement would appear to be that the sub-contractor should commence work promptly upon notice, as stated in the contract, and 'about May 1st,' as explained in the telegram."

In a similar case (Hale & Kilburn Co. vs. Gill et al., 257 Federal Reporter, 906) the United States Circuit Court of Appeals, Sixth Circuit, decided that a sub-contractor was not necessarily released from an agreement to install metal doors and trim, picture molding, etc., because the contractor failed to have the building ready for installation of the doors by the time originally contemplated. But this decision is to be reconciled with that of the Michigan court on the ground that in the latter case time was made a vital element of the contract and the sub-contractors never waived their right to have that the work should be "commenced the foundations, etc., ready for erection of the superstructure by the agreed time, whereas in the case before the Circuit Court of Appeals it was found that the sub-contract for installation of the doors did not necessarily make time a vital factor, and that the sub-contractor might be found to have waived requirement that the building be ready for the doors, etc., by a certain time.

The evidence being conflicting as to whether the contractor in the door case unreasonably delayed the sub-contractor, and as to whether the sub-contractor had waived any right to complain of the delay in having the building ready for the doors, the Circuit Court of Appeals holds that it was for the jury to determine whether there was such unreasonable delay or such waiver.

The delay was caused by the general contractor's controversy with the city over the height of the building and its structural strength, and by unforeseen necessity for deeper foundations, etc. It was originally supposed that the building would be ready for the installation of the doors about October 1st, but it was not ready until December. In the meantime and on October 16th, the sub-contractor gave notice of his cancellation of the sub-contract.

Damages Recoverable for Termination of Contract by Owner

A VERY instructive appellate court decision on the subject of the measure of damages recoverable by a building contractor where he is wrongfully prevented by the owner from fully performing his agreement appears in the case of Di Luck vs. Bradner Co., 190 Pacific Reporter, 904, decided by the Washington Supreme Court.

The Superior Court in Seattle allowed plaintiff damages for wrongful cancellation of a contract for the construction of floors in an apartment building, but

Digitized by Google

the Supreme Court reduced the amount of the award on the ground that excessive damages were awarded, saying:

"The testimony shows that the profits which might reasonably be anticipated upon the contract as awarded would amount to $332.85; this being the difference between the contract price and what it would have cost the plaintiff to have performed the work called for in the contract. . . . The testimony also shows that, had the contract been performed, the plaintiff intended to work thereon, and he would have been provided with 34 days of work at $7 per day, and that during the period he would have been performing the contract he diligently sought for other work and secured it, for which he earned $105, and the judgment allowed him the difference between $238 and $105, or $133.

"This second item of damages was erroneously allowed for the reason that the contract was a building contract, and not a contract for services, and plaintiff is not entitled to double damages by treating it as both sorts of contracts. When the work was done, had he completed it, he would only have received the contract amount, which would have included his own work or the work of whomsoever he had employed in his stead; for all of the work was to be done for the price of the contract. When the defendants let the contract, they were not hiring the plaintiff, nor was it material to them whether he labored himself or secured and paid for the labor of others."

Sufficiency of Contractor's Monthly Statement of Work Done

A CLAUSE in a building contract requiring the contractor to furnish monthly statements to the supervising architect in writing, "setting forth the exact percentage of the materials received at the building and the exact percentage of the work installed" as a basis for making partial payments, "is not complied with by a mere general statement of percentages, holds the California District Court of Appeal in the case of Sinnott vs. Schumacher, 187 Pacific Reporter, 105.

In this case it was decided that the builder failed to entitle himself to partial payment by furnishing a statement "that the exact percentage as near as is possible to make it of the materials received at the building is 8 per cent. thereof, and the exact percentage of the work installed as near as is possible to make it is 8 per cent. thereof." The court says:

"The purpose of requiring such a report from the contractor to be made to the architect is manifestly to enable the architect to correctly compute the amount of the installment which shall be due and payable to the contractor on the first day of each month as the work progresses, and it should require no argument to show that the mere general statement or conclusion of the contractor as to the percentage of materials received and work installed upon the building at the time he requires the installment payment upon the cost thereof does not amount to a compliance with the foregoing provision of this contract."

Accordingly, it was decided that for want of proper statement, the owner was not in default in failing to make a partial payment, and that refusal to make the payment constituted no such breach on the owner's part as justified the builder in throwing up the work.

Transaction of Business by Corporation in Other States

IN the course of a year corporate building contractors frequently take long chances, unwittingly, on becoming unable to collect compensation for work done in states other than where they were incorporated. This risk rises from the fact that most states have laws forbidding transaction of business within their borders by corporations not organized in the state, unless such corporations first obtain a permit to do business in the state by filing copies of their articles of incorporation, etc. Compliance with these laws is often overlooked.

But since these laws do not affect the right of a corporation to do an interstate business, being limited in their effect to the transaction of purely intrastate business, it often becomes a doubtful question as to whether a certain transaction is interstate or intrastate. There is no room for doubt that ordinary building operations are of purely local nature, although the nonresident corporation may ship the materials, and send workmen, from its home state to the place where the work is to be done. On the other hand, it has been decided that where things of a complex nature, requiring expert services in installing them, are shipped into a state from the outside, performance of the work of installation by the nonresident company's nonresident expert employees does not constitute such doing of business by the company in the state as makes obtaining of a permit necessary.

In the recent case of Decorators' Supply Co. vs. Chausee, 178 Northwestern Reporter, 665, decided by the Michigan Supreme Court, plaintiff was denied the right to recover for ornamental plaster work installed in a school building at Sault Ste. Marie, because it was a nonresident corporation and had failed to obtain a license to do business in Michigan. The company's attorneys attempted to show that the case fell within the rule last above stated, but the Supreme Court said:

"One local man was used to assist the factory representative in the erection of the material. The record discloses that there are concerns in at least two or three cities in Michigan furnishing ornamental plaster work in competition with the plaintiff, and it is apparent that there are mechanics in the state entirely competent to erect such material. We think it is equally apparent that there is no such 'intrinsic or peculiar quality or inherent complexity' in the article sold in the case at bar as would prevent its sale unless erected by the vendor. . . .

"The circuit judge was correct in holding that the plaintiff cannot succeed, because it was an undomesticated foreign corporation, engaged in instrastate business."

When Lien and Compensation Rights Are Lost

THE Iowan Mechanics' Lien Law, like the statutes of some of the other states, contains a provision to the effect that the granting of liens in favor of sub-contractors shall not be regarded as requiring the owner to pay any greater amount to discharge a lien or at any earlier date than is provided for payment in his contract with principal contractor.

Applying this statute in the case of Kawneer Manufacturing Co. vs. Renfro & Lewis et al., 173 Northwestern Reporter, 899, the Iowa Supreme Court holds that where, under the terms of a building contract, nothing has become due the contractor because of his failure to complete work, no lien can be established in favor of him, a materialman, or subcontractor.

In this case plaintiff sought to establish a lien for lumber furnished to a general contractor, but failed because it appeared that the principal contract did not provide for any payment until after the completion of the building, and that the building fell before being completed or delivered to the owner.

"By that contract," says the court, "the owners agreed to pay the stated price when the work was completed according to the plans and specifications, and they cannot be put in default until those terms are complied with. Concededly the principal contractors have never performed, and have therefore never become entitled to payment. Proof of their negligence and the consequent destruction of the building is only material as showing the destruction of the subject-matter of their employment was not due to the fault of the owners.

"The contractors are denied the right to recover, not because of their negligence, but because they have not performed their agreement. Had they abandoned the building in its unfinished condition, or had tendered or turned it over to the owners in such condition, then the question of substantial performance, or whether they could recover the reasonable value of the work done, would be of pertinence; but it has none under the record as it stands."

Trend of Material Prices

THE following are wholesale prices of basic building materials in the three markets which set prices for the rest of the country.

These prices are presented to show the trend of the wholesale market, which forecasts prices in the retail market. They are not prices which the average contractor can buy at, but are quoted to show him the movement of materials so that he can buy to better advantage.

Followed in conjunction with the Review of Building Conditions, these prices will prove invaluable.

All prices are for carload lots, F. O. B. market quoted unless otherwise noted.

The Up To Date Farm

Is the farm with clean, well-kept buildings, where the doors are hung so they will open at a touch but won't jump the track.

The "Big 4" Hanger makes possible the hanging of doors that roll easily and smoothly. The door may be swung outward if necessary, but it will never jump the track.

Easy to install. Comes packed ready for use with bolts. We supply our dealers with model doors that show how easy the "Big 4" operates.

Your dealer will demonstrate

Selected List of Manufacturers' Literature

FOR THE SERVICE OF BUILDERS, CONTRACTORS, ARCHITECTS AND ENGINEERS

The publications listed in these columns are the most important of those issued by leading manufacturers identified with the building industry. They may be had without charge, unless otherwise noted, by applying on your business stationery to Building Age and The Builders' Journal, 920 Broadway, New York, or the manufacturer direct, in which case kindly mention this publication. Either the titles or the numbers may be used in ordering.

Listings in this Department are available to any manufacturer at the rate of $5 per listing per month.

ANCHORS—See Bolts

ASBESTOS PRODUCTS

Asbestos Shingle, Slate & Sheathing Co., Ambler, Pa.

1. *Ambler Asbestos Shingles.* Catalog. 5½ x 8½ in. 40 pp. Illustrated.
2. *Ambler Asbestos Corrugated Roofing and Siding.* Catalog. 8½ x 11 in. 36 pp. Illustrated. Standard Purlin Spacing Tables.
3. *Ambler Asbestos Corrugated Roofing and Siding.* Catalog, 8½ x 11 in. 20 pp. Illustrated. Prices and specifications.
4. *Ambler Asbestos Building Lumber.* Catalog, 8½ x 11 in. 32 pp. Illustrated.
5. *Engineers' Data Sheets.* Catalog, 8½ x 11 in. 40 pp. Illustrated. Specifications and working sheets for Ambler Asbestos Corrugated Roofing and Siding.

ASBESTOS ROOFING—See also Roofing

ASH HOISTS—See also Hoists

Gillis & Geoghegan, 537 West Broadway, New York, N. Y.

6. *General Catalog.* Contains specifications in two forms, (1) using manufacturer's name, and (2) without using manufacturer's name. Detail in ¼ in. scale for each telescopic model and special material handling section. Fully illustrated with photographs of actual installations and descriptive matter of same. 20 pp., 2 colors, 8½ in. x 11 in.

ASH RECEIVERS

Sharp Rotary Ash Receiver Corporation, 396 Bridge St., Springfield, Mass.

7. *Catalog E.* Booklet describing the Sharp Rotary Ash Receiver with illustrations of houses in which the furnaces are equipped with this device. 24 pp. Ill. 6 x 9¼ in.
8. *Catalog F.* A book for architects and builders telling what the Sharp Rotary Ash Receiver is and what it does; together with tables of dimensions for installation. 8 pp. Ill. 6 x 9¼ in.

BALANCES, SASH

Caldwell Mfg. Company, The, Rochester, N. Y.

9. *Suggestions for the Present-Day Architect.* Booklet. 6 x 9 in. 16 pp. Illustrated. Gives full-size dimensions and information for the purpose of writing specifications for Caldwell Sash Balances.

Pullman Mfg. Co., Rochester, N. Y.

10. *Catalog* describes new form of sash balance that can be removed and inserted without removing sash from window.

BAND SAWS

American Saw Mill Machinery Co., Hackettstown, N. J.

11. *Catalog No.* 22 describing a general line of band saws of various sizes.
12. *Technical Data.* Four-page folder, 8½ x 11 in. containing specifications, description, prices and approximate cost of installation. Everything the architect or contractor requires. Proper size for filling.

Crescent Machine Co., Leetonia, Ohio.

Descriptive 144-page Catalog.

BAR BENDERS AND CUTTERS

Koehring Company, Milwaukee, Wis.

13. *Four-page folder,* giving illustrations and sizes of Koehring Bar Benders and Cutters.

BEDS

Murphy Door Bed Company, Majestic Bldg., Chicago, Ill.

BOILERS—See Heating Equipment

BOLTS

National Lead Company, 111 Broadway, New York, N. Y.

14. *Cinch Bolt Booklet.* An illustrated booklet of Cinch Bolt Specialties. 20 pp. 3½ x 6¼ in.

BOOKS

American Technical Society, Chicago, Ill.
Architectural House Planning Service Co., 20 So. 18th Street, Philadelphia, Pa.
Arrow Book Company, 347 Fifth Avenue, New York City.
U. P. C. Book Company, 243 West 39th Street, New York City.
Frank R. Walker Co., 2209 B .Archer Ave., Chicago, Ill.

BRICK

American Face Brick Association, 110 South Dearborn St., Chicago, Ill.

15. *The Story of Brick.* Contains the history of, and basic requirements of building brick, artistic, sanitary and economic reasons, comparative costs, and fire safety with photographs and drawings, and illustrates ancient and modern architectural works of note in brick. Sent free.
16. *A Manual of Face Brick Construction.* The history of brick making, types of face brick, showing details of construction for walls, chimneys and arches. Details of use of tile and brick construction and different types of bonds are given. A series of plans and elevations of small brick houses, descriptions, useful tables and suggestions and illustrated and described. Size 8½ x 11 in. 116 pp. Price $1.00.
17. *The Home of Beauty.* A booklet containing fifty prize designs for small brick houses submitted in national competition by architects. Texts by Aymar Embury II, Architect. Size 8 x 10 in. 72 pp. Price 50 cents.
18. *Architectural Details in Brickwork.* Three series of beautiful half-tone prints of brickwork detail, contained in closed folders suitable for standard vertical letter file. The three series contain 124 prints in all. Size 8½ x 11 in. Price $1.50 per set.

Common Brick Manufacturers' Association of America, 1309 Schofield Bldg., Cleveland, Ohio.

19. *Brick—How to Build and Estimate.* 3rd edition, 32nd thousand, a manual of solid brick and Ideal wall construction. Contains data on the strength of brickwork, on mortars, bonds and joints and equipment, and contains complete estimating tables for quantities of brick, mortar, material and approximate mechanics' time for various thicknesses and square foot areas of solid and Ideal wall. 8½ x 11 in. 72 pp. Price 25 cents.
20. *Brick for the Average Man's Home.* Book. 8½ x 11 in. 72 pp. Color plates. Book of plans for bungalows, houses and apartments for which working drawings are available. Price $1.00.

Fiske & Company, Boston, Mass.

Tapestry brick, other grades of front brick. Manufacturers of "Fisklock" Brick.

BUILDING CONSTRUCTION—See also Garage Construction

National Manufacturing Co., Sterling, Ill.

Truscon Steel Company, Youngstown, Ohio.

21. *Truscon Floortype Construction.* Form D-352. Contains complete data and illustrations of Floortype installations. 16 pp. Ill. 8½ x 11 pp.
22. *Truscon Standard Buildings.* Form D-398. Describes Truscon Standard Steel Buildings, with diagrams, illustrations of installations, descriptive matter and list of users. 48 pp. Ill. 8½ x 11 in.
23. *Truscon Building Products.* Form D-376. Contains a brief description of each of the Truscon Products. 112 pp. Ill. 8½ x 11 in.
24. *Modern School Construction.* Form D-395. Contains illustrations of schools, with typical elevations, showing advantages of Truscon Products for this construction. 16 pp. Ill. 8½ x 11 in.

BUILDING HARDWARE—See Hardware

BUILDING STONE—See Stone, Building

BUILT-IN CLOTHES HANGERS

Knape & Vogt, Grand Rapids, Mich.

BUNGALOW AND SMALL HOUSE PLANS

American Face Brick Association, 110 South Dearborn St., Chicago, Ill.

25. *Four booklets* of small houses from 3 to 8 rooms, containing 98 reversible designs. (1) 3-4 rooms, (2) 5 rooms, (3) 6 rooms, (4) 7-8 rooms; size 8½ x 11 in. Each booklet 25 cents, set $1.

Architectural House Planning Service Company, 20 South 18th Street, Philadelphia, Pa.

Keith Corporation, 533 Abbay Bldg., Minneapolis, Minn.

26. *Twelve different plan books* at $1 each. Cottages, bungalows, two-family garages, etc.
27. *Fifty Small Homes of Character.* Price $1. Working drawings, specifications and models of small homes.

CANVAS

Williams L. Barrel Company, 50 Leonard Street, New York.

28. *Consertex Canvas Roofing and Deck Cloth.* Catalog A-1—Roofing Facts and Figures. Consertex is a specially waterproofed and treated roofing canvas guaranteed wear and rot-proof for decks, piazza floors, sleeping balconies, sun parlors, etc., etc.

This Redwood log was sound and free from decay when dug up after 600 years' burial in moist soil — proved by the annular rings of the giant tree that grew over it.

Where You Should Use Rot-Resisting Moisture-Proof Redwood

FOR siding and porch work on which climbing vines retain moisture and foster the development of mould and decay, for shingle roofs shaded by trees so that they dry out slowly—wherever moisture lodges you can guarantee freedom from rot and decay if you use Redwood.

In addition to rot-resistance, which is due to a *natural* odorless preservative that permeates every fibre of Redwood during the growth of the tree, you will find that the high percentage of clear lumber in every car of our production cuts waste to a minimum. There's an evenness of texture and a uniformity about T. P. L. Co. Redwood, a dependable dryness and easy wood-working quality that keeps down labor costs.

You can buy T. P. L. Co. Redwood lumber and mill work at prices not greatly higher than for other lumber which cannot compare with Redwood for rot-resistance, freedom from shrinking, swelling and warping, for good painting surfaces, and low average of knots, splits and other common defects.

For the convenience of builders and architects we have recently issued our "Construction Digest" and our "Engineering Digest," which either our New York or Chicago office will gladly forward on request, together with mill work and frame lists of Redwood items of our manufacture. Write for them.

Amalgamated Roofing Co., 431 So. Dearborn Street, Chicago, Ill.
Asbestos Shingle, Slate & Sheathing Co., Ambler, Pa.
Cortright Metal Roofing Co., Philadelphia, Pa.
Illinois Zinc Co., 280 Broadway, New York.
National Sheet Metal Roofing Co., 339 Grand Street, Jersey City, N. J.
Rocbond Co., Van Went, Ohio.
F. C. Sheldon Slate Co., Granville, N. Y.

DOOR CHECKS

Park Manufacturing Co., Worcester, Mass.
50. *Catalog* contains description of six models of the new improved Worcester-Blount Door Check.

DOORS AND WINDOWS

Hess Warming & Ventilating Co., 1201 Tacoma Bldg., Chicago, Ill.
Henry Hope & Sons, 103 Park Ave., New York.
51. *Hope's Casements and Leaded Glass.* Portfolio. Gives specifications, description and photo-engraving, of Hope Casements in English and American Architecture, full size details of outward and inward opening and pivoted casements, of residential and office types. Size 12¾ x 18½ in. 32 pp.

Paine Lumber Co., Oshkosh, Wis.
54. *Illustrated Catalog* of 36 pp. describing the new style "Miracle" Door.

Truscon Steel Company, Youngstown, Ohio.
52. *Truscon Steel Sash.* This handbook has been prepared for detailers and specification writers. The descriptions are clear and the details are complete. 80 pp. Ill. 8½ x 11 in.
53. *Truscon Steel Sash.* A catalog containing designing data, tables and views of Stock Sash installations. 6 pp. Ill. 8½ x 11 in.

DOOR AND WINDOW FRAMES

Andersen Lumber Company, South Stillwater, Minn.
55. *General Catalog* for architects, contractors, engineers, carpenters or builders. Describes and illustrates fully Andersen Standard White Pine Window, Cellar Frames, Sash Frames and Door Frames. Gives details of construction, variety of sizes and uses for ordinary as well as special construction, and method of assembly. Size 7¼ x 10¼, 24 pages.
56. *Better Frames for Less Money* for consumers. Interesting folder showing advantages of Andersen Standard White Pine Frames. Uses, sizes and details of construction.

DUMBWAITERS

Kimball Bros. Co., 1106 Ninth Street, Council Bluff, Iowa.
Sedgwick Machine Works, 156 W. 15th Street, New York.
57. High grade Hand Power Elevators and Dumbwaiters for All Purposes. Illustrated catalog, 52 pages; dumbwaiter service sheet, and pamphlets descriptive of many special types of outfits.

Williamsport Wire Rope Co., Williamsport, Pa.

DRAFTING MATERIALS

A. S. Aloe Company, 513 Olive Street, St. Louis, Mo.
Keuffel & Esser Co., Hoboken, N. J.
Kolesch & Co., 138 Fulton Street, New York.
Wickes Bros., 1301 Water Street, Saginaw, Mich.

ELEVATORS

Kimball Brothers Company, Council Bluffs, Iowa.
58. *Kimball Elevators.* An illustrated catalog of hand power, sidewalk, and garage elevators and dumbwaiters and electric passenger, freight and push button elevators. 32 pp. Ill. 7¾ x 10½ in.

Richards-Wilcox Mfg. Co., Aurora, Ill.
59. *"Ideal" Elevator Door Equipment.* Catalog showing elevator door hangers for one, two and three speed doors, also doors in pairs and combination swing and slide doors. Door closers and checks. 24 pp. Ill. 8½ x 11 in.

Sedgwick Machine Works, 156 West 15th Street, New York.

FACTORY EQUIPMENT

The Edwards Mfg. Co., Cincinnati, Ohio.
60. *Edwards' Steel Equipment.* Illustrated catalog. Showing steel lockers and shelving for factories, offices, stores, schools and hospitals, together with illustrations and description of "Edmanco" steel office furniture and filing cabinets. Size 8 x 11 in. 32 pp.

FIREPLACES AND MANTELS

Stover Mfg. & Engine Co., 747 Lake Street, Freeport, Ill.
Strait & Richards, Inc., Newark, N. J.
62. *Catalog* describing fireplaces, electric and gas logs, heating supplies, heaters, etc.

FLOOR HARDENERS

Truscon Laboratories, The, Cor. Caniff Avenue and Grand Trunk R. R., Detroit, Mich.
61. *Agatex and Its Performances.* Booklet. 8½ x 11 in. Describes the methods of hardening concrete floors by the application of a chemical which forms a new surface as hard as agate.

FLOORING

The Long-Bell Lumber Co., R. A. Long Building, Kansas City, Mo.
63. *The Perfect Floor.* Tells how to lay, finish and care for Oak Flooring. 16 pp. 14 Illus. 5½ x 7½ in.

Maple Flooring Mfgs. Assn., Stock Exchange Bldg., Chicago, Ill.
Booklet, How to Lay and Finish Maple, Beech and Birch Floors.

Oak Flooring Manufacturers Association, 1014 Ashland Block, Chicago, Ill.
64. *Modern Oak Floors.* Booklet. 6½ x 9¼. 24 pp. Illustrated. A general book that tells the complete story on Oak Flooring.
65. *Oak Flooring, How and When to Use It.* Booklet. 3½ x 6¼ in. 16 pp. Illustrated. A small, technical book showing the general rules, standard thickness and widths, how to lay, finish and care for oak floors.

Pacific Lumber Co., 2070 McCormick Bldg., Chicago, Ill.
United States Gypsum Company, 205 W. Monroe Street, Chicago, Ill.
66. *Gypsum Poured, Steel Reinforced.* Loose-leaf bulletins, ½ x 11. Pyrofill.

Wood Mosaic Co., New Albany, Ind.

FLOOR SURFACING

Amer. Floor Surfacing Machine Co., 521 So. St. Clair Street, Toledo, Ohio.
Wayvell Chappell & Co., 137 No. Jackson Street, Waukegan, Ill.
M. L. Schleuter, 223 W. Illinois Street, Chicago, Ill.
Universal Floor Scraper Co., 110 Exchange Street, Worcester, Mass.

COVER YOUR BUILDINGS WITH REAL ROOF INSURANCE

All an insurance policy does is to guarantee that the holder will be reimbursed if he sustains a loss—it does **not prevent the loss itself**—it does not stop the lightning's flash—it does not hold back the rush of flame from adjoining properties—it does not keep out dashing rain and the seeping trickle of melting snow and ice.

But you **can** insure against damage by lightning, fire, wind and water, if you put on the **right kind** of tin **roof.** For roofing tin is **fireproof** and not just "fire-resistive." It is water-tight and not just weather-tight. It **actually** diverts lightning from its destructive path.

Cover your buildings with real roof insurance by using

TARGET AND ARROW

Look for this Trade ➵ *Mark on every Sheet*

ROOFING TIN

(Prior to 1905 called Taylor's "Old Style.")

for the entire roof, or for valleys, gutters and flashings.

Target and Arrow is made by a hand-dipping process based on an old Welsh method of making terne plates which calls for an unusual amount of skill and judgment on the part of the men who carry on this work.

The two men, whose pictures and histories appear on either side of the page, are typical of the workers who make Taylor products.

N. & G. TAYLOR COMPANY

300 Chestnut St., Philadelphia, Pa.

Headquarters for good roofing tin since 1810

One of Our Experts

David Thomas (Tinner), born in Swansea, Wales, in 1858. He learned his trade in a tin mill in the old country. He has been making tin plate for the Taylors for the **past thirty years** and is still going strong.

One of Our Experts

Ben. Price, Sr. (Tinner), who has been making tin plate for **38 years!** Born in Aberavon, Wales. He started to work there in a tin plate mill. Later he came to this country and has been with the Taylor Company since 1909.

Long-Bell Lumber Co., R. A. Long Building, Kansas City, Mo.
104. *The Post Everlasting.* Booklet. 10½ x 7½ in. 32 pp. Illustrated. Information regarding creosoted yellow pine fence posts, barn poles, paving blocks, etc.
228. *Poles That Resist Decay.* Booklet. 9¼ x 4 in. 16 pp. Illustrated. Poles for telegraph, telephone, high power transmission lines.
105. *"From Tree to Trade,"* a 48-page illustrated description of the manufacture of lumber from tree to use. Describes methods of logging, construction, etc.

Pacific Lumber Company of Illinois, The, 1105 Lumber Exchange Building, Chicago, Ill.
106. *Engineering Digest.* Redwood Information Sheets. 1. General Data Sheet on Redwood, its Production and Uses. 2. Tanks and Vats for Water Acid and Alkali Solutions and Oil. 3. Pipe for Water, Chemicals and Sewage Conveying. 6. Farm and Dairy Buildings and Equipment, Silos, Tanks, Pipes, Outbuildings, Irrigation Flumes, Drainage Boxes, Greenhouses, etc. 9. Railroad Construction and Equipment. 10. Industrial Building Materials. 11. Residential Building Materials.

Southern Cypress Mfrs. Assn., 1227 Poydras Bldg., New Orleans, La.
107. *Many interesting booklets* on the use of Cypress for all purposes.

LUMBER, ASBESTOS

Asbestos Shingle, Slate & Sheathing Co., Ambler, Pa.
108. *Ambler Asbestos Building Lumber.* Catalog illustrated. Describes uses of this fireproof product for both exteriors and interiors. Tables of sizes and illustrations of various types of buildings in which it has been used. Size 8½ x 11 in. 32 pp.

MARBLE, ARTIFICIAL

Art Stone Co., Waynesboro, Pa.

METAL FORMS

Blaw-Knox Company, Pittsburgh, Pa.
109. *Collapsible steel forms for concrete construction.* Interesting descriptive catalog.

METAL LATH—See Lath, Metal and Reinforcing

METALS

American Sheet & Tin Plate Co., Frick Building, Pittsburgh, Pa.
111. *Reference Book.* Pocket Edition. 2½ x 4½ in. 168 pp. Illustrated. Covers the complete line of Sheet and Tin Mill Products.
112. *Copper—Its Effect Upon Steel for Roofing Tin.* Catalog 8½ x 11 in. 28 pp. Illustrated. Describes the merits of high grade roofing tin plates and the advantages of the copper-steel alloy.
113. *Apollo and Apollo-Keystone Galvanized Sheets.* Catalog. 8½ x 11 in. 20 pp. Illustrated.
114. *Research in the Corrosion Resistance of Copper Steel.* Booklet. 8½x 11 in. 24 pp. Illustrated. Technical information on results of atmospheric corrosion tests of various sheets under actual weather conditions.
115. *Facts Simply and Briefly Told.* Booklet. 8½ x 11 in. 16 pp. Illustrated. Non-technical statements relating to Keystone Copper Steel.
116. *Black Sheets and Special Sheets.* Catalog. 8½ x 11 in. 28 pp. Illustrated. Describes standard grades of Black and Uncoated Sheets, together with weights bundling tables, etc.
Bright Tin Plates. Catalog. 8½ x 11 in. 16 pp.

N. & G. Taylor Co., Philadelphia, Pa.
117. *Booklet and Detail Sheet of Tin Roofing.* See Roofing.

METAL TRIM—See Doors, Windows and Trim, Metal

MILLWORK—See also Lumber—Building Construction—Doors and Windows

MORTAR—See also Cement

MORTAR COLORS

Clinton Metallic Paint Co., Clinton, N. Y.
118. *Clinton Mortar Colors.* Booklet. 3½ x 6¼ in. 8pp. Illustrated. Complete description of Clinton Mortar Colors with color samples.

MOULDINGS, METAL

National Metal Molding Co., 25 Fulton Building, Pittsburgh, Pa.
119. *Bulletins.* Bound in a standard correspondence folder, suitably indexed for convenient filing, describes complete line of metal moldings.
120. *Handbook for the Man on the Job.* An illustrated book of fittings and methods, with description and instructions for installing National Metal Molding under all conditions; a book meant to be conveniently carried and used on the job. Size 4¾ x 6 in. 102 pp.

PAINTS, STAINS, VARNISHES AND WOOD FINISHES

Bird & Company, J. A. & W., 88 Pearl Street, Boston, Mass.
121. *Ripolin Specifications.* Booklet. 8 x 10½ in. 12 pp. Description. Contains twenty-one carefully prepared specifications for undercoats for different types of work.

S. C. Johnson & Son, Racine, Wis.
122. *The Proper Treatment for Floors, Woodwork and Furniture.* Booklet. 6¼ x 8¾ in. 32 pp. Illustrated in color. A treatise on finishing hard and soft wood in stained and enameled effects; also natural wood effects.
123. *Portfolio of Wood Panels.* 5½ x 10¼ in. 14 pp. A portfolio containing actual panels of finished woods. Also contains valuable information on finishing and re-finishing floors and woodwork.

National Lead Company, 111 Broadway, New York, N. Y.
124. *Handy Book on Painting.* Book. 5½ x 3¼ in. 100 pp. Gives directions and formulas for painting various surfaces of wood, plaster, metal, etc., both interior and exterior.
126. *Red Lead in Paste Form.* Booklet. 6¼ x 3½ in. 16 pp. Illustrated. Directions and formulas for painting metals.
127. *Came Lead.* Booklet. 8¾ x 6 in. 12 pp. Illustrated. Describes various styles of lead cames.
128. *Cinch Anchoring Specialties.* Booklet. 6 x 3½ in. 24 pp. Illustrated. Describes complete line of expansion bolts.
129. *That Magic Thing Called Color.* Booklet. 5½ x 8½ in. 24 pp. Illustrated. Short treatise on the use of color in the home, special reference to walls and ceilings.
130. *Architects' Specification Manual.* 8½ x 11 in. 50 pp. Complete specifications for all paint products.

Eugene E. Nice & Company, 268 South Second Street, Philadelphia, Pa.
125. *Price List "CO1"* contains descriptions of various paints, japans, varnishes, glue, stains, varnish remover, etc. 48 pp. Pocket size. Sent to any address.

Truscon Laboratories, The, Cor. Caniff Avenue and Grand Trunk R. R., Detroit, Mich.
131. *Spread the Sunshine Inside.* Booklet. 5 x 8 in. 24 pp. Describes methods for light saving by the application of light reflecting enamels to interior walls of factories.

PARTITION SYSTEM

United States Gypsum Company, 205 W. Monroe St., Chicago, Ill.
133. *Loose leaf bulletins,* 8½ x 11 in. Jester-Sackett, consists of plaster board applied to metal channels with special clip, ready for plastering.

PARTITION TILE

United States Gypsum Company, 205 W. Monroe St., Chicago, Ill.
134. *Fireproof.* 32-page booklet, 8½ x 11 in., including description, specifications, and working details of Pyrobar partition tile.

PLASTER—(Interior)

United States Gypsum Company, 205 W. Monroe St., Chicago, Ill.

PLASTER BOARD

United States Gypsum Company, 205 W. Monroe St., Chicago, Ill.
135. *Pamphlets,* describes Sackett Plaster Board used instead of wood or metal lath.

PLUMBING SUPPLIES

Hardin-Lavins Co., 4538 Cottage Grove Avenue, Chicago, Ill.

Hess Warming & Ventilating Co., 1205D Tacoma Building, Chicago, Ill.
136. *Hess Sanitary Steel Medicine Cabinets.* Booklet. 4 x 6 in. 16 pp. Illustrated.

PUMPS

C. H. & E. Mfg. Co., Milwaukee, Wis.
Bulletin No. 2. Pumps.

The F. E. Myers & Bro. Co., Ashland, Ohio.
137. *General Catalog.* 6 x 9 in. 392 pages. Shows complete line of Myers Products—Pumps for Every Purpose, Hay Tools, Door Hangers, Store Ladders, etc. Of particular interest to hardware and implement dealers; plumbers, architects, contractors and builders; mill, mine, factory and railway superintendents and purchasing agents; highway contractors and builders.
138. *Catalogs.* 6 x 9 in. Devoted to separate lines: No. 55, Pump—Hand and Power Pumps; No. PP-55, Power Pumps; No. HT-55, Hay Tools, Door Hangers and Store Ladders; No. HP-22, Hydro-Pneumatic Pumps, Electric House Pumps, Direct Water Systems; No. SOP-21, Self-Oiling Power Pumps; No. MC-21, Cylinders and Working Barrels; No. SP-22, Spray Pumps and Spraying Accessories. All catalogs fully illustrated.

REFRIGERATION

McCray Refrigerator Co., 2264 Lake Street, Kendallville, Ind.

ROOF DECKS

United States Gypsum Company, 205 W. Monroe St., Chicago, Ill.
139. *Loose leaf bulletins.* 8½ x 11. Describing Pyrobar Roof Tile, which is laid directly on purlins or tee irons, joints grouted, and is then ready for roof covering.

ROOFING MATERIALS

Amalgamated Roofing Co., 431 So. Dearborn Street, Chicago, Ill.

American Sheet & Tin Plate Company, Pittsburgh, Pa.
140. *"Better Buildings."* Catalog. 8½ x 11. 32 pp. Describing Corrugated and Formed Sheet Steel Roofing and Siding Products—Black, Painted and Galvanized; together with directions for application of various patterns of Sheet Steel Roofing in various types of construction.

Asbestos Shingle, Slate & Sheathing Co., Ambler, Pa.
141. *Specifications and Price List.* Descriptive booklet. Details of Ambler Asbestos Cement Roofing Slates, "Century" Asbestos Shingles and Asbestos Corrugated Sheathings. Tables and drawings. Size 6 x 9 in. 44 pp.
142. *Ambler Asbestos Corrugated Roofing.* Catalog gives complete data for specifying, drawings, methods of application, tables, etc. Size 8½ x 11 in. 20 pp.

Wm. L. Barrell Co., of N. Y., Inc., 50 Leonard Street, New York.
143. *Prepared Canvas for Roofing.* Samples can be obtained on application. A canvas for every use.

Bird & Son, Inc., East Walpole, Mass.
144. *Makers of crushed slate asphalt roofing* in roll and shingle form.

John Boyle & Co., Inc., 112-114 Duane Street, New York, N. Y.
145. *Boyle's Bayonne Roof and Deck Cloth.* List B 93. A prepared roofing canvas guaranteed waterproof for decks and the roofs and floors of piazzas, sun-parlors, sleeping porches, etc.

Creo-Dipt Company, 1025 Oliver Street, North Tonawanda, N. Y.
153. *Standard Stained Shingle.* Samples of different kinds mailed on request.

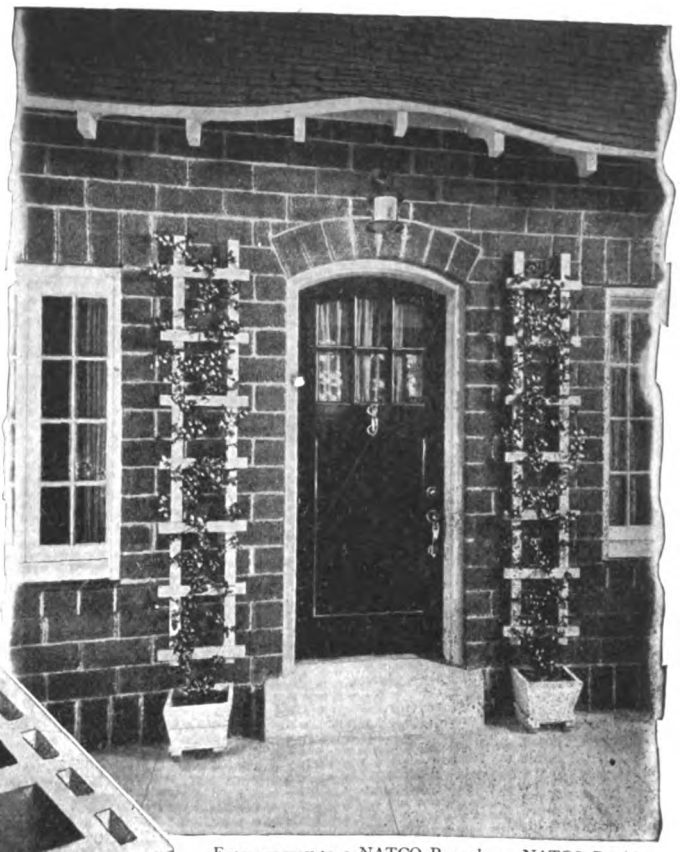
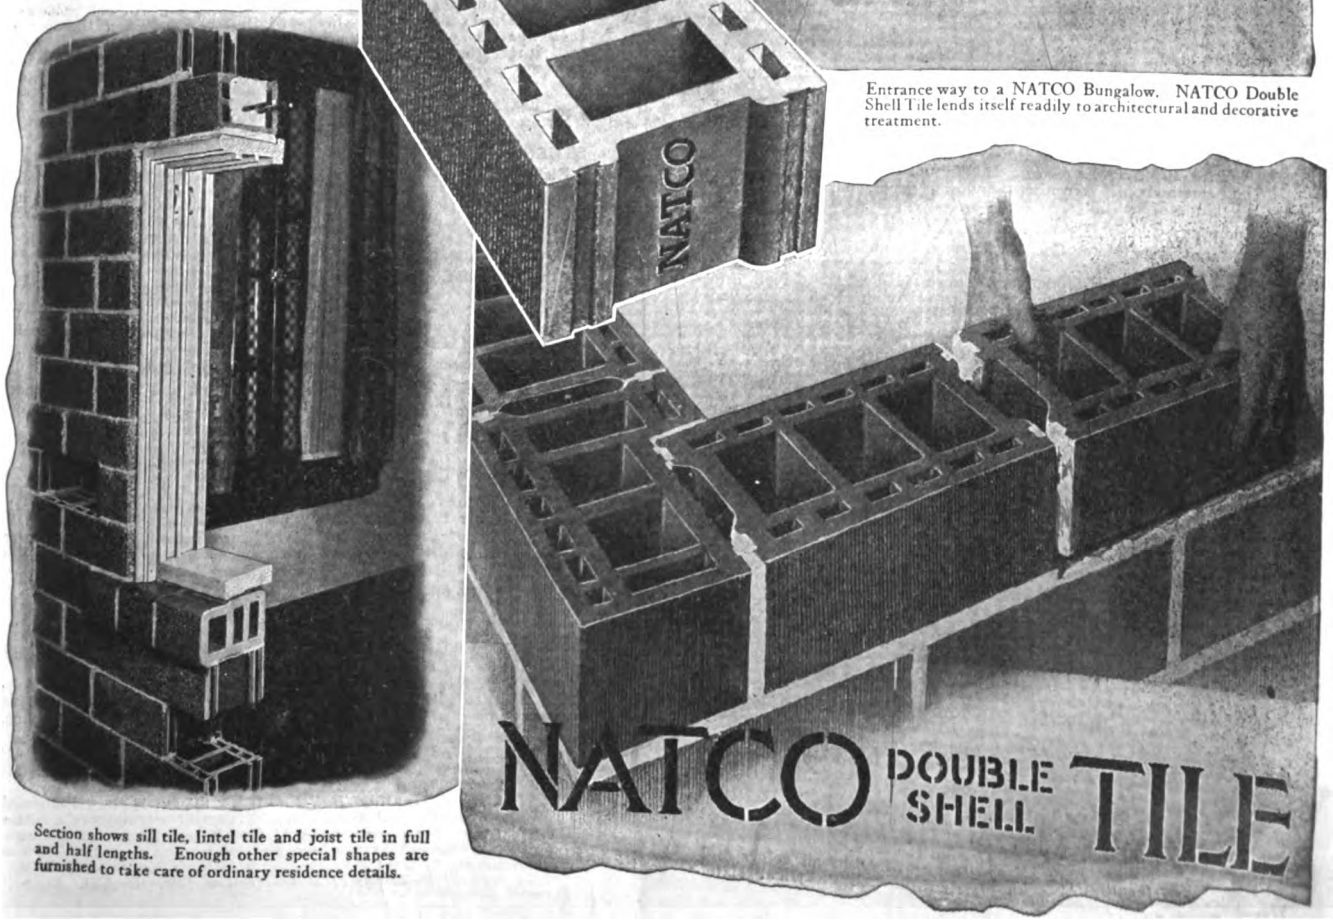
Individuality, Beauty and Adaptability Account for its Growing Popularity



NOTE how well the illustrations demonstrate the attractiveness and practicability of Natco Double Shell Tile. The ample vertical and bed joints make it possible for the mason to spread on the mortar quickly and easily. The moisture stop at each end of the tile in combination with the double shell construction eliminates through mortar joints and prevents heat, cold and moisture from penetrating through the walls.

Special tile in full and half lengths take care of lintels, sills, corners, window and door openings, joist and soldier courses, water-tables, etc., and readily adapt themselves to any distinctive architectural or decorative treatment.



Write for further information about NATCO Double Shell Tile—a building material easy to lay and install, with every advantage of ordinary hollow tile construction coupled with a flexibility, beauty and lasting satisfaction found in no other material on the market today.

NATIONAL·FIRE·PROOFING
·COMPANY·

1429 Fulton Building
PITTSBURGH, PA.

Entrance way to a NATCO Bungalow. NATCO Double Shell Tile lends itself readily to architectural and decorative treatment.

Section shows sill tile, lintel tile and joist tile in full and half lengths. Enough other special shapes are furnished to take care of ordinary residence details.

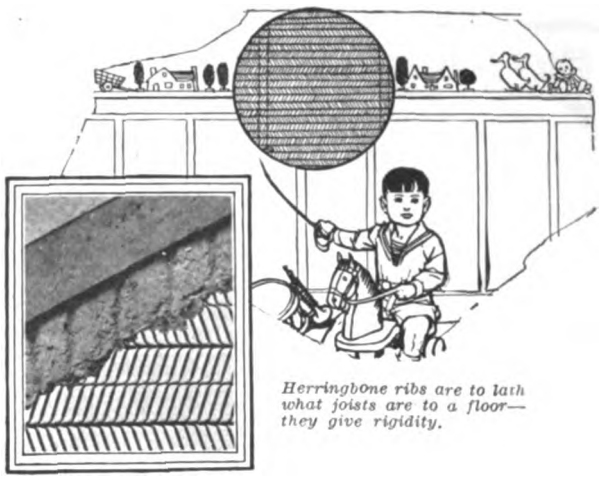
Rev. W. T. Elsing's Residence, Lakewood, N. J.
Insulated with "Quilt," as per letter below:

De Witt Memorial Church, New York, March 10, 1908.

"I built a house last summer in which I used your Sheathing 'Quilt' under the shingles and also between studding. I sheathed all the rooms with half-inch tongued and grooved boards, and decorated the walls with sanitary and Japanese crepes. The result is, I have a cheaper, warmer and more beautiful house than I could possibly get by using laths and plaster."

W. T. ELSING.

Make Your Houses Frost-proof by insulating them with



Cabot's "Quilt"

IT is cheaper to *build* warm houses than to heat cold ones. A cold house will *waste* enough coal in two winters to pay for enough Quilt to make it warm for all time. Quilt is not a mere building paper, but a thick, matted lining of cured eel-grass that is *twenty-eight times warmer than common* papers. It will make your house warm in winter and cool in summer, cut down your doctor's bills and keep the whole family comfortable. It will never rot or distintegrate—lasts forever—and is fire-retarding. A full investigation will cost you a postal card—which will bring you a sample and the proofs, with name of your nearest agent. Will you write now?

SAMUEL CABOT, Inc., Manfg. Chemists, Boston, Mass.

Also Cabot's Creosote Shingle Stains

342 Madison Ave., New York — 24 W. Kinzie St., Chicago

Herringbone ribs are to lath what joists are to a floor—they give rigidity.

Protects Bearing Walls from Fire

When *they* go the house goes. Construct your home with the bearing partitions protected with metal lath and plaster.

Herringbone spans sixteen inches. It is designed for standard stud spacing. Its use in a home means safety.

The increase in cost is but a small fraction of the increase in value.

Send for illustrated literature.

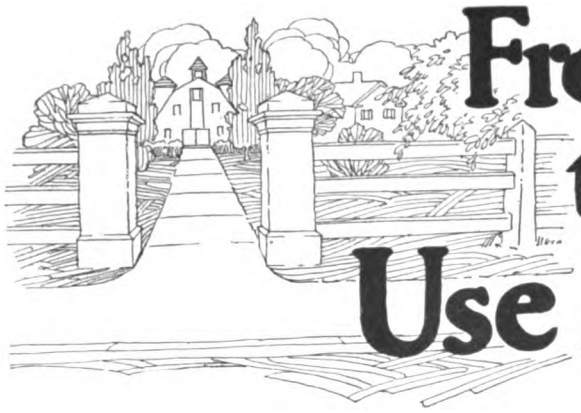
Koehring Dandie Capacities

4 cu. ft. mixed concrete—gasoline. 7 cu. ft. mixed concrete—steam and gasoline. May be equipped with power charging skip, low charging platform automatic water measuring tank, and light duty hoist



KOEHRING DANDIE MIXER

Don't mis-judge this mixer by it's price

It sells well within the price range for light mixers—and that is just where you may think it represents about the same value to be expected in mixers at that price. No! This is a light mixer of extraordinary dependability and long service. It is built in big quantities, every part standardized. That's what keeps quality up, and price down. It is Koehring engineered and Koehring constructed, the same as the big paving mixers, and big heavy duty construction mixers. ***Dependability*** is the greatest thing you can buy in a mixer—and here it is as it has never been before in a light mixer. You will save yourself money on many a job, if you will write for the Dandie Catalog. Write today.

From Gate Posts to Garage Use Alpha Cement

and give your customers the most substantial, permanent and economical improvements that can be built.

The cement dwelling below (drawn from a photograph of a house at Syracuse, N. Y., built by Hueber Bros.) is fire-safe as well as beautiful and comfortable.

A cement driveway keeps people out of the mud. A cement barn holds its value and keeps the farmer's stock clean and healthy. A cement silo is a fine investment for him.

See the Local ALPHA Dealer

These and a score of other permanent improvements are described helpfully in the ALPHA CEMENT Construction Handbook, 104 pages, illustrated. Get a copy of this valuable book from the local ALPHA dealer and use it in your conferences with property-owners about their new buildings and improvements. If you don't know who the nearest ALPHA dealer is, write us, mentioning *Building Age*.

Why MAPLE outwears STONE

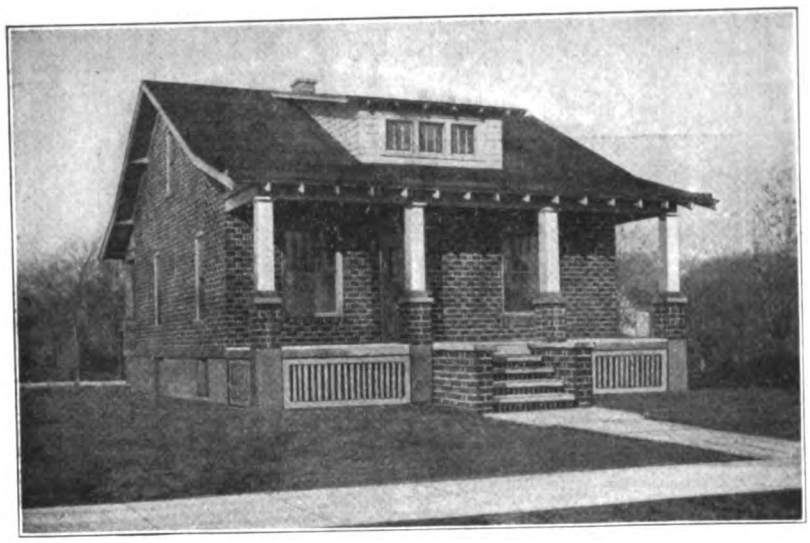
Every shoe in the thousands that strike a stone sill, grinds off its toll of fine particles in an unchanging friction. But Maple builds up its own resistance to wear, because each passing foot increases the polish on this hard-fibred, tight-grained wood, making it smoother and smoother.

That is why Maple surpasses all other woods and all other materials for flooring. Because of its individual characteristics, Maple is used for floors in every good home, office, school, church, apartment, public or industrial building.

Architects, engineers, contractors, builders—all who desire to give their clients the finest of counsel and service, will say "Floor with Maple." Wherever wear is essential or beauty desired, it is the wood to choose. And to be sure of the grade and quality you should have, see that it is flooring produced and guaranteed according to the rigid inspection standards of the Maple Flooring Manufacturers Association.

MFMA flooring is made from the climate-hardened, slow-growth Maple of Michigan and Wisconsin—the source of the world's finest Maple for floors.

Kindred woods of Maple are Beech and Birch, produced by the same high manufacturing standards. This trio of flooring woods offers a variety and versatility of surface finish which will satisfy any client you may have.



MAPLE FLOORING MANUFACTURERS ASSN.
1055 Stock Exchange Building, *Chicago*

The letters M F M A on Maple, Beech or Birch flooring signify that the flooring is standardized and guaranteed by the Maple Flooring Manufacturers Association, whose members must attain and maintain the highest standards of manufacture and adhere to manufacturing rules which economically conserve every particle of this remarkable wood. This trademark is for your protection. Look for it on the flooring you use.

THIS is one of the many Ideal wall homes built in Alton, Ill. The Alton Brick Company increased the amount of brick used in home building by 1000%.

This Trade-Mark stands for—

Quality—
An honest product, honestly advertised.

Responsibility—
A reputation for honorable, prompt and efficient business dealings.

Service—
A material of proven integrity with a record of ages of service.

The Common Brick Industry *of* America

1308 SCHOFIELD BUILDING
Cleveland, Ohio

The Ideal Brick Hollow Wall

400,000 Brick Used Where Only 40,000 Would Have Been Used

Here is just one example from many hundreds we can show you. What has happened in Alton is happening all over the country.

"Common Brick Mfrs. Assn.
Cleveland, Ohio

Gentlemen:

We are enclosing herewith photographs of some of the buildings that we now have under way using the Ideal wall. We have been able to get this construction in almost every type of building.

The best part about this is that all of these buildings would have been frame had we not gotten after the job. You will note all but two have brick foundations. We think in the future we will be able to get the foundation under all the houses. We find the 12½-inch brick wall can be extended to a 14-inch wall, without using any more brick, labor or mortar. This gives two larger air spaces and makes a most excellent foundation wall.

Very truly yours,
ALTON BRICK COMPANY
(*Signed*) Eben Rodgers, *President*"

The kind of buildings that Mr. Rodgers had been putting up range from a small private garage to bungalows, fine two-story houses, and store buildings. Not only are the walls built of eight-inch Ideal All-Rolok walls, but all of the buildings except two rest upon fourteen-inch Ideal foundation walls. These are the first jobs done in Alton in years in which brick has been used in the foundation.

This Book Thoroughly Describes Ideal Wall Construction

The Ideal Brick Hollow Wall is thoroughly described in "Brick, How to Build and Estimate." The new, third edition, 72 pages, is not only a complete manual of bricklaying, containing estimating tables, detail drawings and hundreds of valuable suggestions, but it includes a complete section on Ideal wall and architectural drawings of every detail necessary to carry out this construction. This is a hand book worth many times its cost for every builder. Special price 25 cents.

For general specifications, see SWEET'S ARCHITECTURAL CATALOGUE, Page 458, 16th Edition; Page 389, 15th Edition.

OAK long ago proved its genuine dollars-and-cents economy for all types of floors—in apartments, churches, schools, offices, factories, warehouses, institutions and public buildings, as well as homes.

Everybody agrees that Oak Floors are the most beautiful, but many prospective owners who need a heavy traffic floor are often unaware of the great saving afforded by their durability, sanitary and easy-to-clean features.

In educating the public to the truth about Oak Floors, builders render a high service—influencing prospective owners towards their best interests. A service doubly appreciated later on.

A special thickness (3/8-inch) for overlaying old floors should be remembered on remodeling contracts.

Also that a building with Oak Floors usually brings 25% or more on sale or rental, making a wise investment as well as an economy.

BEFORE YOU BUILD OR REPAIR CONSULT US WE HAVE WHAT YOU NEED

J. H. PATTERSON COMPANY
FREEPORT, ILLINOIS

Dec. 21, 1921.

U. S. Materials Company,
Chicago, Ills.,

Gentlemen:

After the contractors had applied several jobs of the new process Elastica, we had some difficulty in disposing of the balance of our stock of old process Elastica, because, as one contractor explained, he was through manufacturing his stucco on the job. He no longer wished to fuss with barrels, drums, mixing tanks and hydrometers. Another contractor said "Let the manufacturer do the manufacturing and I'll do the applying." This is the concensus of opinion among our contractors.

We now wouldn't consider handling anything in the Magnesite stucco here, except "Complete in a sack Elastica."

Yours very truly,

J. H. Patterson Company

PHONE 43
IOWA CITY, IOWA.

Jan. 12, 1921.

U. S. Materials Company,
Weed Street & Sheffield Ave.,
Chicago, Ill.

Gentlemen:

Our Exterior Stucco Mechanic tells us he has been working with magnesite stucco for three and a half years, and that he thinks Elastica is the best stucco on the market today. He states that he has applied it in forty-seven towns in Iowa, and is always glad to be called to a town where he can get Elastica. This mechanic has applied three carloads of the new process "Complete in a Sack" Elastica for us the past six months. He has not returned a sack as unsatisfactory and states that he is making more money at the same price per yard since using Elastica exclusively than he ever did before.

Yours very truly,

HAWKEYE LUMBER CO.

"Attention Mr. F.W. Langtry, Sec'y."

Dear Sirs--

Replying to yours of the 19th inst. would say that Elastica "complete in a sack" is very much more desirable in every way as compared with the old method of adding the liquid chloride.

It makes a decidedly easier proposition to handle from the dealers' standpoint, and the contractors and consumers seem equally delighted with the change. We feel sure it will prove quite a help in marketing this material.

With kindest regards we beg to remain,

Yours very truly,

NoKol is on the Underwriters Laboratories' list of approved appliances.

NoKol is in use in more than six thousand homes in all parts of the country.

NoKol belongs in every modern home— and fits any type of heating plant

Heating comfort was made actual by NoKol, just as lighting comfort was made actual by electricity. NoKol belongs in every modern home just as electricity belongs in every modern home.

NoKol heat is automatic, controlled by a thermostat. The temperature in a NoKol heated home does not vary, no matter what the weather is, or how rapidly the temperature outside may rise or fall.

NoKol uses only the amount of fuel necessary to maintain the temperature desired. Much of the time during the changing weather of spring and fall, NoKol uses only a nominal amount of fuel. NoKol is economical in operation.

NoKol rids the home forever of the dirt, discomfort, and drudgery of coal heating. It does away with all furnace attendance, coal dust, and ashes. NoKol burns kerosene, with a sootless, odorless flame.

Installing NoKol is a simple matter. The grate bars are removed and the NoKol burner is set in place of them. Connection is made with the fuel tank, the necessary adjustments are made, and NoKol heat is ready to turn on. No alteration of the furnace is made, whether it be a steam, hot air or hot water plant. The whole job requires less than a morning's work.

NoKol is the greatest single element of comfort a home can have. The whole story of NoKol will gladly be sent to anyone requesting it.

Get Your Reservation NOW
for the
Own-Your-Home Exposition

New Building tremendous in New York and Chicago

Vast building operations are already under way. Others of equal magnitude are planned for the Spring and Summer.

America's families are fast coming out of the war shell. The huge revival of home building indicates that they **mean to get** them.

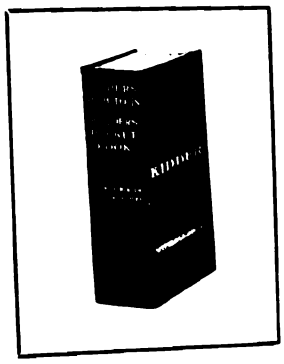
Keen interest in building

Men throughout these two metropoli are consulting builders and architects as to the best materials and devices for their particular needs. The Own-Your-Home Expositions in the Coliseum (Chicago), March 25 to April 1, and the 69th Regiment Armory (New York), April 22 to April 30, promise a bigger attendance and transaction of more business than last year—or ever before. Interest, now, is at fever heat.

Rush your reservation at once—or wire for full information

Practically all of last year's exhibitors will be represented this year. There is some room still at both the 69th Regiment Armory in New York and at the Coliseum in Chicago. Space rates are **low.** Both buildings are excellently suited for displays of elaborate or moderate pretensions.

But get your reservation in **now**—before it is too late.



Write, wire or telephone immediately for full information.

Practical Helps for the Builder

How often during the past few months have you wished for some good book on architecture or building to help you on some job? Wouldn't some of these new books have saved you more than they cost?

THE NEW KIDDER
Architects and Builders Pocket Book

Everyone in the Building field uses "Kidder's Pocket Book" and this new edition is larger and better than ever. Prof. Nolan and the other authorities, who have worked with him in the revision and rewriting of the various chapters, have described the latest improvements in the methods and equipment.

They have quoted from many authentic sources as well as giving results obtained in their own daily practise. Every item has been carefully checked and rechecked to see that it is technically correct and the aim throughout has been to present clearly and concisely, and in the least possible space, all the information that is likely to be required by the architect, builder, structural engineer, draughtsman, or contractor, including data for estimating the approximate cost.

The New Kidder has 1,900 pages of text, over 1,000 specially prepared diagrams and numerous tables. It is furnished in flexible binding with gold edges. Price $7.00.

Dalzell's Homes of Moderate Size

A collection of photographs and plans of distinctive, but inexpensive suburban and country homes following the Colonial, Italian and English architectural styles, and arranged accordingly. Selected for their artistic merit and adaptability to the needs of the average American family. There are photographs and floor plans of 55 dwellings and one country club. They have all been built recently and architects and real estate operators who have bought it say it is the best collection of medium sized houses they have seen. 160 pages, 9x12 inches, 300 figures. Cloth, $4.00.

Distinctive Country Homes

A collection of 100 plates of exteriors, doorways, gates and windows and floor plans. They range from the small house for a suburban plot to the more pretentious villa, with a good selection in all cases. 100 plates, 10x12 inches in heavy envelopes. Price $4.00.

Arthur's Home Builders Guide

A treatise for those about to build, covering the selection of the site, the planning of the rooms and proper materials to use in construction.

Contents by Chapters: The "Lay" of the Land. The Planning of the Home. The Big Four. A Firm Foundation. The Framework. Covering and Adorning the Frame. The Bungalow. Brickwork. Cement Stone—and Mere Stone. Lath and Plaster. Sheet Metal Work. The Interior Finish. Plumbing and Gasfitting. Ventilation. Heating and Lighting. Painting. Finish Hardware. An Analysis of an Ideal Plan. Tornado Construction. Wind Bracing. 144 pages, 5x8 inches. Cloth, $1.00.

Italian, Spanish and French Plates

An interesting collection of exteriors, interiors, gates, etc., of churches, palaces and other buildings. 80 plates, 9x12 inches, in manila envelope. $1.00.

Arthur's Estimating Building Costs

A book giving short cuts for estimating materials, output of labor and costs for all kinds of building work. The tables are especially reliable.

The book begins with the excavation, and ends when the house is finished. The chapters are: Excavations and Piling, Concrete, Brickwork, Stonework, Plastering, Metal, Roofing, Painting, Plumbing and Heating, Miscellaneous includes Hardware, Electric Wiring, Tiling, Bonds, Tables, Rafters, Cisterns, Weights, Comparisons of Cost Between Brick and Frame Buildings; Hints on Drawings. 228 pages, 4½x7 inches, 29 figures, 91 tables. Flexible Fabrikoid, $1.50.

Hick's Specification Blanks

For frame or brick buildings. Arranged to cover all the work apt to be called for in erecting residences, churches, schools and other small public buildings in various sections of the country. 12 pages. Paper. Six for $1.00.

McCullough's Practical Structural Design

A complete system for the design of beams, floors, girders, trusses, columns, walls, foundations, footings, etc. The big feature of the book is that no knowledge of algebra or higher mathematics is necessary to understand the explanations, for all calculations, etc., are presented in the form of the ordinary arithmetic that every builder knows. The book contains the most approved practice of up-to-date offices and is profusely illustrated. 320 pages, 6x9 inches, 200 figures. Cloth, $3.00.

Joslin's Estimating the Cost of Buildings

A systematic treatise on factors of costs and superintendence, with important chapters on plan reading, estimating the cost of building materials, and on system in the execution of building contracts. 205 pages, 6x9 inches. Cloth, $1.00.

Kidder's Carpenters' Work

Every carpenter and building contractor will find this volume an unfailing reference book. It has been revised and enlarged by Prof. Thos. Nolan and gives detailed explanations of the latest approved methods of building construction and superintendence with numerous diagrams. 931 pages, 7x10 inches, 830 figs. Cloth, $7.00.

Kidder's Masons' Work

A new and enlarged edition of this standard work which gives detailed information regarding the best modern practice of masonry construction, including foundations, handling difficult soils, fireproofing, plain and reinforced concrete, etc. 966 pages, 7x10 inches, 628 figs. Cloth, $7.00.

Kidder's Trussed Roofs and Roof Trusses

Describes nearly every type of roof construction commonly met with in buildings, wooden and steel trusses for different spans and building requirements, computing the loads, drawing the stress diagrams, proportioning the members and joints to stresses, etc. 294 pages, 7x10 inches, 306 figs. Cloth, $3.50.

Otter's Furniture for the Craftsman

Practical instructions and dimensioned working drawings covering the construction and finishing of practically all the articles used in the furnishing and equipment of the modern home, porch and grounds, with hints on upholstering. 308 pages, 6x9 inches, 297 figs. Cloth, $2.00.

Hick's New Builders' Guide

This standard book has just been revised and brought thoroughly up-to-date by the addition of much new material. It authoritatively covers masonry, hollow tile, estimating, roof framing, etc. Recommended by experienced men as the best modern text book for apprentices and journeymen. Full of practical "short cuts."

Contents by Chapters: Layout of Site, Excavating, Sheet Piling and Pumping. Shoring and Underpinning. Stone Masonry. Water-proofing Foundation Walls. Concrete Construction and Forms for Concrete Footings and Foundation Walls. Brickwork. Hollow Tile, Construction and Costs. How to Do Stucco Work on Metal Lath, Brick and Wood Lath. How to Lay Out and Build Fireplaces. Chimney Design and Construction. House Framing. Roof Framing. Mitering Planeers, Mouldings, etc. Carpentry and Construction Kinks. Metal Ceilings and Walls. Estimating Quantities of Materials. Estimating Labor on Carpentry. Estimating Brickwork. Short Cuts in Estimating Forms, etc. Tables. 360 pages, 4½x7 inches, 300 figs. Flexible fabrikoid, $3.00.

Hick's Estimators' Companion

The rules, tables and cost data on every branch of the building trades given in this pocket book will save you many times its cost. Well indexed. 218 pages, 4x6 inches, 92 tables. Cloth, $1.00.

Jobbing Work for the Carpenter

A book of time and labor saving methods, showing the shortest and most practical way of doing over one hundred special jobs. 277 special drawings are used to show each operation. The explanations are so clear that anyone who can use tools will have no difficulty in doing such things as constructing a work bench, building a saw horse, making and fitting doors, window frames and sashes, crating furniture and other household goods, cutting doorways through partitions, making counters, desks, bookcases, drawing boards, show cases, picture frames, regular, extension and rope ladders, fences. 273 pages, 6x9 inches, 270 figs. Cloth, $2.00.

Colwell's Kinks for Builders

A practical manual on carpenters' work, foundations, cement and plaster work. Worth many times its cost to the carpenter and builder. 160 pages, 5x7¼ inches, 116 figs. Cloth, $1.00.

Williams' Stair Builders' Guide

A treatise on the construction of straight flight, platform, cylindrical and elliptical stairs, explaining the theory and practice so the average building mechanic may understand it, with examples of work ranging from the simplest to the most complex forms. 256 pages, 6x9 inches, 360 figs. Cloth. $2.00.

Laying and Finishing Hardwood Floors

Covers the tools required, the laying of the floor, preparation of the surface, the painter's work, different varieties of finish, relative cost of floors and finishes, suggestions as to estimating. 50 pages, 5½x7¼ inches. Cloth, 50c.

ATLAS PORTLAND CEMENT

A Basic Material

THE first and oldest of permanent building materials was stone. It bore in itself tangible proof of having endured for ages—a satisfying promise of future long life. With it man built those structures he wished to endure, changing the stone only in shape to fit necessary building requirements.

TODAY man takes the earth's raw material, crushes and grinds it to impalpable powder; measures and proportions exactly its chemical and physical properties, standardizing the result; fuses it at more than white-hot heat; regrinds it; mixes it with sand, rock and water on the job, and produces permanent stone—at a cost lower than that necessary to quarry, shape and place in the same position natural stone.

Concrete construction has become practically universal because of four factors: its ease in handling under most unusual conditions, its suitability to almost any type of construction, its permanence, and —its economy.

The last quarter century has spread nation-wide the gospel of concrete. During that same time Atlas Portland Cement has deservedly been called "the Standard by which all other makes are measured."

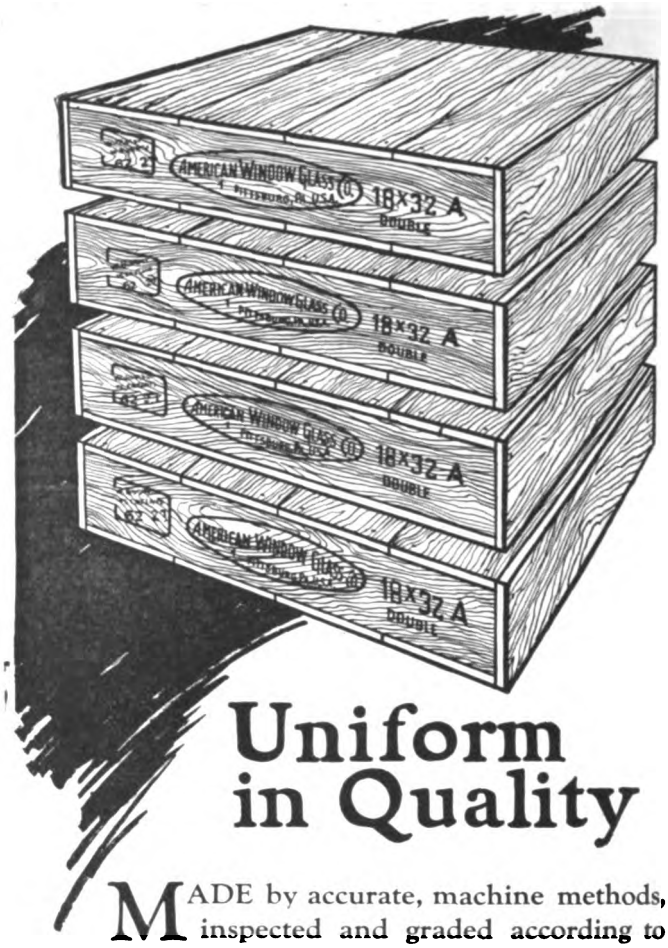
Why It Pays You to Install Kernerators in the Homes You Build

YOU contractors know that to be successful home-builders, your houses must please the women. That's why each year a growing number of new houses are built, Kernerator-equipped. No other feature in a home affords housewife or maid so much convenience and comfort as the Kernerator—the modern system for the sanitary disposal of household waste.

The Kernerator consists of a brick incinerator, built into the base of the chimney when the house is erected, and a hopper door located in the flue on the first floor. It takes care of all household refuse—rags, sweepings, wilted flowers, broken crockery, tin cans, garbage—**without cost,** for no commercial fuel is required. Unsightly garbage cans are entirely eliminated.



The Kernerator should be specified in the plans before construction begins. After a house is erected it is almost impossible to make a satisfactory installation, because in most cases the chimney flues are not large enough or are not properly located.

Write for our interesting literature giving complete information regarding the Kernerator. Also see page 1906, Sweet's 1921 Catalog

Kerner Incinerator Co.

1027 Chestnut St. Milwaukee, Wis.

KERNERATOR
Built-in-the-Chimney

Uniform in Quality

MADE by accurate, machine methods, inspected and graded according to **fixed standards, American Window Glass Co. products can always be depended upon to be uniform in quality, in thickness and in strength. Open one box or fifty of the same grade and weight, and every light will match every other. A second shipment will match the first.**

Highest Standards

First, second and third quality are comparative terms. The grading standards used in American Window Glass Co. factories surpass any others in use in the United States. Our "A" quality lights (seconds) are hardly distinguishable from "AA." Our "B" quality (thirds) are practically as clear as ordinary second grade. And for your protection the grade marking is branded on the end of every box — make sure that this marking has not been changed.

See Sweets Architectural Catalogue for details of our grading standards.

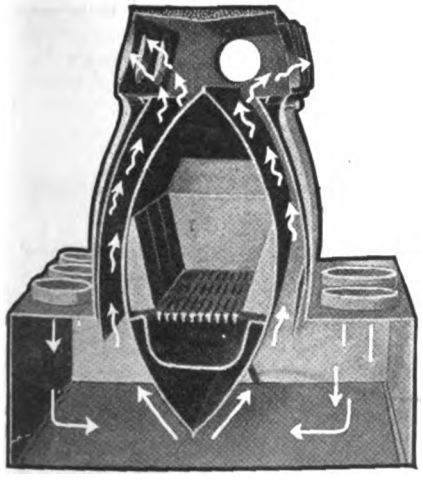
Fresh Wholesome Healthful Heat



—the kind that every home-owner wants

Merely to fill a house with "hot air" doesn't solve the question of home heating.

That home is best heated which is supplied with clean, pure, fresh air that is gently warmed without contamination with gases and fire poisons. Such is the heat furnished by the

"FARQUAR" SANITARY HEATING SYSTEM

This cut shows how the FarQuar Furnace is scientifically designed to gently warm the cool, fresh air instead of rendering it lifeless and devitalized through superheating.

Old fashioned heating ideas are totally disregarded in the FarQuar System of Heating and Ventilating. And the development of the FarQuar System was not a matter of opinions, but of proven facts. Every part in the construction of a FarQuar Furnace is the result of demonstrated principles which have proven their soundness for nearly twenty years.

High Grade Sales Representatives Wanted

In every locality there is at least one man who is always looking for better things to sell. This man is willing to listen and learn by facts, not theory. And having learned through satisfactory proof, he has sufficient faith in himself, in his fellow-men, and in what he sells, to make a success of his efforts.

That's the man we want to meet, for the story of the FarQuar Method of Heating and Ventilating will appeal to him.

If you're that man, and can prove it, write us.

The Sargent Auto-Set Bench Plane

Every carpenter should have a Sargent Auto-Set Bench Plane in his kit. It is a true, clean and fast cutting tool that will not chatter on the most difficult job.

The Auto-Set feature means a big saving of time. You can remove the blade for sharpening and replace it in exactly the same position without re-adjustment. The clamp and cap are in one part. There is ample handle room. Made in six sizes. Smooth or corrugated bottom.

If you are interested in fine tools, you should have the Sargent Book of Planes, which fully describes the Auto-Set and other Sargent Planes. A copy will be sent you free on request.

ROCBOND
Exterior Stucco

Over
$11,000,000,000

This staggering amount of money must be spent (says an authority) if the existing construction shortage is to be overcome in 1922.

Some part of this business belongs to you

Just how much, depends on you. Business won't *just come* to you. You must have something to offer. Dealers in Rocbond Exterior Stucco have something to offer — something tangible — something proved thru 9 years of use.

Thousands of Rocbond homes scattered over more than 26 states are golden tongued salesmen for the dealer in Rocbond.

The growing number of dealers who handle Rocbond have 12 active, profitable months,—for Rocbond works as well in winter as in summer. And we back every dealer with efficient co-operation and sales helps.

For *your* own advantage permit us to send you some interesting facts about the seasonal advantages of Rocbond—the all year 'round stucco. We have a place in our healthy organization for representative dealers. To drop us a postal puts you under no obligation.

KNAPE AND VOGT

Garment Carriers

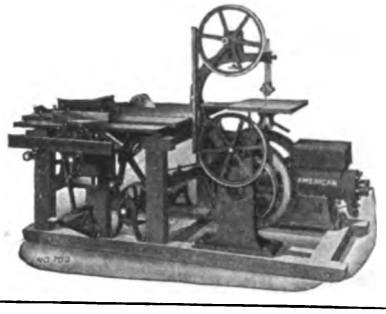
modernize homes

Send for Full Details Today!

Knape & Vogt Garment Carriers modernize homes because they provide a proper place for the family wardrobe. Order prevails, the life of good clothing is lengthened, garments are free from moths, and the selection of clothes is made easy.

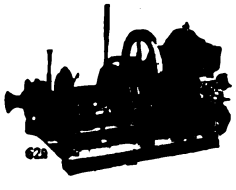
In homes about to be built Knape & Vogt Garment Care Closets actually save money in construction costs. Overhead dimensions are cut down without reducing sizes of rooms. Smaller closets; but closets that will hold more garments and keep them in perfect order.

Architects and builders who do not know the Knape & Vogt System are not giving their clients the benefit of the latest ideas in home conveniences.



How It Works:

Knape & Vogt Garment Carriers are full nickeled, durable and efficient. They operate smoothly on a roller bearing track. The clothing hangs in perfect array. A touch of the fingers brings the whole wardrobe into the room—a touch returns it to the closet. Easily attached to underside of closets or back wall and door casings. For old closets as well as new. Made in lengths 12 to 60 inches.



KNAPE & VOGT MANUFACTURING CO.

An "American" Contractors' Portable Variety Woodworker with 20-in. Band Saw

Take Your Shop Right on the Job

Do what a great many other carpenters and builders are doing—take an American Contractors' Portable Variety Woodworker on the job and have the equal of a complete mill right at your elbow.

Those vexing delays and the costs of running back to the shop to do this or that are eliminated when there's an "American" on the job. Each one of its fourteen machines (all in one unit) are high grade woodworking machines—the equal of any single machine. You will actually save money on every building contract that has an "American" on the job.

NOW IS THE TIME FOR PORCH PROFITS

WHEN you talk porch screens—and now is the time to make them—install portable panels which lock together and close in the open sides of the porch.

To assist you in pointing out to your prospect the simplicity of construction and installation of screened porches, we have prepared a Blue Print of a Porch Plan which we will send free for the asking.

Screened porches are money-makers for you. Due to its metallic coating, a special process exclusive with us, PEARL is longer lasting, hence most economical, besides being the most sanitary and beautiful.

Insure your workmanship and customer loyalty by specifying PEARL and make sure of getting the genuine by looking for our round red tag on each roll and the two copper wires in the selvage—our permanent mark of identification.

Call on your local dealer or write direct for samples and literature if you're interested in screen material.

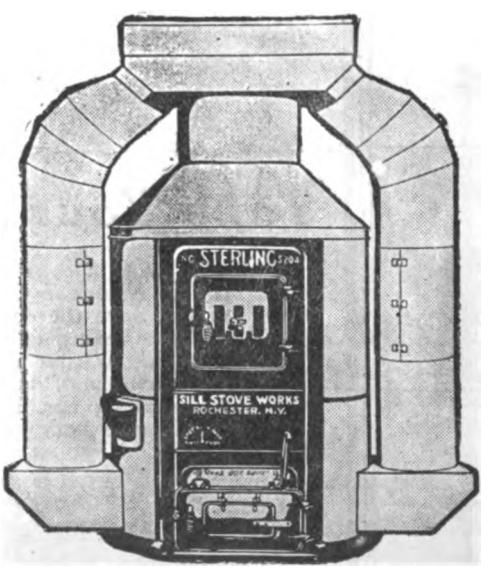
Address Dept. "C"

The Gilbert & Bennett Mfg. Co.

New York Georgetown, Conn. Chicago Kansas City

PEARL is made in Regular Grade (12x13 mesh) and 14, 16, 18, 20, 24 and 30 mesh; also Extra Heavy Grade (14 mesh only)

The best hardware dealer in your city sells "PEARL"



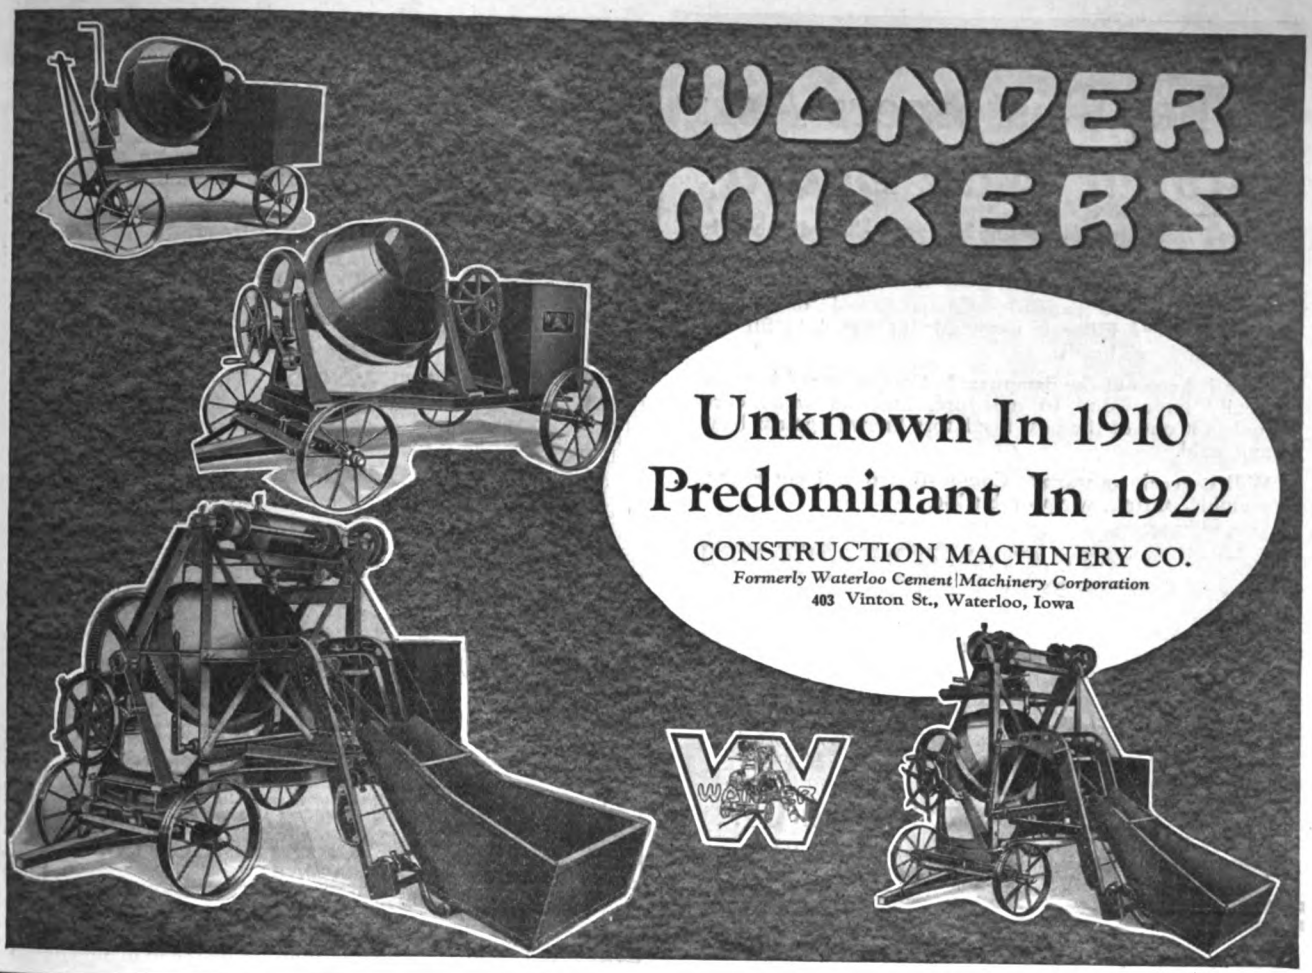
A Warm House in the Coldest Weather!

THE bleaker the weather, the more you enjoy a glow of warmth as you enter the front door. And the bleaker the weather, the more people appreciate the N. P. Sterling Furnace. For it heats every room in the house with a current of genial warmth. It doesn't burn a lot of coal; it is of modern, efficient design, built of good materials, with fine care. Two pipes flank the furnace. They draw the cool air down out of the rooms, and make way for the warmth that rises from the big fire-pot. It isn't a lot of work to install a Sterling; there is just one pipe and one register.

N. P. Sterling Furnace

The One Register Furnace

HERE is a furnace that is built to last. There is not a cheap feature about it. Everything that goes into its making is the best to be had. For instance, just look at the grates—the big water chamber (moist air is best to live in)—see the way the joints are made so you can't get a bit of ash dust or coal gas or wood smoke in the house. It's a fuel saver, too. Actual tests show that it gives out more heat from less fuel than any other furnace. It's a quality proposition thru and thru, built to **give real service.**



Before you install any heating plant, be sure to investigate the N. P. at the reduced prices.

What Customers Ask *About Wall Board*

Does it take any decoration? Compo-Board does. It takes any of the popular coverings—wall paper, burlap, canvas; or it may be painted or kalsomined.

Does it require panels? Compo-Board does not. **Compo-Board Filler** is especially prepared to fill the joints and nail heads.

Does it keep out the dampness? Compo-Board is practically impervious to moisture, and its wood core makes it one of the best insulators known against heat and cold.

Will it crack or warp? Compo-Board will not crack, crumble, shrink, warp or buckle.

Compo-Board

Trade Mark

The Wood Core Wall Board

is the only wall board that has ALL of these advantages.

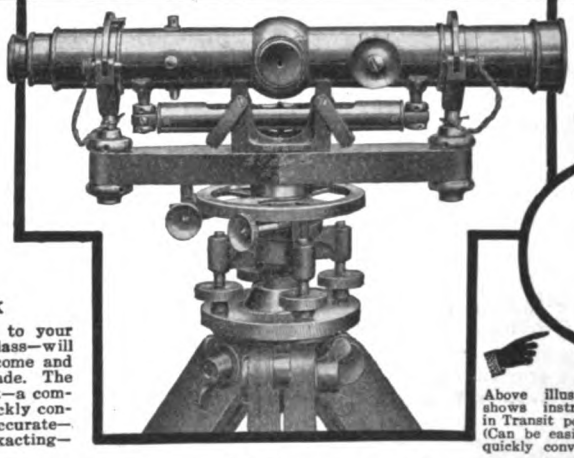
At last—A steel basement window that costs less than wood

TRUSCON STEEL BASEMENT WINDOWS

Truscon Steel Basement Windows are made in 2 standard sizes, 3-lights wide for 10x20" and 10x12" glass.

Home-builders have always wanted an indestructible basement window like this. Why install perishable wood sash when you can get Truscon Steel Basement Units that will last as long as the foundation? They swing in at the bottom like ordinary sash but they never warp or stick. The Truscon Steel Unit is ready to install—no fitting sash to the frame—no hinges and locks to buy—no extras at all. The window affords 50% more daylight than wood sash and double contact weathering makes it stormproof. The whole window is as easily installed as the wood frame alone in any type of foundation.



Get figures from your dealer before you build your house this Spring.

New Tape Hook

Makes

Pullman Sash Balance

The 100% Window Device With No Increase in Price

The new Tape Hook makes it possible to fasten or unfasten the tape from the sash while sash is in place. No fussing with the stop; no mars or scratches; no refinishing; no lost time.

Pullman Sash Balances are easy to install and cost less than cords and weights. They are cheaper, not alone in first cost, but also because any carpenter can fit 2 to 4 windows with Pullmans while he would ordinarily fit one with cords and weights.

Pullmans eliminate box frames too. That alone saves you real money and makes a tighter, better construction.

Pullmans are made of pressed steel, are entirely incased and constructed in 3 UNITS, K, L and M, adaptable to any kind of sash. Operate easily and quietly; last indefinitely, in fact are guaranteed for 10 years.

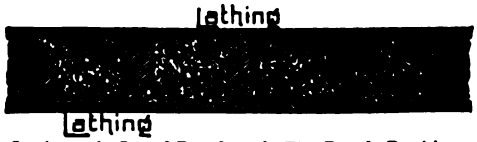
THE SIDNEY MACHINE TOOL CO.

SIDNEY, OHIO

Section of Outside Wall of House, Showing Wool Between Studding.

Mineral Wool for Building



Mineral Wool has superseded all other materials used for similar building purposes because it does "a great work at little expense." A house lined with Mineral Wool has an indestructible, fireproof and vermin-proof guard; it protects the entire household. In the winter time it keeps the cold air out, facilitating proper heating and economy in fuel. In the summer it keeps the heat out.

This material, being of fibrous, inelastic composition, acts as a deadener and muffles all sound. It is considered the best insulator material on the market, making it a perfect refrigerating machine.

Mineral Wool makes life-long friends of all its users. If you are skeptical as to its power, let us demonstrate. We can prove all claims. Write us to-day.

A New and Better Coal Chute

Naturally you seek convenience and durability when you buy a coal chute. Here's one with steel side plates that form a hopper when chute is opened as shown in illustration. Note the steel shield that protects the house from damage. Door automatically locks when shield is lowered. Make sure you get the Stover. Ask for it by name.

STOVER
COAL CHUTES

Here are a few advantages: 1. Weatherproof. 2. Cannot be pried open from outside. 3. Can be opened and closed from cellar by chain. 4. Chain both unlocks door and lets it down easily—without jar or damage. 5. Operates easily and quickly. 6. Well finished cast iron frame, black enameled. Write us for literature and prices.

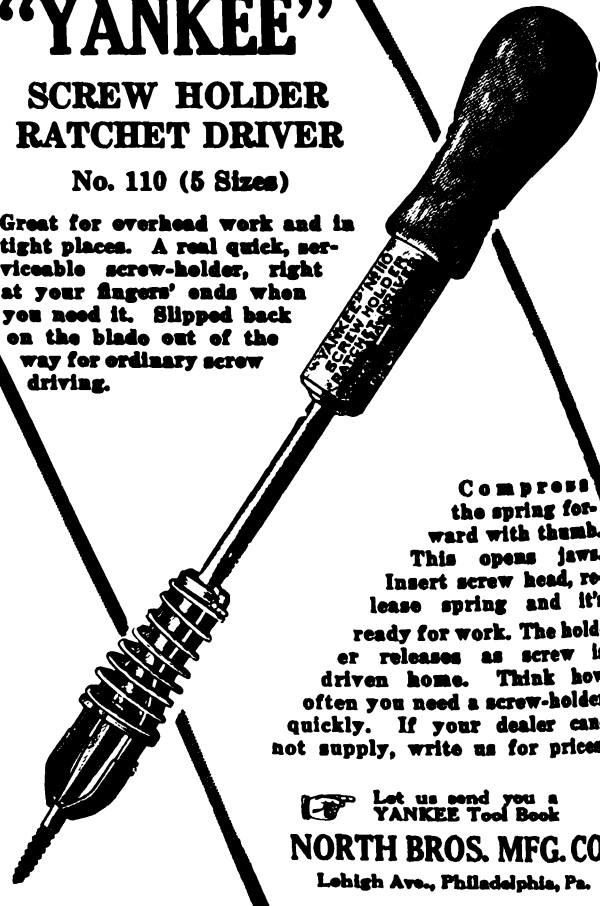
FORSTNER Labor Saving AUGER BIT

Bores Any Arc of a Circle

Many New Uses

The Forstner Auger Bit, unlike other bits, is guided by its circular rim instead of its center, consequently it will bore any arc of a circle, and can be guided in any direction regardless of grain or knots, leaving a true polished surface. Takes the place of a chisel, gouge, scroll-saw, or lathe tool combined. For core boxes, fine and delicate patterns, veneers, screen work, scalloping, fancy scroll twist columns, newels, ribbon molding and mortising.

Try it and be convinced.



The PROGRESSIVE MFG. CO.

8 MEN CAN'T STICK IT

Improved Boring Machine

This machine is from new design, and no pains have been spared to make it a first-class machine in every respect. The spindle is made of crucible steel, has No. 2 Morse taper hole to receive chuck, and the bearings are of genuine babbitt metal. It has two stops to regulate the travel of the spindle, one in the head to adjust the downward stroke and one in the treadle for the upward stroke. Greatest length of travel of spindle is 6½ inches. Distance from center of spindle to column, 10". Table is 26" x 36". It is balanced and has a vertical movement of 21". Spindle is balanced by a coil spring attached to arm on top of frame, making it self-contained. The bracket that carries the driving pulleys has an adjustment of two inches, which is very desirable. T & L pulleys are 8" x 3" face, and should make about 800 revolutions per minute. If belt gets loose, loosen screws in front of bracket and by turning set screw on top till your belt is of the right tension.

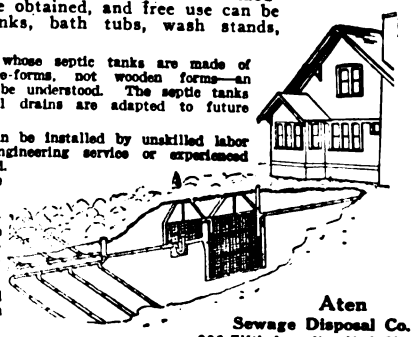
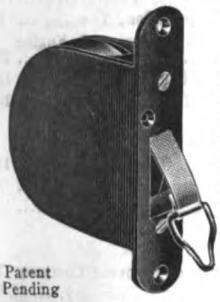
SEWAGE DISPOSAL



For Homes, Factories, Schools, Clubs, Hospitals, etc.
With the Aten System all the comforts of a modern city building are obtained, and free use can be made of toilets, sinks, bath tubs, wash stands, laundry tubs, etc.

It is the only system whose septic tanks are made of concrete reinforced wire-forms, not wooden forms—an advantage which should be understood. The septic tanks as well as the sub-soil drains are adapted to future extensions.

It is a system which can be installed by unskilled labor without the need of engineering service or experienced supervision in the field.
Is adapted to single buildings or groups.



Our many years' experience enables us to give valuable service to Architects and Builders without obligation.

Send for our illustrated catalog No. 10 which tells all about it.

For 50% Build The Hollow Wall Way For 50%

Like a thermos bottle—Warmest in winter, coolest in summer. Fireproof. Everlasting.

Cheapest, best and most Perfect way known to the Building World.

The reason the most wall can be built for the least money with our forms is—because they are STRONGEST — LIGHTEST —SIMPLEST and most PERFECT—and the price of a complete set can be saved on one small job.

NORTH MILWAUKEE WISCONSIN

CORTRIGHT METAL SHINGLES

Lightning yearly blots out 10,000 homes or structures of some sort.
Sparks on roof yearly totally destroy 7,500 more.

Cortright Metal Shingles are an absolute protection from both.

Let's tell you more about them—their durability, for instance.

You can build a home like this. Consult your retail lumberman. ***Ask him to show you Long-Bell Plan No. 2062. If he hasn't it, write us. There are 60 other homes in Long-Bell service.***

LONG-BELL

Trade Marked LUMBER

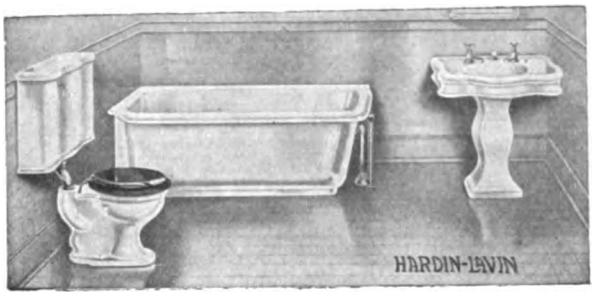
When you think of LONG-BELL Lumber, think of more than good Lumber—Think of what that lumber will build—

Homes of Charm and Distinction

Long-Bell service includes something more than the manufacture of good lumber. It includes a home plan service that is distributed to retail lumber dealers to make it easy and convenient for home builders to select appropriate designs and to obtain estimate of cost.

Go to your retail lumberman. Ask him to show you Long-Bell home plans. Choose a plan that will fit your needs and then ask the lumberman to give you an estimate of the cost of that home complete. You will be surprised at the economy, as well as the beauty and convenience, of Long-Bell homes.

Any retail lumberman, who has Long-Bell plan service, can give you an estimate of the cost of a home like this. Ask for Long-Bell Plan No. 1293. There are 60 others.



Build with Lumber, the least expensive material you can buy today. To be assured of obtaining lumber of uniform high quality ask for lumber bearing the LONG-BELL brand.

The Long-Bell Lumber Company

Red-Lead that won't harden in the pail

You can appreciate what that means. No loss through hardening. No time lost in using. Because of its extreme fineness and purity, this red-lead remains soft and workable in the pail.

Dutch Boy Red-Lead is pure red-lead in paste form. It contains pure linseed oil. The addition of more linseed oil brings it down to a paint consistency. Brushes out easily, giving a smooth, even coat. Painters like to work with it. Dutch Boy Red-Lead also comes in liquid form—ready to use.

A coat of Dutch Boy Red-Lead is like a coat of armor on any metal surface. It renders such surfaces rust-resistant.

Color pigments may be added to Dutch Boy Red-Lead for finishing coats.

Specify this famous red-lead for all metal structural work and for railings, gutters, flashings, metal roofs, etc.

Write to us for Painting Helps No. 19.

As pictured with floor plans, in The Home of Beauty, and as actually built by Mr. J. C. Breckon, of Denver, Colorado.

First Floor

Second Floor

The Use of Plan Books Increases Home Building

THE contractor who uses plan books containing good architectural designs invariably finds them of great value in securing building contracts.

When presented a variety of commendable designs and interior arrangements, the home builder is able to find just the type of house he wants. The complete plans and specifications are ready for immediate use so that the last obstacle to your commencing to build is removed.

The preference for face brick houses, because of their beauty, permanence and ultimate economy, is continually spreading. Hundreds of working plans of homes shown in the Association booklets have been distributed. The public evidently like and build these houses, and you will find them popular with your clients. Mr. J. C. Breckon, of Denver, says of his home shown above: "The house has caused much favorable comment. I consider it an extremely artistic little house."

WRITE FOR THESE PLAN BOOKS

The Home of Beauty
Presents floor plans and perspectives of fifty designs, by competent architects for practical and artistic homes of a wide variety of types. Complete working drawings obtainable for every house at nominal cost. Price 50c.

Bungalows — Small Houses
are featured in 4 booklets of 3-4, 5, 6 and 7-8 room designs. Unique presentation of designs with reverse plans for each exterior and choice of 2 exteriors for each plan affords 184 house arrangements. Price 25c each, $1.00 a set.

Manual of Face Brick
A complete treatise, liberally illustrated, of all phases of face brick construction, explaining methods and presenting data essential to every builder. Supplemented with 31 house designs for which plans are available. Price $1.

The Story of Brick
A 60-page booklet handsomely illustrated, covering the whole subject of face brick, its history, structural merits and architectural possibilities. An effective "sales manual" which will help sell your service. Sent free.

"YOU are doing, in your present advertising, the most constructive thing that has been done for the Building Industry in the past twenty-five years.

"For the first time, public attention is directed to the very kind of construction that every good carpenter and conscientious contractor *wants* to do and *will* do, when the people of the country are aroused to the price they pay for the cheap construction practices which are daily becoming more common."

Creating a Demand for Better Built Homes

THE above remarks, made by a prominent contractor and builder, whose business is largely house building in one of the large mid-western cities, refer to the Weyerhaeuser Advertising Campaign to prospective home owners, now running in such national magazines as The Saturday Evening Post, American Magazine and Literary Digest.

This campaign strikes directly at the real causes of house ills—for which the lumberman and the better class of contractors have been all too generously blamed. And the campaign is arousing people to a realization of the facts—as shown by the immediate response from all parts of the country.

Our advertising and literature is not intended as an instruction course in building. We do not pretend to teach carpentry to laymen. But we are stressing the importance of *good* construction and *good* houses, by contrasting actual examples of the kind of construction that pays and the kind that causes repair bills.

OUR purpose in this campaign is threefold. We want our products to deliver lifelong service. We know that an interest in better-built homes will lead to a wider employment of good craftsmen. We believe that it is time that prospective builders began to differentiate between the two kinds of competition.

As manufacturers of quality lumber for sixty-four years, we offer to the builders who demand *good* materials from which to do *good* work, ten different kinds of lumber for the varying requirements of house building—trade-marked in evidence of our belief in *right* material properly applied.

A BOOKLET, "The High Cost of Cheap Construction," outlining good construction practices, is being sent to prospective builders who answer our advertisements. We suggest that you send for your copy of it—or for such a supply of the books as you may wish to use in helping along this educational work among prospective builders.

"Good Houses" is another book which will interest good craftsmen. It deals with house design and the architectural possibilities of the wood-built house.

Weyerhaeuser Forest Products are distributed to the builders of the country through the more progressive lumber dealers by the Weyerhaeuser Sales Company, Spokane, Washington, with branch offices and representatives throughout the country.

WEYERHAEUSER FOREST PRODUCTS

The modern door vanishes

Every builder is constantly confronted with the space-saving problem. It is surprising how much space is taken up by hinged doors—space that could be used to good advantage. And when the building settles and the door sticks, it must be removed, planed off and refinished.

Vanishing doors, hung on *Richards-Wilcox* hardware, allow every foot of floor space to be utilized. *Richards-Wilcox* door hardware is so carefully and skillfully made that it provides a door which operates easily and noiselessly. The adjustable feature of R-W hardware eliminates sticking without worry or expense.

Every builder should have a copy of our new catalog devoted entirely to hardware for the home. Let us send you a copy. Ask for catalog J-4

Your prestige as a careful, conscientious builder will increase with every installation of *Richards-Wilcox* vanishing door hardware.

Your local hardware or lumber dealer should have Richards-Wilcox door hardware in stock. If not, our nearest branch will supply him with it

Richards-Wilcox Mfg. Co.

"A Hanger for any Door that Slides."

Signs of spring—and rust

AS you passed the little house around the corner on your way to the station this morning you noticed the plumber's wagon unloading pipes for repair work.

A block down the street you saw other patching up in process—

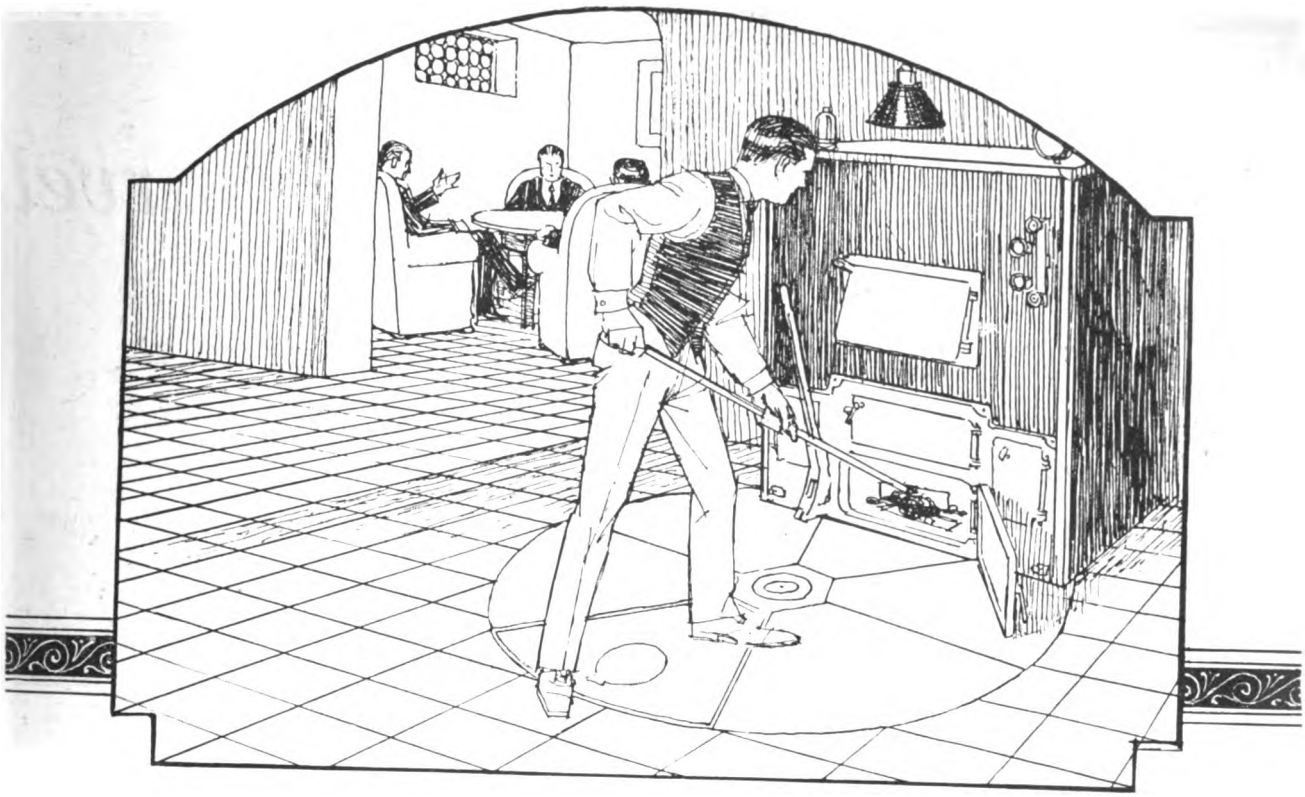
New gutters and leaders
New shingles
New boards in the front stoop, where rusty nails caused the old stoop to rot.

You noticed that the house would have to be repainted outside owing to unsightly streaks made by rusty water from leaking gutters, and you guessed that there probably would be some painting inside, too, made necessary by rusty leaks.

If *you* had built that house you would have told the owner he would *save* money in the not-so-long run by using—

Copper spouting
Copper flashing
Brass in the plumbing and hardware
Brass or Copper nails in shingles and exposed boards.

Architects and builders know that Copper and Brass are rust-proof—that Copper and Brass last as long as the house. They know, too, that these metals save the money of the man who *owns* the house as well as enhance the reputation of the man who *builds* it.



We are conducting a vigorous nation-wide campaign in The Saturday Evening Post, Literary Digest and other periodicals to inform the public on the economy of using Copper and Brass. We ask your co-operation

COPPER AND BRASS

RESEARCH ASSOCIATION

No Bother to Attend to Your Furnace

The cellar as clean as the rest of the house

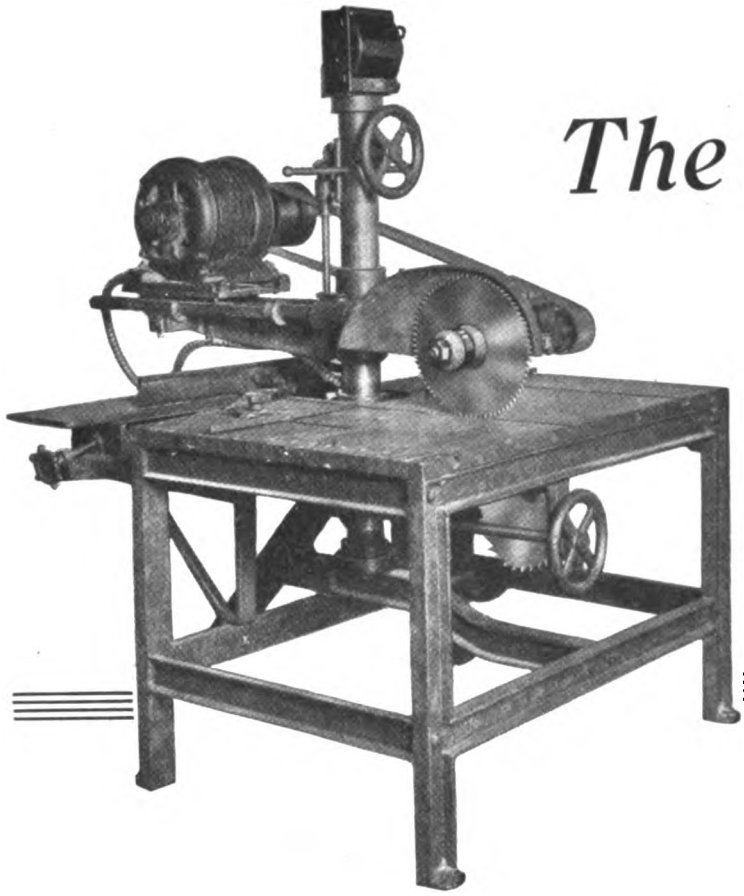
There is no use having unsightly ash cans beside the furnace. What's the use of shoveling dirty ashes, getting your clothes covered, and inhaling disagreeable, injurious dust?

That unpleasant job of taking care of your furnace can be changed to a simple matter of raking ashes into the can beneath the ash pit.

The Sharp Rotary Ash Receiver improves the looks, cleanliness, and usefulness of the cellar. There are no ash cans or ashes in sight. The cellar will be made liveable and attractive.

This device is practical, easy to install and operate. There is nothing to get out of order. Can be installed with five, eight or twelve cans, iron or cement top.

A hoist for removing filled cans is furnished as a part of the regular equipment.



Dealers, Builders or Agents desiring to sell this latest home convenience, write today for particulars about your territory. Selling connections rapidly being made everywhere.

Send for additional information.

SHARP ROTARY ASH RECEIVER CORPORATION

The Speed Marvel

Cuts your lumber at 1-5 the usual cost

Hutchinson Lightning Woodworker

Why pay good money for the usual old fashioned way of cutting lumber, when you can do it with the "Speed Marvel" at a fraction of the cost—and do a DOZEN OTHER THINGS on the same machine besides.

The "Speed Marvel" has marvelous speed for three reasons. 1st—lumber is quickly placed on table clear of all obstructions. 2nd—you draw the saw through the lumber, not push lumber against saw. 3rd—work is at all times visible.

The "Speed Marvel" is a many purpose machine. It will rip plank, cross cut, dado, rout, mitre, bore, rabbet, join, sandpaper, cut window sills, grind tools, gain out ribbon studs. Guaranteed to cross cut 8″ x 16″ beams and rip 4″ plank. Portable. Weighs only 790 lbs. Self contained. Motor is mounted up on the machine away from sawdust and dirt.

While doing this versatile work, it is turning time into money. You pay for the Speed Marvel whether you buy it or not. It will prove a wonderful investment for you.

J. VAN DYKE MILLER, TREASURER
WALTER A. HARN, GENERAL MANAGER

October 7th
1921

The Building Products Co.,
412 Stuyvesant Bldg.,
Cleveland.

Gentlemen:-

We are very glad to recommend the use of Blaw-Knox floor forms which you have installed for us on the Patrick Henry School.

These forms are perfectly rigid and give the best appearing concrete floors that I have seen.

Very truly yours,

THE DRUMMOND MILLER COMPANY

JHD:LW

By John H. Drummond

PRODUCTS OF BLAW-KNOX COMPANY

SECTIONAL STEEL BUILDINGS
Portable (permanent) buildings for light manufacturing, storage, field work, garages, and for housing men, materials, and equipment. 8' to 60' wide, any length.

CLAMSHELL BUCKETS
Single-, two-, three-, and four-line buckets for every class of service from the lightest rapid rehandling to the hardest digging and dredging.

FABRICATED STEEL
Bridges, buildings, crane runways, manufacturing plants, mill buildings, steel poles, trusses and all manner of construction requiring fabricated steel.

STEEL PLATE WORK
Oxy-acetylene, electric, and forge and hammer welded, as well as riveted steel plate construction and specialties of every description.

FURNACE APPLIANCES
Knox patented water cooled high-temperature furnace appliances for protecting men, materials and equipment. Sheldon gas producers. McKune system for open hearth construction. Mowry dolomite gun.

TRANSMISSION TOWERS
Steel towers for high tension transmission lines, lattiied and channel A-frames, outdoor sub-stations, switching stations, signal towers, poles, derrick towers, radio towers, etc.

STEEL FORMS
For every type of concrete construction: columns, factories, fences, foundations, houses, reservoirs, roads, sewers, sidewalks, streets, tanks, tunnels, walls, warehouses, etc.

SERVICE
Blaw-Knox Service is a part of every Blaw-Knox product. The engineering skill and experience brought to bear upon individual problems insures the adaptation of every Blaw-Knox product to meet the specific need of the customer.

answer to HIGH BUILDING COSTS

Blaw-Knox Flat Slab Floor Forms in use on the Columbia Graphophone Company Building, Baltimore.

Method of laying Blaw-Knox Flat Slab Floor Forms.

YOU also can profit by the time, labor and material (shoring and concrete) saving features of the Blaw-Knox System.

In his letter, Mr. John H. Drummond, of the Drummond-Miller Co., Cleveland, voices his frank opinion of Blaw-Knox Floor Forms—he has experienced and reaped the benefits of modern STEEL FORM application to his latest building, the Patrick Henry High School at Cleveland.

In a like manner—we can help you. Blaw-Knox Steel Forms for FLAT SLAB or BEAM AND JOIST construction, used in conjunction with Blaw-Knox Column Molds, will save you money.

Earnest co-operation and engineering advice from Blaw-Knox trained men will smooth out your problems. Shoring; form setting; pouring; dismantling and moving—all operations will work with clock-like regularity. Result—a finished building in quick time at a decided saving.

TO ALL BUILDERS—the Blaw-Knox System is a valuable help. Its employment will benefit you—and we're ready and anxious to help.

Ask About High Speed Alley and Street Paver

Digitized by Google

The triangular projection on each slab underlies the slots in the second course above, thus giving added protection where it is most needed. This is an exclusive, patented Vulcanite feature.

The darkest spots in this X-Ray view of Doubletite denote triple thickness.

The gray indicates the all-over double-thickness of Doubletite.

Why Do We Call It Doubletite?

BECAUSE it builds a roof that's double thick at every point. Doubly weather-tight—double protecton all 'round. And it's worth while remembering that no other medium-priced slab shingle has this important advantage.

Doubly beautiful too. Expensive Italian tile-like appearance. Unusual octagonal shape is pleasing variation from ordinary prepared roofings.

Won't curl in any climate—not even high, dry, windy sections.

Impossible to go wrong in applying. Lay four at a time. Automatic spacing.

Vulcanite Doubletite is one of three distinctive and exclusive Vulcanite roofing features, each of which is patented. The other two, Vulcanite Hexagon Slab and the Vulcanite Self-Spacing Shingles, are illustrated on this page.

In addition, the Vulcanite line includes a better roofing for every possible need. And bear this in mind: *No matter where you are located, we can promise quick delivery and low freight rates.* Factories at Albany, N. Y.; Franklin, Ohio; Anderson, Ind.; Chicago, Kansas City and San Francisco. Also conveniently located warehouses.

At your request we will send one of our large force of roofing experts to see you and explain the Vulcanite line in detail. Also, we will gladly furnish you with full-sized samples of Doubletite or any other Vulcanite Roofing. Communicate with our nearest office for detailed proposition.

Vulcanite Hexagon Slab

Highest possible quality. Considerably wider than ordinary slab shingle, insuring double thickness at every point. Patented design assures proper application. Can be applied directly over old shingles. Many dealers have developed profitable business in Hexagon Slabs for this use alone. Investigate this Vulcanite specialty.

Vulcanite Self-Spacing Shingle

Laid 4½ inches to the weather, Self-Spacing Shingles build a roof with three thicknesses everywhere except at slot. Each shingle fits snugly against shoulder of the next one. Rain and snow can't drive into roof boards. Write our nearest office for samples in standard and jumbo weights, in Indian red or gray green.

Fourteen days to alter plaster partition

Fourteen hours for the same work with Empire Partition.

EMPIRE Partition
PATENTED

Why the Equitable Building (N.Y. City) Was Equipped Throughout With "EMPIRE EXTENSIBLE STEEL PARTITION"

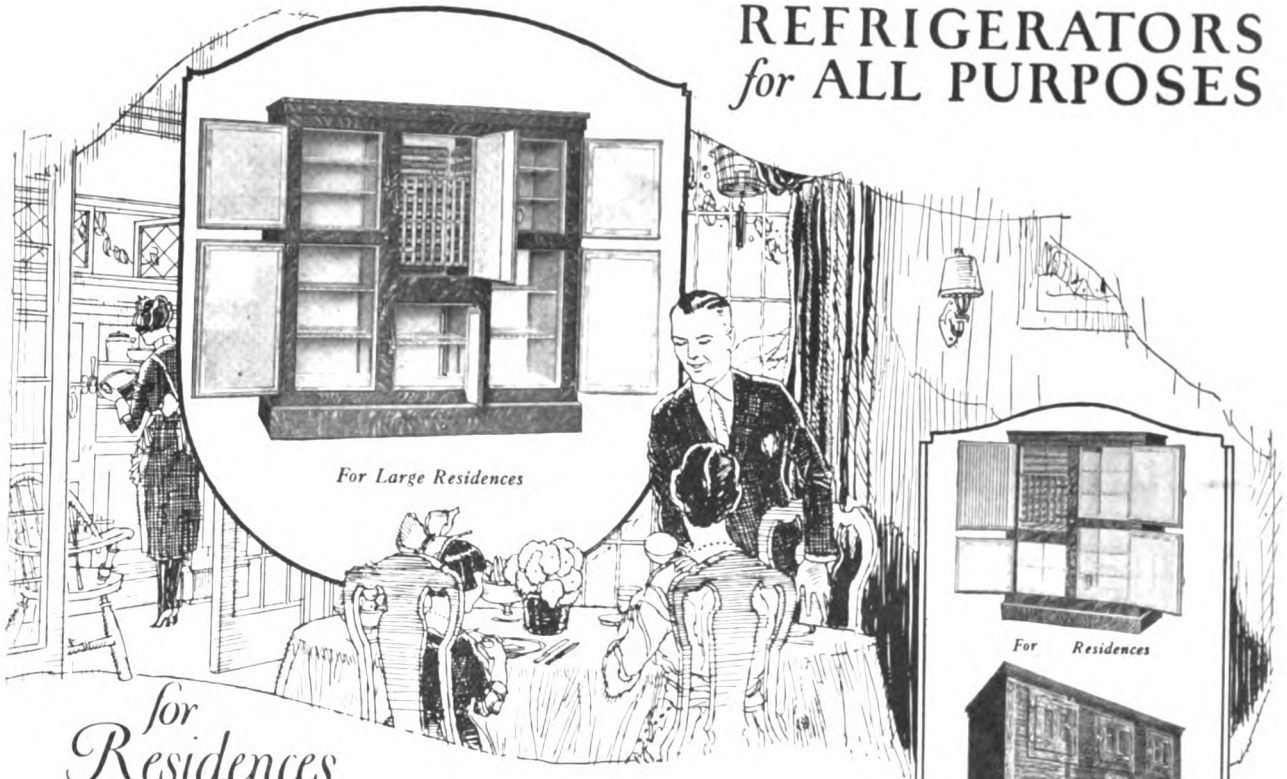
SPECIFICATIONS called for PARTITIONS that should be more flexible than plaster, more durable than wood. They wanted it to "take HOURS INSTEAD OF DAYS to dismantle" partitions already in place and to re-assemble them to suit the new space desires of new tenants moving in. Empire Extensible Steel Partition met every requirement.

Take only a few hours to erect—no dirt or confusion—portable—flexible and adjustable to any ceiling height—last practically a lifetime at no cost beyond the first cost—LOW COST COMPARING FAVORABLY WITH WOOD—here, at last, is the ideal steel partition. Finished in any baked enamel finish, such as Mahogany, Circassian Walnut, American Walnut, Olive Green, etc., etc.

Write for booklet and full details.

EMPIRE STEEL PARTITION CO.

COLLEGE POINT, N. Y.



"EMPIRE EXTENSIBLE STEEL PARTITION" is adjustable to any ceiling height, adjustment taken care of above lower cornice line, all material below that point being of STANDARD HEIGHT.

Fireproof

Saves on Labor

Many Finishes

Wears Forever

Warm in Winter Cool in Summer

Has Strength

and Remember, It Costs Only 5 Per Cent More Than Wood!

HOLLOW TILE is always used by builders as quickly as they realize this fact.

As our forests disappear, it is rapidly coming to the front to take the place of wood. You get a fireproof building at only 5 per cent higher cost.

It is the lowest priced of all permanent building materials.

Weighing only half as much as brick, it is strong enough to be used for load bearing walls up to four stories. It will carry ten times the weight ever imposed upon it in residence construction.

You will soon be using tile! Send for our free Builder's Manual and house plan folders. You can use them in your business.

121 Sizes of Window Frames Always Ready

ANY DEALER can supply 121 different sizes of Andersen Window Frames the same day they are ordered. Still that dealer only stocks 11 standard sizes. A glance at the above list shows how easily this is done by simply interchanging heights and widths.

The ability to deliver when needed a large number of sizes for a wide variety of uses is a distinct saving to both dealer and builder. This convenience and the time it saves is only one of the many advantages of Andersen Standard Frames over made-to-order frames.

All exposed portions of Andersen Standard Frames are of genuine White Pine—the wood that has for centuries withstood warping, rotting, swelling and shrinking in America's oldest houses. Accuracy of construction, and the use of White Pine, insure you that windows will always fit snugly yet slide easily in Andersen Frames.

Each frame is packed in two compact bundles containing seven units. These seven units can be nailed up into a complete frame, with pockets and pulleys in place, in 10 minutes. The small bundles, each weighing less than 20 pounds, are easily handled and require less storage space.

Write for Complete Information

An interesting book, giving information about Andersen Standard White Pine Window Frames and the economies of their use, will be sent without charge. Write for a copy.

THE BUILDERS' JOURNAL

NEW YORK, APRIL, 1922

BUILDING *OUR* HOME

PERHAPS at no other time in the history of our country has there been such a demand for houses as exists at the present time. The high rents, overcrowding, etc., due to the housing shortage created by the war, has made many people want a home of their own who would otherwise never have given it thought.

Bad as the housing cloud was, it had its silver lining and it is now being revealed in the wide interest taken in the possibility of owning a home.

The building of a home is a family affair; it is "Our Home" with all members of a real family. On the different pages of this issue the intending home owners will find many suggestions and practical hints that they can make use of when building their home, so that it will be more comfortable and attractive.

A Flower-Bordered Path Leading to An Inviting Front Doorway, Speaks Welcome to the Owners and Guests. Truly, "There is No Place Like Home"

As an indication of the widespread interest in home building, we need only refer to the large Own Your Home Expositions being conducted this month in Chicago, Cleveland, and New York, etc.

A great responsibility rests on the building contractors and architects of America to meet the demands for better standards of homes—we know they are able and willing to give real service to home builders.

The days when one watched the cellar being dug, the foundation being laid, the walls, floors, roof, etc., being placed, will always be remembered with pleasure. There are but few things in life more interesting than the pleasant adventure of Building Our Home.

Digitized by Google

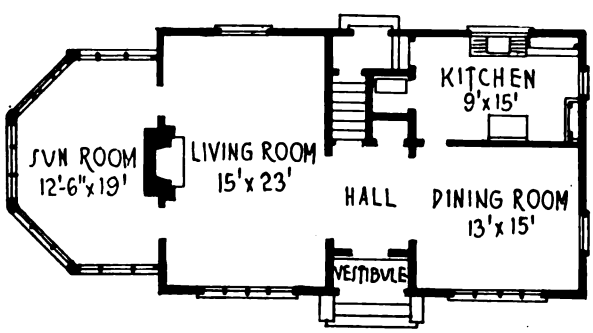
Will the House Architect's

The House as Pictured by the Architect

WILL our house, when it is built, look like the sketch? This is a question which is put to builders and architects by practically every intending home builder. Most people are unable to visualize a house from the plans or even a perspective sketch; they do not know whether it will be carried out in the same way.

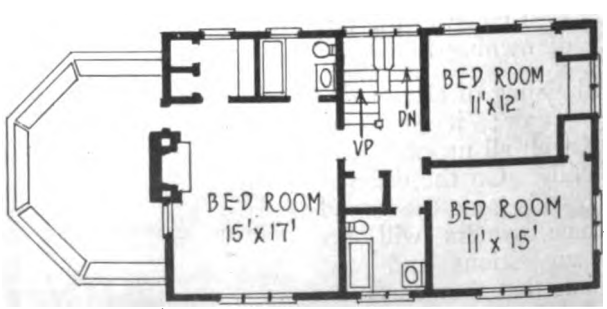
The pictures presented in this article illustrate how two houses have been built and they show conclusively that, with the exception of a few minor details, the houses look like the architect's sketches.

In the first sketch is shown the preliminary plans of a house for Mr. H. A. Rice, which was built at Malba, Long Island, New York. These were prepared by H. P. Knowles, a New York architect, for the Malba Estates Corporation, who were the builders.



It is interesting to make comparisons and note the few changes that have been made. On the second floor the triple casement window has been changed to two single windows. Likewise, gable windows have been placed in the attic. In this case, two additional bedrooms and a bathroom were placed in this attic. The picture of the completed house has awnings on the first floor, which hide the casement windows of the sun parlor quite a good deal, but they are identical with those shown on the sketch.

The second sketch was also prepared by the same architect and erected by the same builders. The actual photograph of this house shows that a change has been made in the front entry porch. A little extra ornamentation has been placed here, but in our opinion the architect's original sketch should have been followed, as the result would have been better.



Another change was made in the porch; an open porch was designed with flower boxes on the floor to serve as a rail, but for screening-in purposes the owners thought it advisable to use a bulkhead instead of the flower boxes. This has been arranged for screens for summer and sash for

The House Built and Occupied

First Floor Plan

Second Floor Plan

Digitized by Google

Look Like the Drawings?

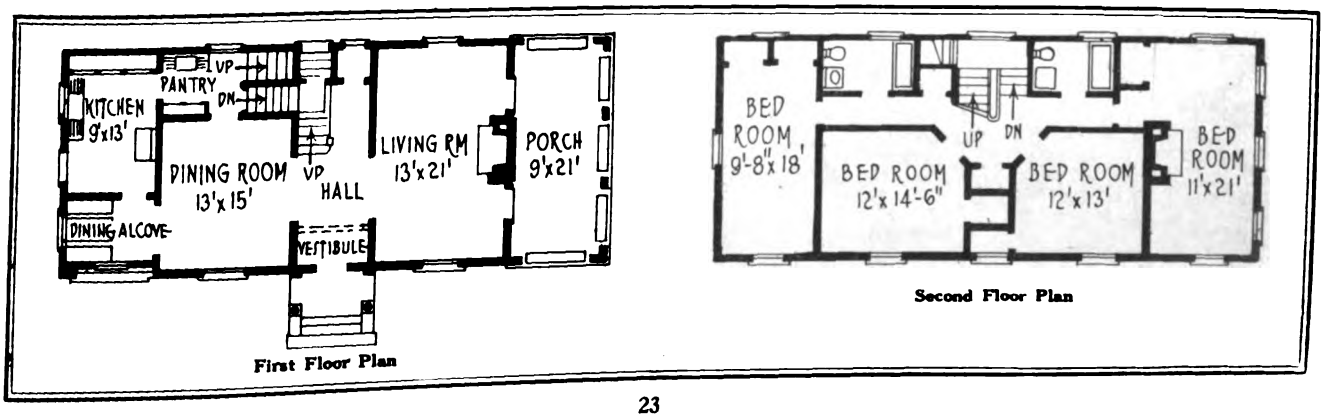
winter use. An entrance to this porch was also made in the centre space, which leads out to the garden.

Outside of these minor changes the plan has been faithfully followed and the house looks practically the same as the architect's sketch.

It is quite interesting to study both these houses and to see how every little detail was carried out. It shows that if a set of plans are followed the result will be exactly as sketched.

In the sketch and photo of the second house there is quite an innovation in the use of glass for the sides or cheeks of the dormers; this has the advantage of doing away with the tunnel-like effect to these dormers from the inside rooms. This gives light in the attic rooms. The same idea has been carried out by Mr. Ernest Flagg, the noted New York architect, in some small houses that he has designed and he is enthusiastic about the advantages gained.

The Sketch Prepared by the Architect



In some cases a model is made of the house so as to give the intending home builder an idea of exactly how the house is going to look. Quite often no perspective sketch is made, only plans and elevations. In this case one gets a rather poor idea of how the house will appear unless he has been trained by examining a number of houses under construction and their plans.

The most troublesome part of looking at an elevation of a house is the roof, this always looks very steep and top-heavy on the plans. When it is erected, however, the slant of the roof makes all the difference.

To obtain the correct proportion is a matter of experience only and it is safe to leave this to the architect rather than say it is too high and then have a flat looking roof. Should there be any doubt about whether a roof is too steep or too flat, simply have a small model made of the roof so that the proportions can be judged. It can be cut out of stiff paper and pasted together. It gives one an accurate idea of just how the roof is going to look.

How the House Appears When Erected

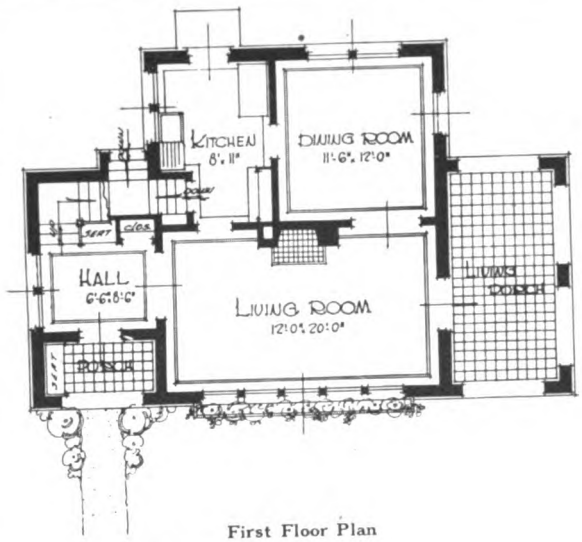
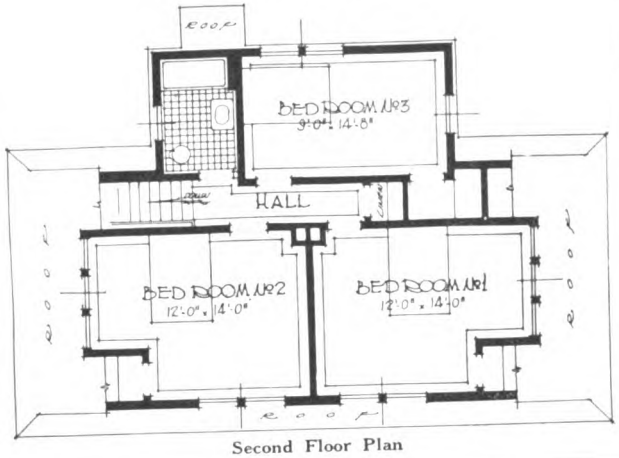
Modern Cottage



Six Room House Specially Designed for Building Age and The Builders' Journal

By R. C. HUNTER & BRO., Architects



SLOPING lines to the roof of this house add a certain distinctiveness to its design. This feature roof gives a very unique and pleasing appearance, as it comes down and extends as a wide hood across the entire front of the house just above the first story windows, a strong horizontal effect is obtained that tends to lower the height and increases the apparent length of the house.

This gives a front of good proportions that is not stilted and in no way suggestive of the four-wall-and-roof "box" that is so often characteristic of small two-story houses.

To further the pleasing horizontal effect the windows are arranged in groups, symmetrically placed. Most striking is the group of five large windows in the first

First Floor Plan

Second Floor Plan

Digitized by Google

story that centers in the living room opposite the fireplace, giving a most unusual wall treatment and making the room bright and attractive.

A flower box extends the full length under this group of windows, offering a tempting setting for geraniums and hanging vines, where they will show to best advantage, both from within and without.

The first story walls are of stucco on hollow tile, giving a most effective background for planting and lending a variety to the exterior in the contrast of both color and texture that the plain wall affords, in relation to the shingle walls and roof above.

One enters the house through a little porch that has an inviting seat, into a small square reception hall. The living room opens up well from the hall and the stairs are so placed as to give the greatest service with no lost space.

A dining room, kitchen and an attractive living porch complete the first floor. This porch has a cement floor and the openings are so arranged that the enclosing of the porch in the winter months is a most simple matter, giving another room that is delightful to live in.

On the second floor are three good size bedrooms and a bath. Closet space is not lacking. All of the bedrooms have group windows that give plenty of air and sunshine, making these rooms comfortable and cheerful, just what bedrooms should be.

As figured here this house would cost about $8,000 to build; this is a fair estimate for reasonably good construction throughout.

Complete working plans and specifications of this house in blueprint form will be furnished for a nominal sum by BUILDING AGE *and* THE BUILDERS' JOURNAL.

Quantity Survey

of Modern Cottage Design Shown on Preceding Page

THE quantities given are for estimating. All measurements are NET unless otherwise noted; areas given for such items as sheathing, flooring, etc., are net areas to be covered, with no allowance for matching, waste, etc. Minor outs have been disregarded.

SUCH items as clearing site, temporary work and protection, scaffolding and general equipment and supplies, have not been included. Such items as are marked "Unit," are to be estimated in a lump sum, following requirements of plans and specifications.

EXCAVATION

Riverside Bungalow

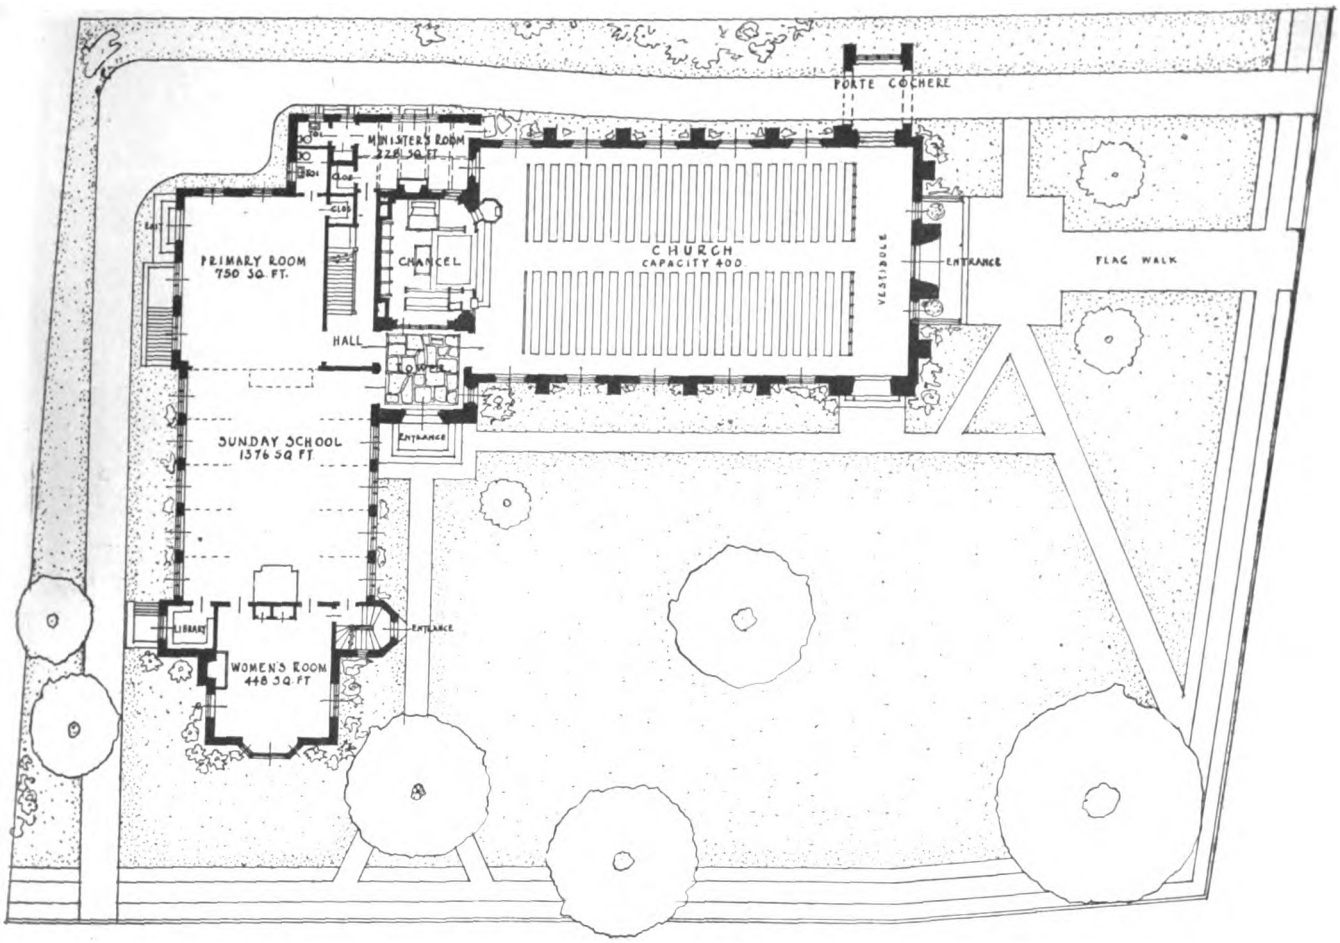
Novel House Plan with Front Facing Towards the River

WHERE the property is located that the best view can be had towards the rear, it is only common sense to plan the house so as to reap the benefit of this advantage of location. In the bungalow shown on these two pages this has been done. What is practically the rear of the house faces the street and the living room, with its adjoining large porch, faces towards the river.

This bungalow is the home of Mr. Amos Birdsell, and is located at Tom's River, N. J. It was erected from plans prepared by Heacock & Hokanson, architects of Philadelphia.

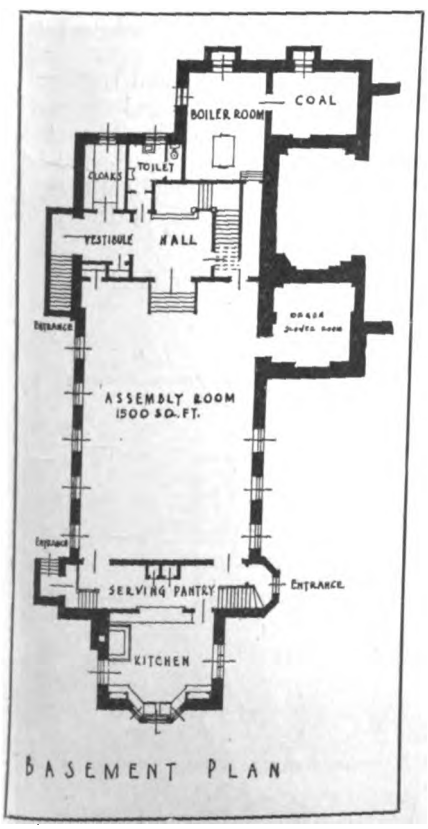
One enters the grounds from the street through an attractive pergola gate flanked on each side with a privet hedge along the street. A concrete walk extends down towards the river and parallel with it adjoining the front porch steps.

As will be noticed, there are steps leading into the rear entrance so that access can be had to the kitchen and also steps on the side leading to the main porch, from which one can enter the dining room or living room.



A garage is made part of the house and the design has been skillfully handled so as to give a pleasing exterior from the street side.

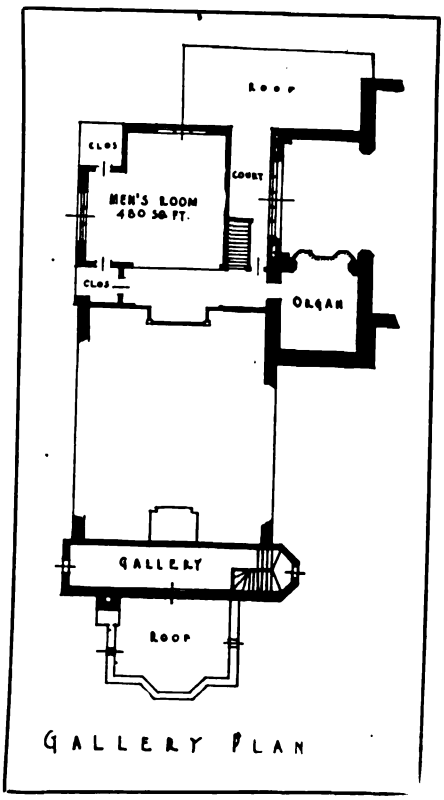
The construction of the house is frame covered with stucco, at the ground level there is a soldier course of red brick which gives just a little touch of color that is attractive. All the outside woodwork and trim is stained brown, also the roof shingles.



It will be noticed that the roof of the garage is flat. This enables the adjoining bedroom to have windows above the garage roof.

The service entrance is screened from the street by an ornamental latticed pergola. This in time will be covered by vines which will give all the privacy desired to the rear of the house, which in this case faces the street.

Digitized by Google



Plan of the Hugenot Memorial Church, Pelham, N. Y., and the Layout of the Grounds

The stability of a rubble wall depends upon the willingness of the stone mason to apply an axiom of his craft: "No matter what the size or shape of the space to be filled there is somewhere a stone to fill it." If the mason decided it will be wiser to trim a stone to fit the place than to spend the time necessary to find a stone which will just fit, the use of the hammer and chisel will trim corners off here and there. A stone which, to the unpracticed eye, appears hopeless will slip into its place easily.

A well-laid rubble wall should give the impression that its face is straight; small depressions or projections of the faces of single stones should not be considered. If several stones are so laid that there is a distinct depression or projected area in an otherwise straight wall it is evidence of poor workmanship. If joints are not of uniform width it is evident that the mason slighted the fitting of the stone. As stone is stronger than mortar the greater proportion of well-fitted stone the better the wall.

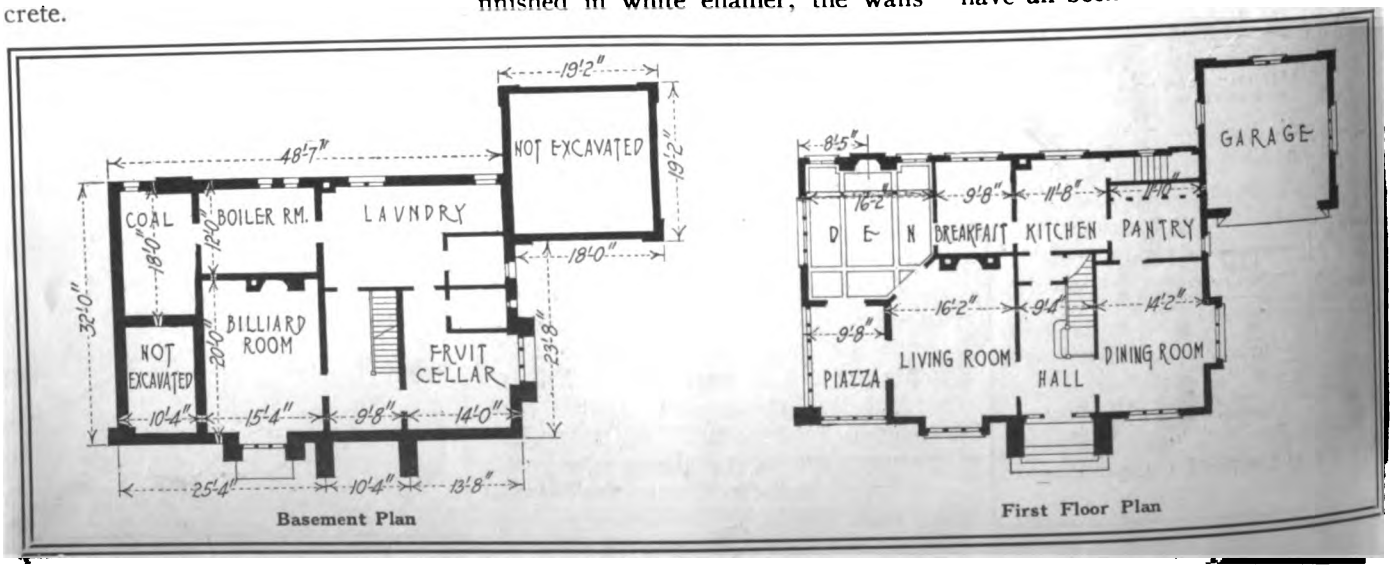
Attractive Canadian Home

Designed by J. A. THATCHER, Architect, Toronto

THE substantial and attractive looking home shown above is the residence of Mr. Marshall G. Flick. It is situated on Wells Hill Avenue, Toronto, Ont., Canada.

The house is practically of brick construction. Stone is used as an ornamental base for the brickwork. The face brick used is light buff Hilton pressed brick.

The second floor gables are also of brick and this is stuccoed over. The roof is covered with dark red Spanish tile. The steps and path, also automobile driveway are of concrete.



The treatment of the garage is rather unusual; it is linked with the house in a very attractive manner.

The floor plans presented herewith show how conveniently the rooms have been arranged. The dining room is finished in mahogany and, as our illustration shows, is paneled to a heighth of 6 feet, the walls above the paneling also ceiling are covered with canvas and painted with a frieze of conventional design.

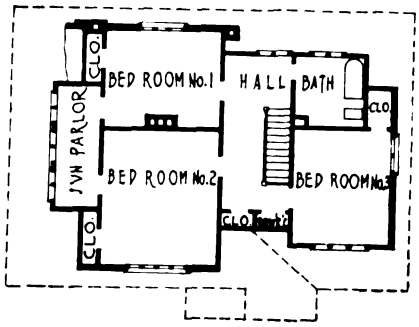
The living room walls are paneled off in the frames, the woodwork in this room is of birch which has been finished in white enamel; the walls have been painted a putty shade, which serves as an effective background for the pictures and ornamental candelabra chandeliers.

From the living room one has a glimpse of both the den and sun parlor. The den is finished in gum wood with a beamed ceiling and is stained light walnut, when treated this way gum wood resembles Circassian walnut. The sun room is trimmed in birch and finished with a light French gray enamel, the floor is of 6 x 6 inch red quarry tile.

On the second floor the bedrooms have all been finished in popular en-

Digitized by Google

ameled white. The bathroom wall to a heighth of 6 feet is covered with 3 x 6 inch white glazed tile, the floor being of 1-inch hexagonal white ceramic tile.



But little attention is usually paid to our cellars. In this house a large billiard room occupies a considerable portion of the space. The ceiling of the entire cellar or basement is lathed and plastered. The stairway to this basement is a regular staircase, finished in mahogany and white so as to be an attractive feature. The wood trim in this basement is all finished in white enamel, and it certainly makes a very handsome appearance. The basement also contains a built-in wine cellar, which we understand the owner will keep well guarded when he receives American visitors—they are apt to think that all of the beauty of the house is in the cellar!

View of Dining Room, Showing the Mahogany Panelling

FACE brick may be used in three possible ways, determined by the backing-up material employed. First there is the solid brick wall consisting of common brick backing with a face brick front. Of the strength, permanence and structural value of this construction, there can be no question. The cost is more than a frame house, to be sure, but some people prefer this mode of construction. On account of saving in painting, etc., some claim there is an actual economy in using the more expensive material.

Some object to a brick wall on account of dampness, but this can be easily overcome. The mortar joints sometimes absorb moisture and so does a porous brick and frequently there is sweating due to condensation of interior moisture on the cool wall. Either of these conditions may be completely overcome by the simple process of furring the interior wall surface; this is simply placing 1x2 wood strips on the walls, 16 in. apart on which the lath is laid. When the plaster is applied there is an air space between the brick wall and the plaster. This furring provides the air space that insulates against dampness and cold.

Second Floor Plan

Of course, for interior brick walls or where there is a wall between twin houses, the furring is not needed as there is no way for moisture to get to the brick. In using brick, care must always be taken that all exterior joints of the wall, especially the head or vertical joints, are solidly filled with mortar.

There is a possibility of efflorescence which sometimes appears in the surface of the brick wall when it has been subject to excessive moisture. This can be prevented to a great extent by omitting ledges and projections in the construction that permit the soaking of water into the surface of the brick.

Face brick may be used with a hollow tile backing in place of the common brick. The advantage of this type of construction is that there will be hollow dead air spaces which act as a heat insulation in much the same way as the furring does on the solid brick wall. Both methods insure a dry, warm wall.

Building Homes That Please

Information Intending Home Owners Should Give Architects and Builders in Order to Obtain the Home They Desire

By CHARLES G. PEKER, Architect

WHEN folks decide that it is time for them to build a home of their own, they begin to think about the little features that they would like to have included in this dream house of theirs: It is a surprising fact that although people have lived for years in a house of some sort, they overlooked some of the most important parts. They were just content with having a plain, ordinary affair to live in as long as they rented it, but when it comes to owning a home they begin to think of all the desirable features possible and want them included.

Now, the architect and builder desires to please their clients and to this end no little point should be overlooked in giving the people what they want. It is rather disappointing to the builder or architect who has strived his best to please his clients to hear them say: "Oh, I didn't want this. It is not what I was after at all. I forgot to tell you about it," and other little things of a like nature.

The writer, having been through this experience quite a few times, devised a system of questions to ask a prospective client, in this way obtaining a good idea of what is wanted.

The first thing, if you cannot visit the site, is to make a rough sketch of the lot, marking the street, the size, length and width, and the points of the compass, also marking the desired location of the house. If the lot is not level, this should be noted on the sketch and arrows pointing in the direction of the slope. Of course, a photograph would help.

Your possible customer has no doubt seen in some book or magazine a design of a house that pleases him. This will be something to start with. If the plans have to be filed, this must also be noted and a proper charge made for this extra work. Ask them if they want a house one story high, one story and a half, two story, etc. Discuss the advantages, etc., with them. If they are old people there are a great many advantages to be said for the one-story house, that is, the bungalow type. Impress upon them, however, that the same amount of room can be had in a two-story house at less cost, as the foundation and roof are similar.

The Construction

We now come to the style of the house that is desired. They will probably have their minds made up whether it is to be a frame house covered with shingles, clap boards, stucco or brick veneer, brick, hollow tile, concrete, or stone.

Some, perhaps, will prefer the latter as there may be some field stone on the property. Many people get the idea that because there are a few stones laying around their property, there will be enough to build a house. Make sure that there is plenty of stone before going in too deep in this matter.

Some prefer the first story of stone or brick with the second story in shingles or stucco or some combination of two or more of these materials.

Selecting a Suitable Design

Have the house design suitable for its locality. If the site is a hillside piece of property, a very artistic result can be had by selecting a design that will "fit" into the scenery. To place an ordinary bungalow on a hilly site with one end close to the ground and the other end three stories high, would look rather ridiculous, and still, this is often done! It shows poor taste, however.

If there is to be any part of this house covered with stucco, be sure to find out what kind of finish your customer prefers. Show him samples of rough, smooth, marble chip, etc., and be sure to ask him about the color — white, cream, gray, etc.

If the house is to be of stone or brick, find out how the window openings are to be arranged, whether arched tops or flat lintels. Also find out what kind of window sills are desired, stone, brick, cement, etc. These little points are

An example of making the most of the site. The problem of the house and garage on a small lot has been carefully handled here. The roof of garage forms a terrace for the first floor rooms.

Digitized by Google

usually taken care of in the plan, but it is always best to find out what your customer wants. If the house is to be of stone find out just what kind will please him most—field, quarried, cobble stone, etc.; how the joints are to be, etc.

If the selection decided upon is a frame house find out if narrow or wide clap boarding is preferred and how the corners will be finished, whether with a corner board or have the corners mitered. Should shingles be selected for the outside covering be sure to ascertain the particular way in which they should be arranged and whether corner boards are desired or if the shingles are to be weaved at the corners.

leads to the material for the roof covering. Ask if they prefer wood shingles, composition shingles, slate, asbestos, tin, tile or one of the composition roofing materials. Be sure to ask them regarding outside chimneys, if outside chimneys are desired and if so of what material.

Porches

In regard to porches, find out where they are to be located and what size is desired, if they are to be enclosed, what kind of floor is desired, whether wood, cement, tile, etc. Should columns be used, find out the exact kind and shape. Also the porch railing, whether open rails on solid bulkhead; another little point to consider is the height of this porch

windows are to be casement and what ones are to be double hung. Find out how the sash is to be divided, one pane of glass in each or just the lower one with a single pane and the upper divided, etc. Also, inquire if any of the sash is to be of stained glass or frosted glass, etc.

In regard to the casement windows, be sure to ask if they are to swing in or out. Also if they are to be hung on the sides or top. Be sure to ask if any blinds are desired, whether inside or out, and find out about storm sashes and storm shutters.

Windows are usually to be screened but ascertain if this is to go into your contract and what kind of

Select a design for your house that will look well with its neighbors' for the benefit of all.

The Foundation

Coming to the foundation find out if the preference is for solid concrete, concrete blocks, hollow tile, stone, brick, etc. Of course, should there be stone on the property, the cheapest thing to do is to use that. Inquire what height the cellar is to be and what height of foundation wall is to be above grade.

The Roof

With regard to the roof find out what style is preferred, whether hipped roof or gable end, and whether the pitch should be high or low or perhaps just a flat roof with a parapet wall around it is desired. Another point not to be overlooked is the amount of roof projection, some prefer only a short projection and some want it quite wide.

Then take up the subject of dormers, finding out if any are desired and if so, just where. This naturally

rail; some like it low and some want it high. Also find out if a separate sun parlor besides a porch is desired, its size and location. Find out if any part of the porch or terrace is to be covered with a pergola.

Sleeping porches are in favor. Find out what size and where it is to be located. Also the floor covering, whether this is to be covered with canvas or just a plain wooden floor, etc.

Windows

In regard to the windows, take particular pains to get full details regarding the wishes of your customer on this important part of the house. Find out just what heights and widths are wanted; also if there is to be any particular space to be allowed between them; how high they are to be from the floor; how the windows are to be arranged, whether single, double, or triple, etc.; what

frames are desired. While asking the questions about screening windows, be sure to also inquire if the porch is to be screened or a portion of the pergola, etc.

Bay windows are preferred by some. Find out if they are desired, whether they are to have square or slanting sides, and if a window seat is to be used in connection with them.

Doors

In regard to doorways, be particular to ask all the details of what is desired. Find out the width, heights and style of doors they like; how the doors are to swing; whether any are to be glazed. Be sure to inquire particularly if side lights are to be used with the front door. Also if any sliding doors are to be used inside.

One very important point to inquire about is the size of the front door. Some people want a 2'6" door

Digitized by Google

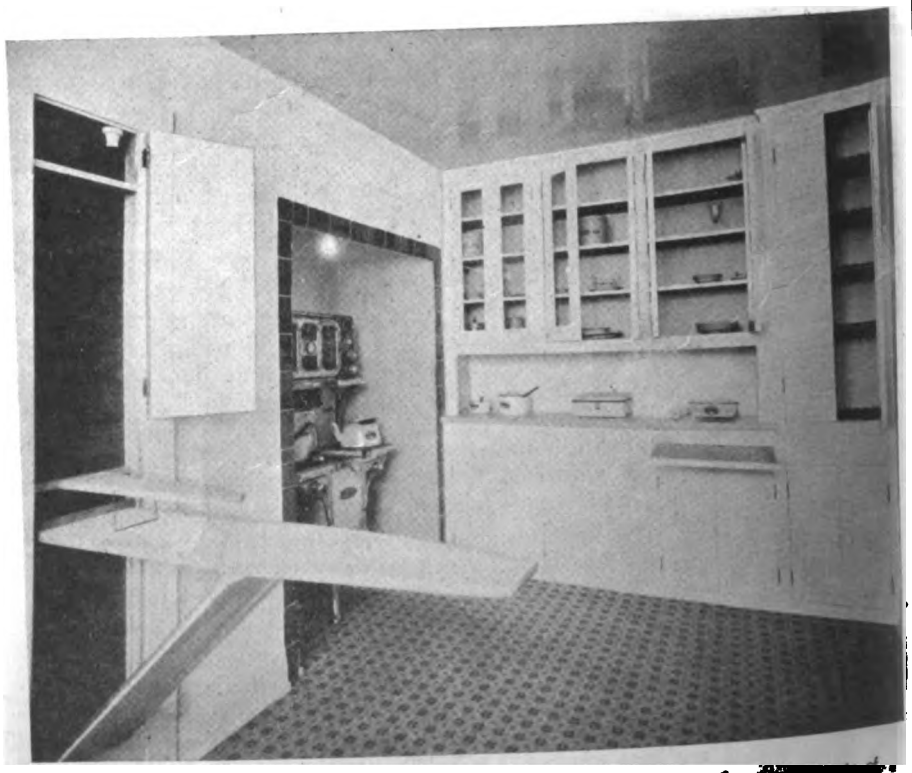
Carefully state what built-in features, etc., are desired in living room, such as fireplace, bookcases, mouldings, trim, bench, doors, etc.

and some are not satisfied unless it is four feet wide. Be absolutely sure on this point. The cellar door is frequently too narrow to allow barrels, etc., to be put in easily, so it is wise to decide on the size. While on the subject of doors, inquire about the vestibule and how it is to be fitted up, either with tile or wood floor, wainscot, etc. It is a good plan to show the prospective home owners pictures of the doors to be used so that they can select exactly the ones they like the best. Very often, doors are omitted and cased openings used. Be sure to inquire if these are desired. Also inquire if any double swing door checks are to be used and whether any doors are to have transoms above. Some people dislike the use of thresholds; others want them. Find out what your customer's desires are on this point.

The Staircase

Obtain information about the stairway, that is, find out what kind of a stairway suits the house best. It would be a good plan to show different pictures of stairways, so that the intending home owners are able to pick the style they like. Often times it will be found that the stairway desired is impossible in the size of house planned. Therefore, it is the business of the designer to get it as nearly like the desired one as possible so that it will fit in the space allotted for this purpose. Take particular pains to ask about the design of newels, balusters and hand rails and whether an open or closed string is desired.

Interior Trim



The subject of trim should be carefully considered. It is rather a poor plan to finish it in birch, cypress, pine, etc., throughout. Select the wood according to the finish desired in the different rooms. If the owner intends to have the living room fitted out with mahogany furniture it is rather bad taste to have quartered oak trim in the same room, and vice versa. Find out particularly the style of trim desired—whether mitered, cabinet, etc., or whether any corner blocks are to be used. If possible, show pictures of the trim and samples of the different woods. These are little points, but they are important in pleasing your customer.

Flooring

Coming now to the flooring, find out just what is desired, keeping in mind the item of expense. If a room is to be covered with carpet it does not need hardwood floor. N. C. or yellow pine, white and red oak, and maple seem to be the favorite woods for floors. Many others, of course, are used for special cases. Parquet floors are used to quite an extent, so it is wise to ascertain just what your customer wishes. Composition or tile floors are frequently used in bathrooms and kitchens.

Built-in Furniture

Ask about built-in furniture—whether there are to be any china closets, a buffet, writing desk, kitchen cupboards, medicine cabinet, etc. Also get particular information re-

The kitchen should have the cupboards, etc., designed to embody the [illegible] the housewife. The light over range is a handy innovation.

Digitized by Google

garding shelving. While on the subject of closets, find out if a rod for clothes hangers, or hooks are desired or whether the new style garment hangers are preferred. In this way, you can design the closets so that they will be sure to please your customer.

Do not forget to question the owners about linen closets, clothes chutes, dumbwaiters, etc., and if chair rails, picture moulding, etc., are to be used in any of the rooms and placed at what height.

Fireplaces

Inquire about the open fireplaces and get an idea of the size. Find out whether brick, stone, tile, cement, etc., is to be used, also what is preferred for the hearth. At the same time, ask whether the kitchen hearth is to be of tile or cement and how it is to be finished.

Walls and Ceilings

The question of the walls and ceilings is a very important one, some preferring plastered walls, either on lath or on plaster board while wall board of different makes is steadily finding favor. In some rooms sheet metal or wood is preferred. Sometimes the ceiling is of ornamental plaster. Find out if any mouldings, coves, etc., are desired, and if so, how wide and deep. Be particular to ask whether the cellar walls, ceiling and partitions, are to be plastered.

Be sure to mention that built-in buffet is desired; also the paneling, the doors, beam ceiling, etc., in the dining room

With regard to the bathroom and kitchen walls, inquire if these are to be wainscoted with wood, tile or hard plaster finish, or whether any portions are to have metal tile.

The Cellar

Regarding the cellar, ascertain whether a cement floor under the entire house is desired and how the cellar is to be partitioned off—into a laundry, coal bin, storage room, cold cellar, etc. Provision should be made for receiving coal. Therefore, ask if a coal chute or special coal window or other arrangement is to be used.

Even the bathroom may have some built-in cupboards, etc., in the home that pleases. State just what conveniences you desire.

Plumbing

Regarding plumbing, be sure to get some definite information as to whether there is a sewer in the street, and if not, whether a cesspool or septic tank is preferred. If there is a likelihood of a sewer running through the property in the near future, have the cesspool located in the front, otherwise to the rear of the lot.

Find out what is desired in the way of a water heater, that is, whether it is to be connected with a kitchen range, laundry stove, independent heater in cellar, coil in furnace, either singly or in combination, etc.

In regard to the piping, find out where outlets are desired; whether there is to be any faucet in the cellar or hose connection on the exterior, etc.

The plumbing fixtures should please your customer and the only way to do this is to have them make their own selection, either from a catalog or from actual articles. In placing the different fixtures, be sure to get them set at the proper height

Good Example of House Fitting Location

Built at
Bronxville
New York
Wm. A. Bates
Architect

for the convenience of the people that are to use them. If the housewife is short, the sink should not be placed too high and likewise, it should not be low for taller people.

Lighting

Regarding the lighting, inquire whether gas or electricity or both is desired. If the house is to be built in a locality where these do not exist, it is wise to make provision for them, as a house is cheaper piped or wired when being built, rather than afterwards. Ask whether center chandeliers are desired, or ceiling lights, side lights, etc. Clear up the matter of floor or wall outlets for attaching different fixtures for various appliances. While on the subject of wiring do not forget the electric bells.

Range

With regard to the use of a range —coal, gas, oil, electric—this depends on the locality and the desires of your customers, so you must ask what kind is to be used in order to make proper provision for connections.

Heating

The subject of heating the house is of vast importance. You will find most people have a preference for one type of heat or the other, so you can simply ask whether stoves, furnace—steam heat or hot water is preferred and where radiators are desired or *not* desired.

Hardware

Hardware is another item on which you can please or displease a customer. You must remember that the hardware of a house is most often touched, and if a person does not like a certain thing he or she is always reminded of the fact whenever the object is handled. Although only a small point, be absolutely sure to get the design and style that your customer wants.

Gutters and Leaders

Provision should be made for removing the rain water from the roof. This, of course, is done by means of gutters and leaders. Ascertain what type the customer prefers, standing, hanging, box, etc., and what kind of material; also, if round or square rain water leaders are desired and whether they are to be of copper or galvanized iron. While on this subject, inquire if the flashings are to be of composition roofing, tin, galvanized iron, or copper.

Painting

We now come to the subject of painting. This is the finish of the house and much depends on pleasing your customer on this point. Find out what combination of colors will be desired, both on the exterior and interior. Ask particularly just how the outside trim is to be finished. If the sash is to be of one color, the frame another and the trim another, etc., all these points must be considered in advance. The same is true with the interior of the house. Go through every room with your customers, inquire just how the walls, the trim, the doors, the ceilings, the floors, etc., are to be finished.

Outside Work

Coming now to the work to be done outside of the house, inquire whether cement or other walks are to be used about the premises. If the garden is to be landscaped, consider those features which need building up. Then inquire what style fence, corner post, entrance gate, arbor, pergola, etc., is to be about the premises, and whether there are to be any out-buildings such as a garage, poultry house, barn, etc.

If this line of questioning is followed out, it will clear up the different points on which the home builder has only a hazy conception. It will enable the architect and builder to design and erect the home that the owner wants.

Cost of a House

Data Reduced to Percentages for Easy Method of Estimating the Probable Cost of a Complete Dwelling

MERELY the cost of the materials and labor that enters into the construction of a house, is not the only expense to be considered. There are other items that add materially to the cost of a house, and these should be taken into account by the home owner, as well as by the architect and contractor.

To give an idea of just what these costs are, we present some very interesting figures, which were prepared by Daniel Crawford, Jr., builder, of Philadelphia. These prices are based on 1921 operations. They give an itemized list of expenses for a house operation, totalling approximately $7,000.

The dwelling under consideration was a two-story house of six rooms and bath, built of brick. This list was based on the construction of one hundred houses from practically the one plan; therefore, it is a fair average. An owner can go over these figures carefully and put down his own values, so as to arrive at a good idea of what his new home will cost. We have carefully figured the items out in percentages so that the same proportions can be applied to buildings of more or less cost.

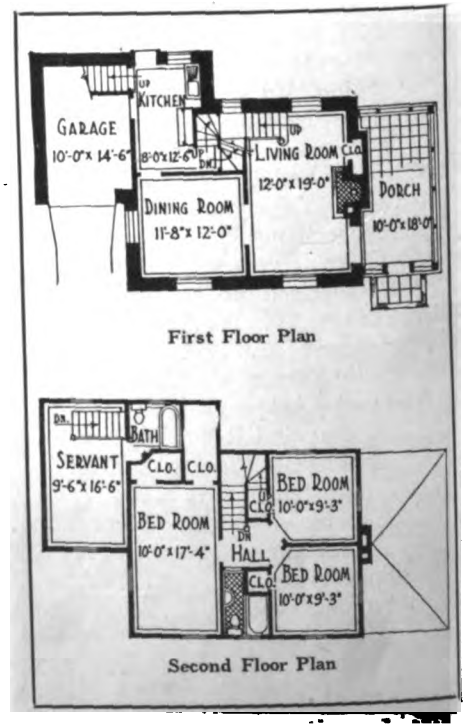
Homes With Attached Garages

Two Colonial Designs Have This Convenient Feature

MANY people desire a garage attached to the house so that it is possible for them to enter their car in stormy weather without going outside.

The two designs shown on this page illustrate different methods of this sort of construction.



The upper picture is a sketch of a home following New England Colonial lines in its design. The garage here is at the rear and is entered from the house through a covered passage-way. It is in no sense a part of the house proper, although attached to it.

This house was designed by Watson K. Phillips, architect, of Philadelphia. The construction is frame and the outside may either be covered with wide clapboards or shingles.

The house and garage shown below were recently built at Narbeth, Pa., from plans prepared by Wallace and Warner, architects, of Philadelphia.

The house is a charming adaption of the Dutch Colonial style of architecture which, of course, found its origin in Pennsylvania.

How Own Your Home Expositions Help the Building Industry

By CARL B. EIMER, A. B.

Member National Association of Real Estate Boards

VISITORS attending the "Own Your Home" Expositions, held in Chicago, Cleveland, Detroit, San Francisco, Trenton, Boston, New York, etc., should be impressed through the usual publicity channels that these Expositions are no place for the curious or those who wish to be entertained. Those who are closely connected with the Expositions realize more each year how necessary it is to limit the attendance to people really anxious to learn the elements of home building and benefit by the authoritative information available on each and every phase of construction and equipping.

To those who are not informed as to the origin of the "Own Your Home" Movement it is interesting to know that it was fostered by the U. S. Department of Labor and first called the "Own Your Home" Department of the Labor Department.

The program contemplated was most elaborate but the founders of the movement were without sufficient funds to carry on the necessary educational campaign which must be concurrent with such a new undertaking.

During the war the program was practically abandoned though the construction of small homes was decreasing in an appalling way. The tendency of the American people to become rent payers has increased as the population has increased for the past five years. The war, limiting construction, and the attendant high cost of materials and labor, was no stimulant to the weak urge of the new "Own Your Home" Movement to the nation to build.

It was then about five years ago that Robert H. Sexton, who was probably the best informed man in the country on the housing problem, succeeded in organizing a little group of men who came to believe that the only way to bring relief to the congested centers where new housing was so badly needed was in bringing together all the interests dependent upon housing construction in a concerted appeal to the public.

Alfred Wagg was then regional director for the government in New York City, of the "Own Your Home" Movement and was with the writer connected with the Amsterdam Development and Sales Company. Mr. Wagg and myself were fortunate to be among this first group interested with Mr. Sexton in visualizing the movement as first planned by the government.

WE were determined to bring together the architects, the landscape gardeners, the banks and building and loan associations, the contractors, the manufacturers of building materials, plumbing installations, ventilating systems, heating apparatus, gas and electrical appliances, paint and varnishes, wall papers and furnishings and a hundred other industries that would benefit by the resumption of the building of homes.

We knew that if these interests could get right at the general public, show them how attractive each part of the home could be made and submit the lowest possible figures to them, that we could immediately explode the theory that paying rent was a cheaper way to live.

Labor and materials and many other necessary products were extremely high at that time but so were rents way out of proportion. Statistics of banks, Government bureaus and other authorities show that up to 1913 the average man paid 20 per cent. of his income for rent, but now in 1921 and up to the present time, the same figures show that he pays 40 per cent. of his income for rent—and it is paid at the expense of almost every other trade, business or profession—diverted to the pockets of the landlords. Not only have business men suffered generally, but the halt in building which has enabled landlords to maintain the high rents has deprived families dependent upon the building industry for their incomes of a means of living. Eleven million people are dependent either directly or indirectly upon the building industry.

Now when the average man is paying the 40 per cent. figure for rent, and materials and labor are much lower than even at this time last year, every indication points to a most successful Exposition in New York, which will be held in the 69th Regiment Armory, April 22nd to 30th, 1922.

Manufacturers and dealers are realizing more and more that placing their wares on a counter or table in a row will not stimulate a visiting public to rush out and purchase a lot and evolve the dream house they have always wanted.

Different committees pass on all concerns accepted in each division, disseminate all publicity on the work of special divisions, and insist that exhibits are of educational character.

THE dream house must be achieved at the Exposition before them; therefore, the exhibits will be in the form of side walls of lumber, brick and stucco; bathrooms entirely fitted; kitchens equipped with the latest and most approved appliances and labor saving devices; music rooms that will appeal to everyone of good taste and a love of beauty; all making a strong selling appeal for building materials, bathroom fixtures, kitchen floor covering, ranges, pianos, draperies, rugs, wall papers and every other item that will be shown in the applied form.

Let everyone get behind this movement and watch the sales reports after the Exposition. Of more importance, however, than the commercial value of such a medium as the Exposition is the fact that a thousand more home owners are a thousand more stabilizers of our local and national government, heralds of prosperity, whose buying power is unlimited.

A New Servant in the Home

By LILLIAN CASSELS

Of the Society for Electrical Development

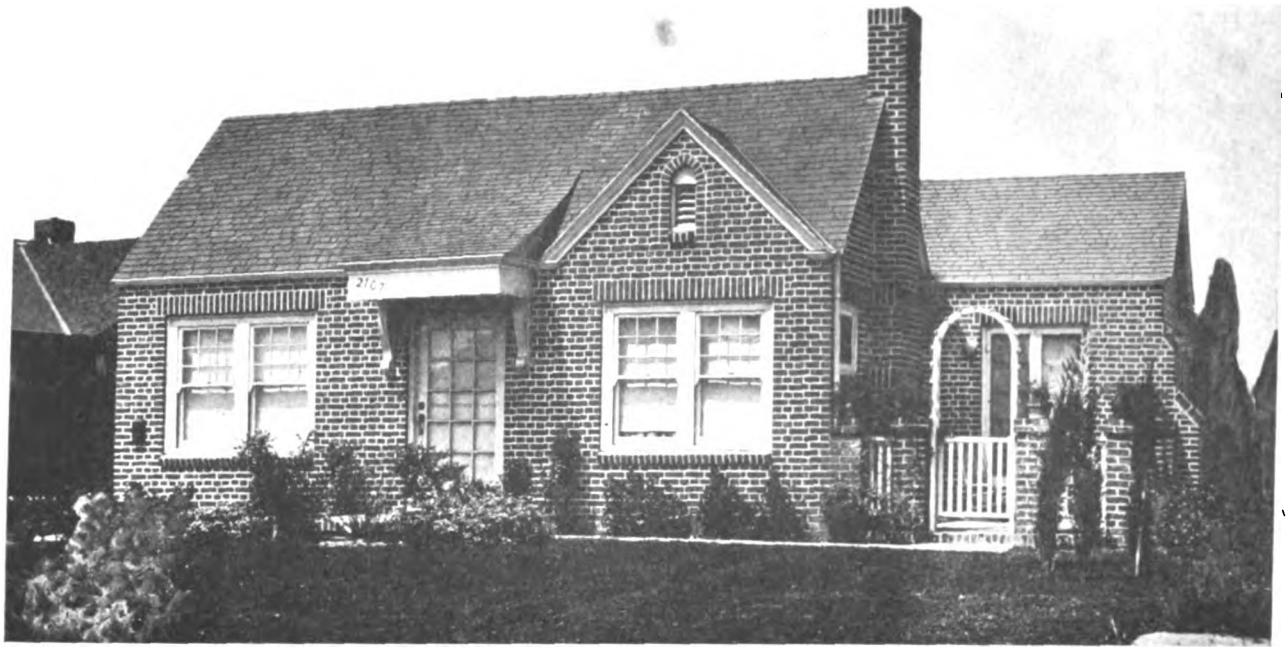
IT IS well to remind those who build our homes that the word "economy" must not be understood as a mere pinching of the dollar. It has been dignified, in circles where thought is given to the relation of the home to the great structures of society and government, into the term Home Economics. And this is being worked as rapidly as is possible into a system of labor-saving which must very soon replace that labor-wasting which has surrounded housework in the past.

It has been demonstrated in numberless ways that woman is destined to play a definite part in the scheme of progress. For long the servant as well as the mother of the race, she has been in nearly every home a drudge, a wrestler of pots and pans, a servant without recompense, with never an afternoon off or a moment for leisure. And in all but a small proportion of those homes, this condition still prevails.

Electricity in the Bedroom Finds Many Uses. View in Electric Apartment of Queensboro Corporation, Jackson Heights, New York.

And still, as shown in a recent bulletin issued by the Smithsonian Institute, modern use of electricity, steam, and machinery has so simplified labor in general that this power, if divided per capita, would give to every man, woman and child in the United States labor that would require thirty individuals to perform by hand.

"This," says the amazing Smithsonian statistician, "gives every person in the nation the equivalent of thirty slaves!"



Women are beginning to claim an equitable division of this stock of slaves. In many homes, devices which perform the hard labor of housework by electric power instead of by personal power are being installed as fast as the women in those homes learn of the real value of machinery in housekeeping. In the home whose plans and electric itinerary is pictured here, there has been ample provision made for the most important electrical servants; for if electrical devices are to be used by women to the best advantage it is essential that the electric circuit, which is coming to be recognized as woman's "Circuit of Service," shall contain plenteous outlets so that her flock of servants can get out. Locked up within the wires they are but potential slaves; given abundant convenience outlets they will stand ready, willing, ever alert, ever powerful, to perform all the hard labor of housekeeping, making women truly the mistresses of goodly retinues.

In every room, it will be noted that the electrical plans have included one or more convenience outlets that may be used for attaching the electric cleaner. This powerful little engine of sanitation is so well known in its functions that it needs no introduction; yet there are many homes where if it is used at all the housekeeper must climb on a chair, detach a lamp, and hang her cord to a chandelier or bracket. This robs the sweeper of much of its efficiency.

In the kitchen there is provision for a dishwasher, which has in homes where it is known transfigured that task which is perhaps the most sodden and drab of all the assortment of disagreeable jobs; which has taken out of dishwater forever the hands which need now but to clear dishes and put them away, thus freeing those hands for more pleasing and more womanly tasks. There may also be attached a kitchen motor, which in many forms is being offered to do all the beating, whipping, kneading, mixing and grinding jobs that help to make cooking tedious when done by hand.

As the housekeeper becomes familiar with electricity, she will find every year some new servant which she will soon learn is essential in her newly formulated plan of home economics, and, as in every instance electric servants prove to be of real economic value in the long run, it is well to install during the home-building, provisions for the future development of this inevitable force which is moving toward the establishment of real home economy; a home economy which proposes to surround the intimate phases of life with administrative efficiency, while freeing the spirit that animates those homes for more joyous occupations than that of household drudge.

Attractive Brick Bungalow

Unique Design Containing Five Conveniently Arranged Rooms

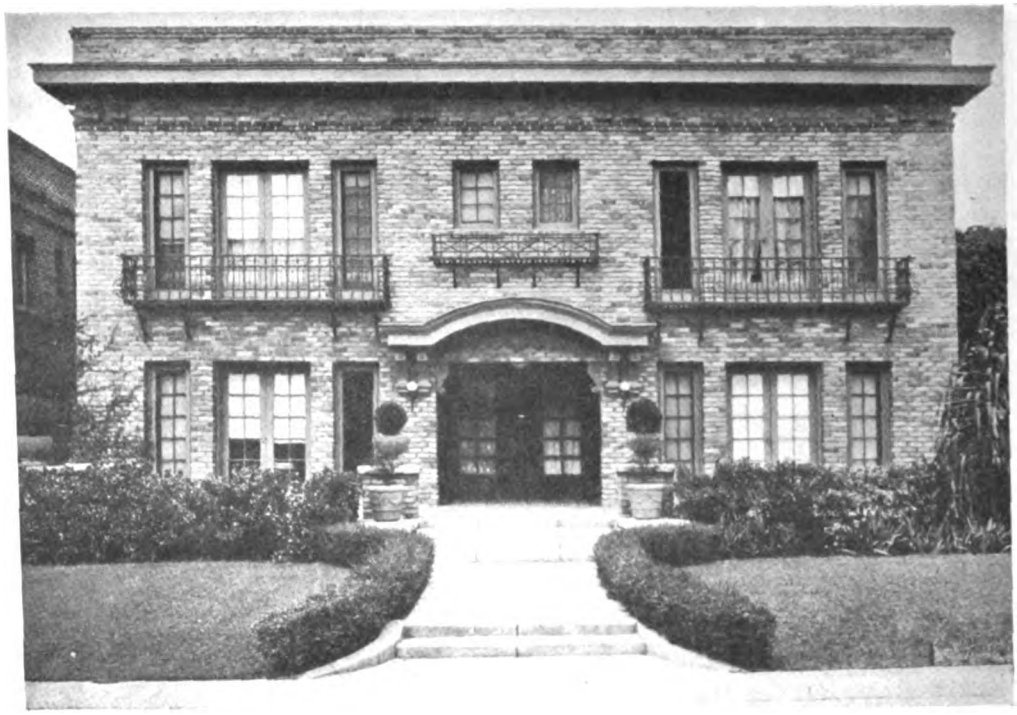
HERE is quite an attractive design of a bungalow home built of brick. Its outstanding feature is the terrace on the right hand side, reached through an archway of wood. This terrace serves the purpose of a porch and, of course, must be built on the shady side of the house. From this terrace one can reach both dining room and living room through French doors.

There are two large bedrooms in this bungalow, between which is the bathroom. The adjoining hall in a T shape connects with every room in the house. Note the many convenient closets; coat and linen closet in the hall, large bedroom closets, built-in dressers in bathroom.

From the entry porch one enters the living room, which is of ample size and which contains a large open fireplace with a bookcase four feet high at one end.

"This is the true nature of home: It is the place of peace, the shelter not only from all injuries, but from all terror, doubt, and division. In so far as it is not, this is not home."

—John Ruskin.



Over this is a double casement window which, with the mullioned window and the glass door in this foremost part of the house, gives sufficient light to the front part of the living room, and the French doors leading out on the terrace light up the rear part of this room.

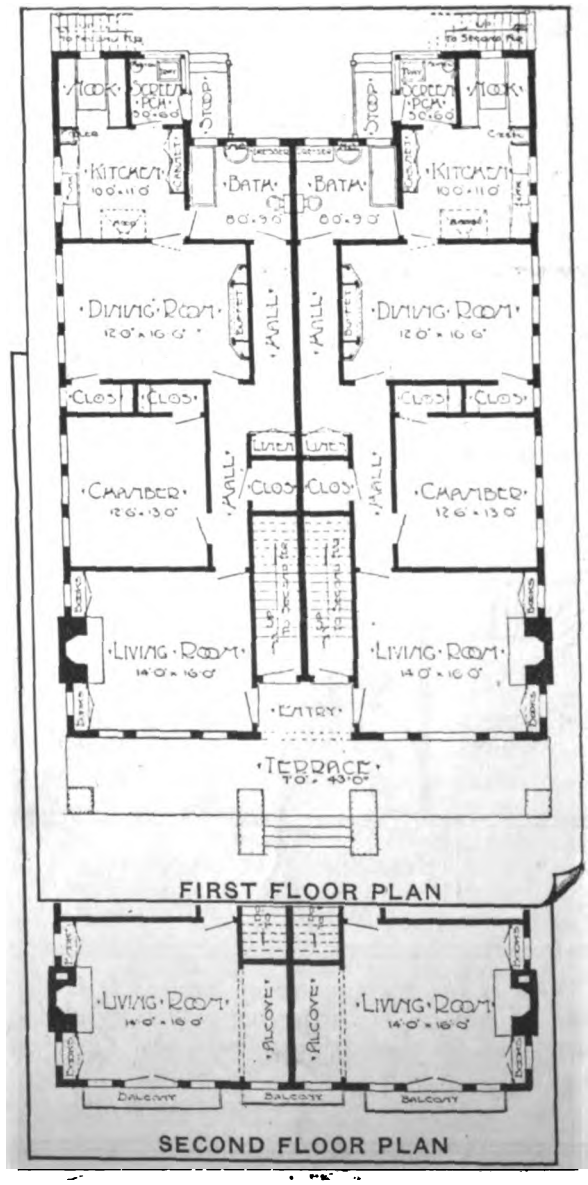
The dining room has a built-in buffet and is exceptionally light, since the French doors open on to the terrace with a window at the rear and one at the side.

The kitchen is rather an odd shape, but it is very convenient. There is no cellar under this house, as it was intended to be built in the South. Since the arrangement does not include a cellar, plenty of closet room has been provided for storage purposes. Where necessary, this bungalow can be conveniently heated by means of a small hot water system, such as is now on the market at small cost.

Digitized by Google

FOUR FAMILY BRICK HOUSE

HERE is an attractive design for a convenient four-family house. The plan has been so arranged that each family has the advantage of having a separate entrance, all are entered from a common vestibule.



As the plan shows, the rooms are exceptionally large in size and are comfortably arranged. A feature of the living rooms is a large open fireplace with bookcases on each side. The dining room has a large, built-in buffet on one side.

Each kitchen has an attractive breakfast nook. The sink is placed directly underneath the window with a drainboard on each side. A screened porch in the rear serves as a service entry.

On the second floor, the space above the entry was utilized as an alcove to the living room. This has been arched over and made a pretty feature of the room.

The cellar contains the heating plant, as well as the hot water heating system which supplies all apartments with the needed hot water.

As shown, this apartment house is built of brick, but a similar house can be built of hollow tile, stucco, solid concrete or concrete blocks, stone or even frame.

The arrangement of the French windows on the front is a distinctive feature of the design. All rooms are supplied with closets.

This apartment house was recently built by the De Luxe Building Co. of Los Angeles, Cal.

An apartment house such as this forms a very desirable investment. The rental from three apartments would be sufficient to pay the upkeep of the house and the owner can reside in one apartment practically rent free.

This house can be successfully built on a 50-foot lot, but of course, if more space is available, so much the better. Plenty of air space would add to the desirability of the apartments.

A good deal of the appearance of a house of this sort depends on its setting. If it is too close to the street, it loses its beauty. As shown above, it is set back about 25 feet from the street line, allowing a rather dignified approach to be used. With planting as shown, the house is set off in proper shape.

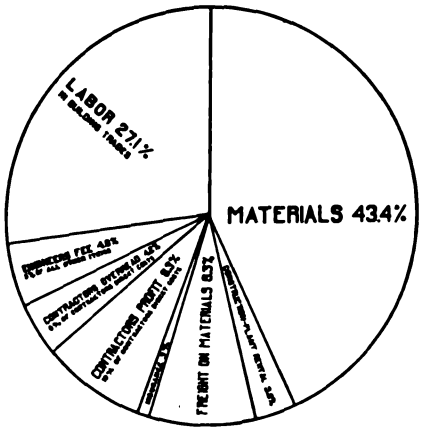
Cost of Industrial Buildings



Interesting Chart Showing Distribution of Owner's Direct Building Costs

By MONKS & JOHNSON, Engineers, New York

THE chart presented opposite shows the proportion of the cost of a typical industrial building which is attributed to each item of an interesting classification.

Five of these items—namely: Engineer's fee, Contractor's overhead, Contractor's profit, Insurance and Plant rental—fluctuate but slowly, and that only as the cost of commodities in general rises or falls, or as they are directly affected by the remaining three items of the chart.

Labor. Wages of artisans employed in the building trades gradually rose from December, 1913, to a peak in May, 1920, and from that peak they have descended not more than fifteen per cent. But the efficiency of labor, which had fallen as wages rose, has returned to that which obtained in 1914. This is due primarily to the scarcity of work. As a result of this increased efficiency the cost af labor on buildings has probably fallen fifty per cent. from the peak of the war period.

Material. The price of materials depends upon the cost of production and demand. The demand for building materials has been so small during the last twelve months that it is probably true that in order to stimulate the market, materials have sold at a price leaving the manufacturer and dealer no profit, and in some instances have probably been sold below what it cost to produce them. The price quoted in the open market for building materials would not indicate that these sacrifices had been made, but contractors have recently been able to buy at prices far below market quotations. The cost of production is therefore not an important factor at this moment and in any event is likely to change but slowly. From this analysis of the market it would seem that no substantial drop in prices will occur within the next year, but that the seasonal demand likely to occur in the Spring will undoubtedly cause a stiffening of prices.

Freight. There is some talk of a reduction in freight rates, but a cut of twenty per cent. in this item would result in a decrease of less than two per cent. in the cost of building.

Conclusion. From the foregoing short discussion it would appear that the cost of building now is as low or lower than it will be at any time in the next year.

Factory Buildings Can Be of Attractive Design as the Above Picture Shows—This Is the New Building of Browstein Company, Clothing Manufacturers, of Los Angeles, California

Setting Out Grade Stakes on the Building Site

A Simple Method That Can Be Followed by the Contractor

By JOHN P. COYLE

HAVING often met, during the course of my work, many builders and superintendents who were keen to have explained and shown to them how the transit and level was used and the method followed in giving the various elevations required on a building job and reading in the July issue of BUILDING AGE the interesting article by Mr. R. P. Smith on simple surveying has prompted me to write this article in the belief that it will also prove interesting and useful to the many readers of BUILDING AGE.

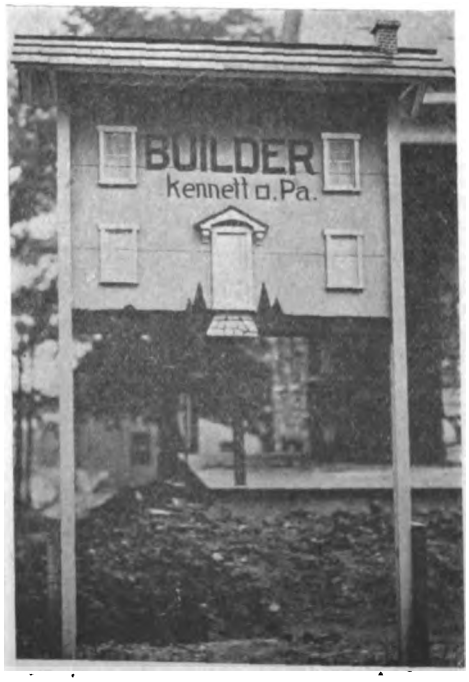
The setting out of a few grade stakes or giving the elevations required during construction is not, as a rule, a difficult operation, and should be understood by every builder and superintendent. It is hoped this article will make clear the simple procedure followed. Either the transit or level may be used, generally the transit on building jobs, as with it lines may also be run and angles laid off.

The rod used should be preferably one of the target type used in leveling, but a piece of stick may be taken and marked off, or at a pinch a six foot rule or a tape may be used.

The elevations are always found referred to some point, whose elevation, either actual or assumed, is known. This may be a city bench mark (B. M.), a point on an adjoining building, or a point on the curb near the proposed building.

To illustrate how a line of levels is carried along, let us assume that a B. M. some distance away from job is used, and that its elevation is given as 110.50. Let the rod be held on this point, then with instrument set up a convenient distance away, take reading on rod where it is intercepted by horizontal cross hair in telescope. Say this reading is 4.50. This is known as a + or a foresight and is recorded as shown in column 2 (Fig. 1), and this reading added to elevation of B. M. gives the height of the instrument or H. I., shown in column 3. The rod is now moved forward ahead of instrument and another reading taken, say 3.10. This is called a — or backsight and is put down as shown in column 4. The reduced elevation in column 5 is obtained by subtracting the backsight from the height of the instrument and is the elevation of the point where rod is held.

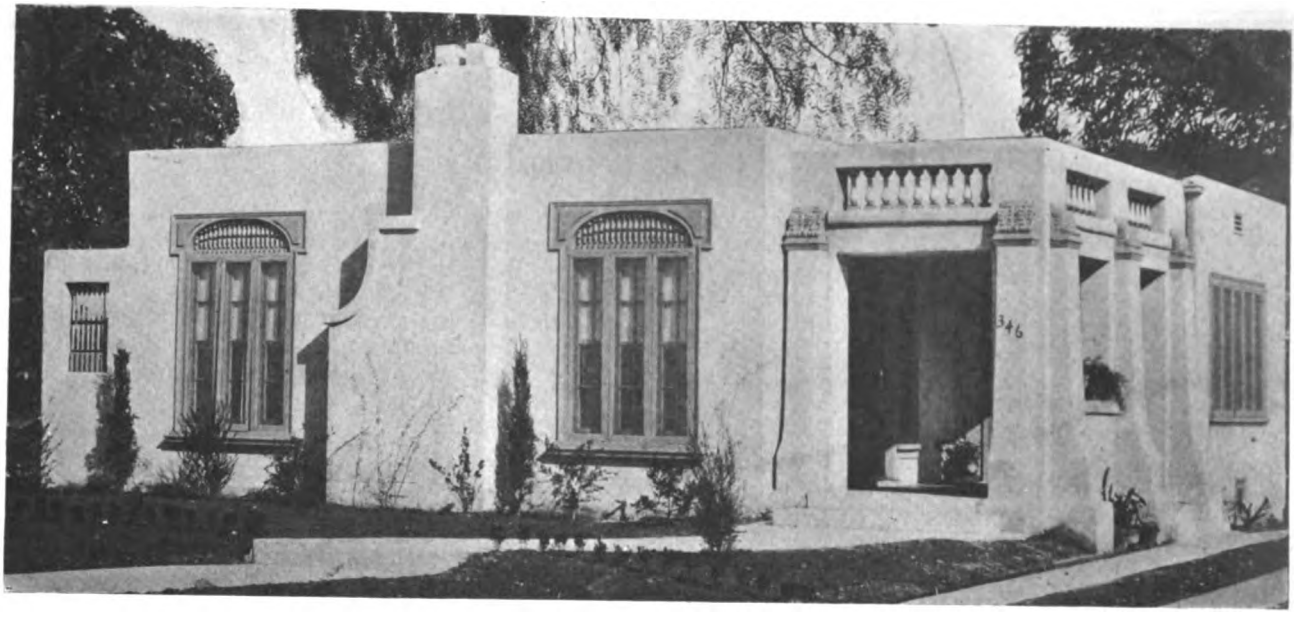
Elevation Bench Mark	Foresight +	Height of Instrument H I	Backsight —	Reduced Elevation
110.50	4.50	115.00	3.10	111.90



Showing how field notes are recorded

Still holding the rod in same position, the instrument is now moved ahead, set up and the rod read again, and this new reading added to the last reduced elevation, gives the new height of the instrument. This process is repeated until site is reached, when last reading can be taken on some convenient and permanent point and its elevation established for future use during construction. It will be seen that with the instrument height known, any number of — sights or "shots" can be taken, and any given elevation set out. For example, suppose that a cellar excavation is in progress and that it is down to somewhere near subgrade. The H. I. is, say 102.60, and subgrade elevation is given as 94.20. Let rod be held on any desired point in the excavation and a reading taken which is, say 7.40, and subtracting this from H. I. gives a reduced elevation of 95.20, showing that the excavation at that particular point is still 1'-0" above subgrade.

As another example showing how the rod may be used inverted. Let it be required to set out an elevation of 106.40, and that the H. I. is the same as before, viz., 102.60.



Now 106.40 — 102.60 = 3.80, or the required elevation is 3.80 higher than H. I. Invert the rod and raise it up until 3.80 is read on it, then upper end of rod will be at elevation 106.40. See that the rod is always held plumb. It is a good idea also to check back to the B. M. or starting point, particularly when a line of levels have been run, as an error can then be detected, either in the notes or as sometimes happens, in a reading, in which case it may be necessary to run the levels over again.

Advertising the Building Contractor

THE progressive builder will advertise his business in different ways and having a sign on every building that he is erecting is one of the best and most effective ways to bring his name before intending home builders—they are the ones that will look over each job to see how it is being put together. One enterprising Pennsylvania builder has a novel sign board that talks building and we are glad to publish a picture of this for the benefit of our readers. Here is a good suggestion that is worthy of imitation. Mr. Worrall is not only a good builder, but a clever advertiser—he even makes the name of his town, "Kennet Square, Pa.," stand out differently, folks will remember him. The construction of the sign board is simple and the effect is unique. Any builder can make his own sign board at small cost.

Bungalow *of* Spanish Design

By CHARLES ALMA BYERS

HEREWITH is illustrated an exceptionally artistically handled interpretation of the Spanish-style little house now so popular in southern California. It is distinctive mainly in that its exterior shows considerable ornamentation. This ornamentation is found introduced principally about the small corner porch on the front—in the capital treatment of the pilaster effects and in the railing inserts of the roof walls—but also to some extent in the decoratively-finished tops of the front window groups, as well as in the grilled window of the wall extension from the left front corner.

The outside walls of the house are of tan-colored cement-stucco over frame construction, and the trimming about the windows, as well as the pilaster capitals, is done in greenish-brown. The roof, like that of the Indian pueblo, is concealed, being flat and of composition. A massive stucco-surfaced chimney gives relief to the main front wall, and the windows on the front, as well as the group on the right side, are of the casement type. The corner porch is floored with cement, and from it there is a main doorway leading directly into the living room, and also a pair of French doors giving immediate access to the dining room.

The house contains, as reference to the accompanying floor plan reveals, living room, dining room, two bed rooms, bath room and kitchen, besides the customary rear entry porch and a most charming breakfast nook off the kitchen. A center hall provides convenient connections, and, suggesting the bungalow in this respect, there are many delightful built-in features and large closets. The dining room, for instance, contains an excellent cupboard and sideboard combination, the bath room has a medicine case and a cabinet of dresser drawers and shelves, the hall possesses a linen cabinet, the kitchen is equipped with the usual cupboards and sink and a draught cooler-closet, and the breakfast alcove is provided with the usual stationary seats and table, while a pair of laundry trays is a screened porch feature.

The interior finish consists of old ivory with mahogany trim in the living room and dining room, old ivory alone in the bed rooms and hall, and white enamel in the bath room and kitchen. Hardwood flooring is used throughout except in the bath room and kitchen, which have tile floors.

This little house is located in Los Angeles, California, and the plans are by the De Luxe Building Company, of that city. It possesses neither basement nor cellar, but is equipped with built-in gas radiators for heating and all modern conveniences.

Heating the Low-Cost House

Describing the Layout and Cost of the Hot Water System of Heating

By CHARLES L. HUBBARD

A SYSTEM of hot-water heating is similar in construction and operation to one designed by steam, except hot water is the medium of heat transmission from the boiler to the rooms. The circulation through the system is due to the difference in weight of the water in the supply and return risers leading from the boiler to the radiators above, which in turn varies with the difference in temperature and the height or elevation of the radiator above the boiler. This motive power is very small, which makes it necessary to exercise considerable care in laying out the supply and return piping in order to give an even distribution of heat to the different radiators. For example, with an elevation of 30 ft. above the boiler, and a difference of 10 deg. in temperature between the supply and return, the force available for overcoming the friction in the pipes and producing a circulation through the radiator is equivalent to that produced by a difference in height of about 1¼ inches in the two columns of water.

CHANGES IN BUILDING CONSTRUCTION.—The conditions in this respect for direct hot-water heating are practically the same as for steam, and need not be especially considered in laying out the building plans. If indirect stacks are to be employed, the framing for the registers and any cold-air supply inlets should be taken into account.

BOILERS.—Boilers for hot-water heating are similar to those for steam, the round cast-iron type being commonly used for the smaller sizes, and the sectional (see Fig. 1) for the larger ones. There is no dividing line between the two, as to size, and they overlap more or less in their practical application.

RADIATION.—The efficiency of a direct hot-water radiator depends principally upon the temperature at which the water is circulated. The best practical results in gravity heating are obtained with the water leaving the boiler at a maximum temperature of about 180 deg. in zero weather and returning at about 160 deg., which gives an average temperature of 170 deg. in the radiators.

Under these conditions, with a room temperature of 70 deg., we will obtain about 170 thermal units per sq. ft. of radiating surface per hr. as against 250 for low-pressure steam. In other words, a hot-water radiator

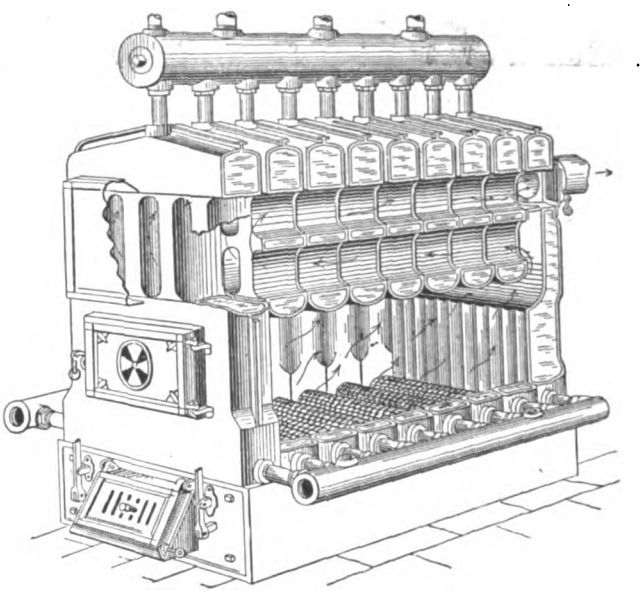

Fig. 1—Sectional Hot Water Boiler

to warm a given room must have $\frac{250}{170} = 1.5$ as much surface as a steam radiator supplied with steam at 1 lb. pressure. Of course, if the temperature of the water is increased, the efficiency of the radiator is also increased and the surface can be reduced in like proportion, but as stated above, the temperatures given have been found to be about the most satisfactory, everything considered, and this ratio between water and steam surface is generally accepted in practice for this class of work.

The method of computing radiating surface for hot-water heating is to divide the total heat loss from the room, in thermal units per hr. by 170, the result being the square feet required.

Computing the radiation for the different rooms, by the same method as for steam, but using an efficiency of 170, we have the following amounts required for the different rooms.

(Hot-water radiation required for the different rooms.)

Room.	Square feet of direct hot-water radiation.
Living room	102
Hall	17
Dining room	52
Kitchen	42
Second Floor—	
East bedroom	80
Southwest bedroom	42
Northwest bedroom	44
Bath	16
Hall	21

In this case we will use 3-column radiators, except in the front hall, 32 in. high, the number of sections being marked on the plans. In most cases this gives slightly more surface than called for in the above table, as an integral number of sections will not correspond exactly with the computed surfaces.

A slight increase is purposely made in the bathroom radiator, and about 80 per cent. in the entrance hall to offset excessive leakage at times of opening the outside door.

Radiation for the upper hall has been placed on the first floor beside the stairway the same as in the other systems of heating previously shown.

Direct radiation has been kept from the main entrance vestibule and also from the living room by the use of "rotation" heater.

These are indirect stacks made up of pin radiator sections and hung beneath the floor. They are encased in galvanized iron and the path of the air through them is similar to a hot air system.

In computing the size of a regular "indirect" radiator, taking its entire air supply from out of doors, it is customary to compute the surface for direct radiation and multiply this by 1.5 for "pin" radiators of good depth.

PIPING—A common method of making the pipe connections for a

Digitized by Google

system of hot water heating is shown to have direct mains and returns for each individual radiator. In this case an air valve must be placed in the top of each radiator near the return end. It is advisable to use pet cocks operated by hand in this case instead of automatic valves, because if anything happens to clog it, when in an open position and prevent it closing promptly, much damage may be done to floors and ceilings by the rapid leakage of water under these conditions. Another important matter in connection with hot water heating not called for with steam, is provision for expansion.

When water is heated it expands, and a vented tank must be placed well above the highest radiator and connected with the system of an "expansion pipe" to catch the overflow and to deliver it back to the system when the water cools and contracts.

The expansion pipe may make connection directly with the boiler, or if desired, it may be taken from the top of one of the risers to the upper floor. In any case it must be on a line which can never be shut off from the boiler. If by any chance it were shut off and forgotten, a dangerous explosion might occur when the temperature of the water was next raised. Another piping arrangement, which in self-venting, is sometimes used. In this case there are no pockets and the air can flow from all high points directly to the expansion tank, which is vented to the atmosphere. A single-pipe arrangement is shown at the left which reduces the number of drops or risers passing through the lower rooms. This is often a matter of some importance if they are not concealed. In this case both supply and return connections are made with the same end of the radiator, as indicated in the drawing. Under these conditions the water supply to the lower radiator is cooled somewhat by the return from the upper one, but with properly proportioned pipes this is so slight a matter that it may be neglected in buildings now over two stories in height. A two-pipe connection is shown at the right with the supply inlet at the top of the radiator. No air valves are required with this system of piping which is a strong point in its favor. Care should always be taken to locate the expansion tank where there can be no possible danger of freezing or of the pipes connecting with it.

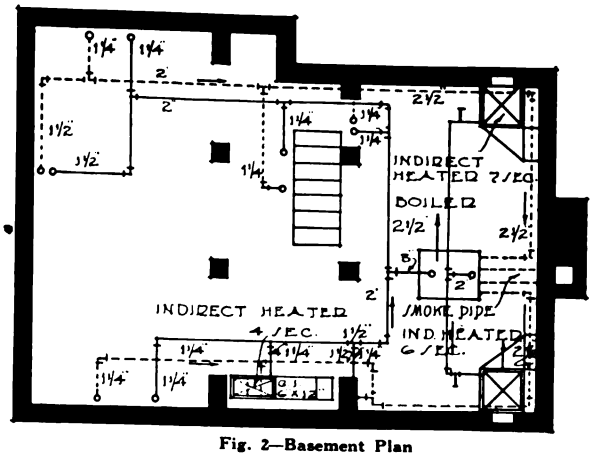

Fig. 2—Basement Plan

The upper part of a closet, opening from a warm room, or a bathroom, are usual locations for the expansion tank. If it must be placed in the attic it should be located close beside the boiler chimney flue and closed in with a wooden boxing lined with hair felt. This should enclose it on all sides except that against the chimney which should of course be left open to admit the heat.

Comparison of Costs.—The approximate cost of installing the system, as shown in Figs. 2, 3 and 4 is $1,155. Thus we have $475 for furnace heating with a return-air arrangement; $800 for a plain system of low-pressure steam, and an approximate increase of 25 per cent. or $1,000 for an average system of vapor heating; and $1,155 for hot water, with indirect stacks for the living room and entrance vestibule.

Where indirect stacks are used, as in the living room; their elevation above the boiler is apt to be slight and in consequence the circulation is likely to be sluggish if they are placed on a supply pipe leading to the upper floor radiators. To avoid this trouble, have a separate supply line properly vented by pet cock or a small vent pipe direct to expansion tank.

SIZES OF DIRECT HOT-WATER HEATING MAINS AND BRANCHES.

Diameter of pipe, ins.	Sq. ft of radiation.	Diameter of pipe, ins.	Sq. ft. of radiation.

Electrical Equipment of the Modern Cottage

Suggested by REGINALD TRAUTSCHOLD, Electrical Engineer of the Society for Electrical Development

PROPER location of the various electrical outlets is deserving of considerable study and the layout given here will give valuable suggestions along this line. The list of appliances will give an idea of the devices which would be desirable in a house like the Modern Cottage shown on another page. It is not intended to recommend all the appliances, nor is it expected all would be used in one house, but the list does indicate what might be used.

LOCATION OF OUTLETS, ETC.

Cellar

Ceiling light outlet at foot of cellar stairs controlled by switch at head of stairs.
Ceiling light outlet near heater.
Wall light outlet at service panel.
Ceiling light outlet near coal bin.
Special service outlet for cellar work shop tools.
Ceiling light outlet in cellar work shop.
Bell transformers or batteries for bell circuits.

Porch

Ceiling light outlet for entrance porch controlled by switch in hall.

Hall

Central ceiling light outlet controlled by 3-way switches in hall and at head of stairs on second floor.
Ceiling light outlet in closet controlled by wall switch in door frame.
Outlet for light on newel post.
Convenience wall outlet for vacuum cleaner and floor lamp.

Living Room

2 ceiling light outlets controlled by 3-way switches at hall and dining room entrances.
Wall light outlets on either side of fireplace.
2 wall light outlets.
2 convenience wall outlets.
1 special service floor outlet.
Floor bell connection to kitchen annunciator.

Dining Room

Central ceiling light outlet controlled by 3-way switches at kitchen and living room entrances.
4 wall light outlets.
Special service floor outlet for table appliances.
Special service wall outlet for serving table.
Floor bell connection to kitchen annunciator.
2 convenience wall outlets.

Kitchen

Central ceiling light outlet controlled by 3 way switches at living and dining room entrances.
Wall light outlet over sink.
Wall light outlet over range.
Special service outlets for irons and for electric range and water heater if cooking rate pertains.
2 Convenience wall outlets.
4 Call annunciators.

Living Porch

2 Ceiling light outlets controlled by wall switches.
2 Convenience outlets for service or lights.
1 Special service outlet for tea table appliances.

Second Floor Hall

Ceiling light outlet controlled by 3-way switches at stair landing and near bathroom door.
Ceiling light outlet for linen chest controlled by wall switch in door frame.
Convenience outlet.

Bed Rooms

Central ceiling outlet controlled by switch at door.
2 wall light outlets.
2 convenience wall outlets.
Bell connection to kitchen annunciator.

Bath Room

Ceiling light outlet controlled by switch.
Convenience outlet.
Bell connection to kitchen annunciator.

SOME SUITABLE APPLIANCES

General House Use

Lighting — Vacuum Cleaner
Fan Motors (0.2 to 1 ampere)
Bell-ringing Transformer

Kitchen

Range (requires special circuit)
Tea Kettle (4 to 5 amperes)
Disc Stove (2 to 6 amperes)
Frying Pan (5 to 6 amperes)
Radiant Grill (5 to 6 amperes)
Toaster (4 to 6 amperes)
Meat Chopper — Coffee Grinder
Egg Beater — Bread Mixer
Knife Grinder — Silver Polisher

Cellar Work Shop

Grinder
Glue Pot (2 to 5 amperes)
Soldering Iron (1 to 2 amperes)
Bench Drill

Laundry

Washing Machine (2 to 3 amperes)
Irons (4 to 6 amperes)
Laundry Machine — Wringer

Garage

Fire Pumps — Portable Drill
Grinding Machine — Buffing Machine
Charging Batteries

Dining Room

Chafing Dish (4 to 6 amperes)
Percolator (3 to 5 amperes)
Cigar Lighter (0.25 ampere)
Water Heater (1.5 to 10 amperes)
Radiator (2.5 to 5 amperes)
Samovar (4 to 5 ampeers)

Bedroom or Boudoir

Curling Iron — Massage Vibrator
Bed Pad (0.5 to 1 ampere)
Reading Lamp
Hair Dryer (0.5 to 0.75 amperes)

Miscellaneous

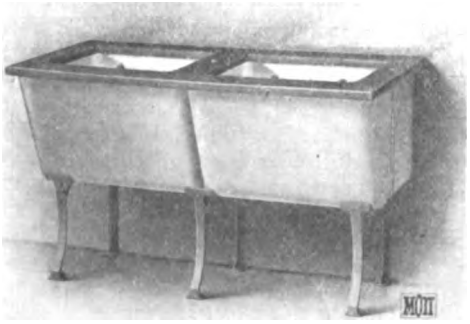
Sewing Machine
Milk Warmer (3 to 5 amperes)
Shaving Mug (1.5 to 5 amperes)

Note: — Ampere capacities within brackets are guides for special service outlets. If more than 2 or 3 amperes are required, special circuits should be employed.

Digitized by Google

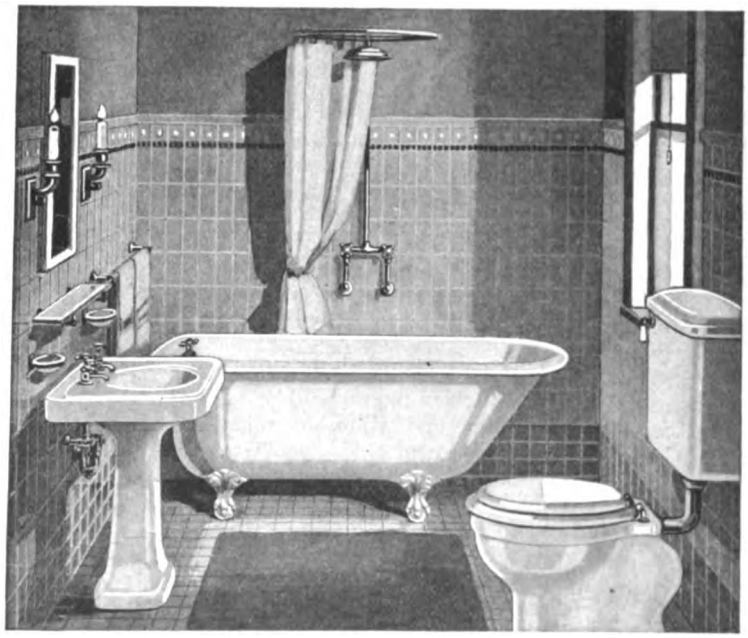
Plumbing Equipment for the Modern Cottage

Shown on Page 24



SELECTING the proper fixtures for the plumbing equipment of the home is an important point. A good deal of one's comfort depends on having reliable plumbing fixtures. They should be as good as one can afford to have.

For the kitchen we would advise a sanitary sink of enamelled iron with drain board and back all in one piece. For a good-looking finish it is also advisable to have this with an apron as shown in our illustration. The sink pictured here has a combination swing nozzle faucet which enables one to have the water at the desired temperature.



In placing the kitchen sink, particular care should be taken to have it at the proper height so that it will be comfortable for the lady of the house. The sink shown here has no legs, but is supported by concealed hangers placed behind the high back of the sink. It will be noticed that the drain board is on the left side. This is the most convenient for dish washing as it saves one motion.

The laundry tubs are located in the cellar. These can now be had in white porcelain at a moderate price. They are set upon legs to the desired height and are easily kept clean.

They are certainly a far advance over the old wooden stationary tubs that were first used or the more recent cement composition ones.

It is in the bathroom that fixtures and fittings, of course, show to the best advantage. In the center illustration, we show a very desirable outfit for the bathroom suitable for the Modern Cottage. There is an enameled iron bathtub, five feet long with a shower attachment. A pedestal lavatory is shown and above this a glass shelf and mirror with electric lights on both sides. The water closet is of porcelain with a low down porcelain tank. The seat of the water closet can be obtained in either oak, mahogany or white enamel finishes, as may be desired. As shown in the illustration, this bathroom has a tile floor and wainscoting.

These illustrations are shown here through the courtesy of the J. L. Mott Iron Works.

Of course, if one prefers, other designs of fixtures may be substituted, but those shown will prove satisfactory.

Do not try to save money on the piping. Cast iron pipe is usually employed for the drain pipes and these are generally concealed in the walls. The joints should be carefully packed with oakum, then filled with molten lead and caulked so as to make an absolutely tight joint to prevent sewer gas escaping.

For water service, galvanized iron pipe is now almost universally used; for ordinary purposes ½- pipe is sufficient.

It is very desirable to have separate cut-offs for each line of water piping, so that any one fixture can be cut off on either the hot or cold water supply, whenever it may be necessary. All faucets will require renewing of the washers and if separate cut-offs are used, one fixture can be closed off instead of shutting down the entire house. Gate valves, though they cost a little more, are to be preferred as they are easily operated.

Leaks sometimes occur and then it will be found very desirable to be able to shut off the damaged section without closing off the entire water supply. This is a feature that will be found very convenient by the lady of the house, because, the fates have it, that this sort of an accident usually occurs when she is alone. There should be a shut-off valve in the cellar where the water supply enters, as well as an outside cut-off at the lot line.

Exterior hose connections should have a shut off valve inside cellar so that exposed portions can be drained.

Decorating the Modern Cottage

Suggestions for Simple Artistic Effects that May be Carried Out at Small Cost

By MISS C. W. WILSON

THE color combination for exterior of the Modern Cottage shown elsewhere in this issue may be varied to suit taste. As a suggestion as to what can be done to secure an artistic looking home the stucco may be of light cream color, the trim such as sash, doors, seat and entry, flower box, etc., in white; the shutters, leaders and gutters in a tapestry green; the chimney of course in stucco with the top of red brick. The color of the roof can be either green or red as preferred; either would look well for this design of house.

The Hall

On entering this house one would come into the hall and see a neat stairway in mahogany and white with the trim finished in white enamel. The walls may either be tinted or papered, as desired, we would suggest that this be carried out in Colonial gray. The same painting or paper should be used for the hallway on the second floor.

A green tapestry cushion furnished for the seat gives a touch of color. At the window the curtains may be of iridescent Sundour silk, which shades from a soft green to a pale dove gray. One or two small Oriental rugs in the hall and a plain gray carpet with small black figures on the stairs make a good combination.

The Living Room

The walls in the living room should be gray, a little darker than that used for the hall. The woodwork in this room may be finished in mahogany, and the ceiling tinted white. The fireplace is of red brick; select a design that is Colonial in appearance. The rug for this room should be two toned gray and the hangings in a soft mulberry tone.

In furnishing this living room, we would suggest that a large six foot davenport, upholstered in striped mulberry mohair, be placed before the fireplace and backed by a six foot mahogany table. On either side of the fireplace, we would suggest placing a fireside wing chair, upholstered in the same material as the davenport and another chair in a soft-toned tapestry. Then one may use one or two small floor lamps with silk or parchment shades, one or two end tables and a few other individual pieces of mahogany.

The Dining Room

Considering the fact that from the dining room a pleasant outlook on an artistic garden may be had, we suggest that the walls be paneled to a height of seven feet with walnut strips and a neat moulding on top. The spaces between the strips should be divided in symmetrical panels which are covered with a two-toned gray and soft blue grasscloth, with a little gold fleck in it. The space above the panelling and the ceiling should be in white. For the floor, an Oriental rug would look charming, but one could use a figured domestic rug in the same tones as the curtains and walls. The hangings may be in French blue Sundour silk.

For furniture we would suggest a dining room suite in walnut.

The Kitchen

The kitchen floor should be covered with a blue and white block linoleum cemented down. All woodwork in this room should be finished in white enamel. The kitchen wall may be blocked off into a tile effect wainscot and this finished heavily in white enamel. The wall space above the wainscot may be in Alice blue and the ceiling in a lighter shade of blue. The kitchen range of blue and white enamel, does not cost any more than the ugly black ones. The double window over the sink may be made a feature of the room with blue and white checked gingham curtains.

The Living Porch

The living porch can be very attractively furnished with a few black wicker chairs, table and artistic bird cage. The couch-hammock and chairs may be upholstered in cretonne—gray and mulberry, to harmonize with the living room.

The Laundry

The laundry has been situated in the basement and partitioned off with plastered walls and ceiling tinted in cream. It would be well to equip it with all modern conveniences.

The Bathroom

For the bathroom we would suggest the use of Meteor gray tile for the floor and wainscot. This will give a very good background for the white enamel fixtures. Above the wainscot the wall should be tinted a light Colonial gray in a flat finish oil paint, and the ceiling white in flat oil colors.

Bedroom No. 1

The furniture in this room, which may be used as the main bedroom, is suggested to be of mahogany. The walls would look well in a gray figured wall paper. Soft blue-gray silk overdrapes would be pretty at the windows. The floor may be covered with small Chinese rugs of blue and yellow, or the same color carried out in a chenille Wilton. The wood trim in this room finished in white enamel with the doors in mahogany.

Bedroom No. 2

The walls may be tinted or papered in pale green with the trim in old ivory and the doors tinted in a pale green the same as the walls. The mouldings of the door and cornice may be striped in Terre Verte as this will give a pleasing contrast. The furniture in this room may be a bedroom set of rich ivory, with the lines and beads green and blue and painted with a design of field flowers in baskets. For the floor we would suggest several small rugs, carrying out the same color scheme as the walls and furniture with a faint suggestion of pink flowers to correspond with the painted designs on the furniture. The hangings in this room may be of ivory colored scrim with an edging of pale green.

Bedroom No. 3

This bedroom may be fitted up as the son's room. The walls would look well finished in a light tan figured paper. The trim would be best finished in fumed oak and the furniture also of fumed oak, consisting of a chiffonier with mirror, a day bed, a good sized desk, and a comfortable easy chair. For the floor a small Oriental rug would give a desired touch of color; for hangings cream colored rep with a soft brown edging would look well.

Landscaping the Home Grounds

How to Obtain Pleasing Garden Views from the House at Small Cost

By GRACE V. PEKER

WHEN the house is finished, its appearance can be greatly enhanced by a simple landscaping of the grounds. Two important points should be considered; the appearance of the house and grounds from the street, and the view from the inside of house to the grounds.

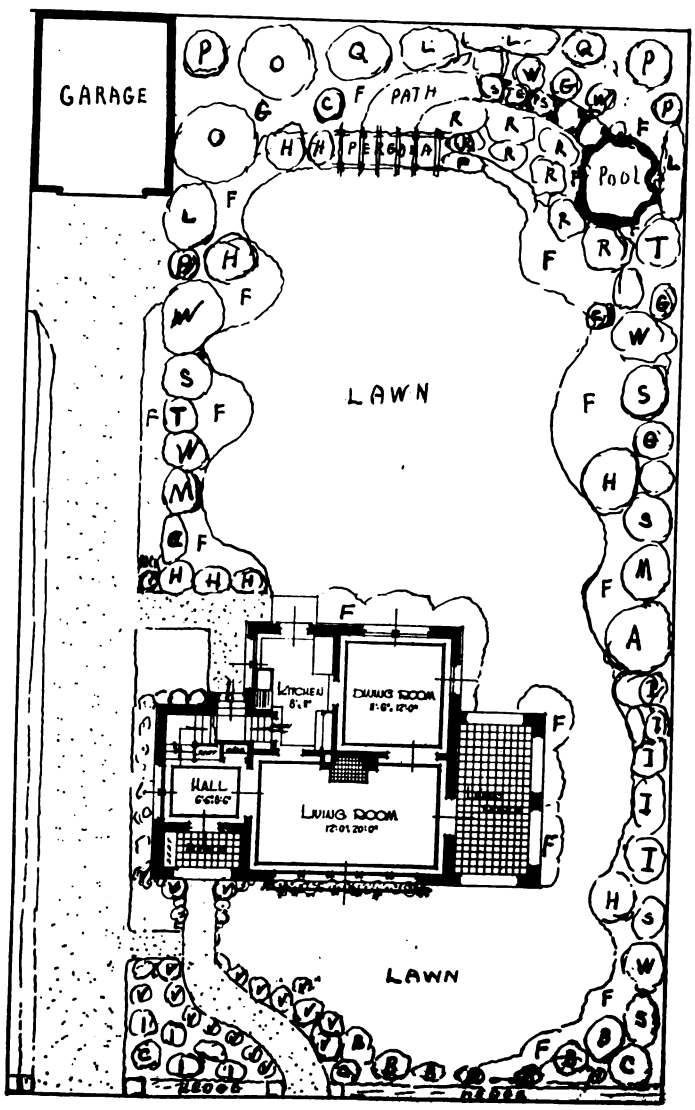
For occupants of the house, it is more important to have a good view from the windows than to have your garden give a correct appearance from the street. A garden is observed from the house, therefore care should be taken so that pleasing vistas will be had from any window and the porch. It is comparatively easy to obtain this effect, and at a very moderate cost.

The diagram below shows a 60x100 ft. plot on which the modern cottage shown on another page, has been built. Particular care has been taken so as to obtain a pleasing view from the dining room, since it will be observed that the best view is from this point. A key with the diagram gives the names of the different plants, trees, and shrubs that can be used in order to give a succession of bloom. These will cost but little.

In designing the planting, avoid straight lines as much as possible. Note that in this layout the different plants seem to converge together, ending at a two-seated pergola near the rear, with some tall trees in back.

This is a little scheme in perspective that will add an appearance of depth to the lot. In other words, the same principles that are used in making scenes for a stage have been carried out here. All points should vanish in the distance, and your plants can be arranged so as to secure this effect.

Tall trees should be at the rear and in corners. Then some high shrubs, next lower ones, and in the foreground either annuals or perennial flowers. In this way one secures an appearance of height, but the plants should not be placed in regular order. Here and there a break can be made by inserting a high plant or tree, which rises from the lower ones. A few rocks correctly placed so as to avoid an artificial look, will add a pleasing touch to the garden.



A path of stone with a few stone steps leads to a sunken pool of concrete hid among shrubs, the backs of this pool are covered with ferns, ivy, iris, funkia, etc.; just a pretty little nook that will come as a surprise to the visitor. The garage is practically hidden from view.

Key to Planting

A = Arbor Vitae Eligatissma (Golden tipped)
B = Barberry
C = Red Cedar (10 to 12 feet tall)
E = Alathea (Rose of Sharon)
F = Flowers in variety (annuals and perennials)
G = Forsythia (golden bell)
H = Hydrangea
I = Rosa Rogusa
L = Lilac
M = Magnolia
O = Oak (12-14 feet high)
P = Lombardy Poplar (18-20 feet high)
Q = Maple (12-14 feet high)
R = Rhododendrons
S = Spirea Van Houttei (Bridal Wreath)
T = Philadelphus (Mock Orange)
V = Evergreens in variety; dwarf arbor vitae, spruce, pines, yew, ilex, hemlock, retinospora, etc.
W = Weigelia Eva Rathke

Vines for Pergola

Wisteria
Honeysuckle
Clematis
Boston Ivy

Suggestion for Landscaping a 60 x 100-Foot Plot

Perennials for Sections F

Columbine, Anemone, Coneflower, Hollyhocks, Iris, Phlox, tall; Phlox, dwarf; Larkspur, Sweet William, Fox Glove, Golden Glow, Coreopsis, Blanket Flower, Shasta Daisy, Forget-Me-Not, Day Lily, Funkia, Lily-of the Valley, Bleeding Heart, Poppy, etc.

Annuals for Sections F

Geraniums, Petunias, Zinnias, Asters, Alyssum, Cosmos, Heliotrope, Candytuft, Portulaca, Marigolds, Verbena, Begonias, Coxcombs, Ice Plant, Pansies, Salvia, Balsam, Ageratum, Nasturtiums, etc.

Quantity Survey of Modern Cottage

(Continued from page 25)

CARPENTRY

Timber—All No. 1 common stock, hemlock, rough unless noted.

Cellar girders—	
6" x 10" spruce—1/16, 1/8	120 F.B.M.
2" x 3" nailer—46 lin. ft.	23 F.B.M.
Wall plates—	
3" x 8"—2/18, 2/14, 4/12, 3/10	284 F.B.M.
Posts—	
4" x 6"—6/10	180 F.B.M.
Studs, girts and plates, 1st floor—	
2" x 4"—24/16	246 F.B.M.
Studs, etc., 2nd floor—	
2" x 4"—100/16	1,067 F.B.M.
1st floor joists—	
2" x 10"—18/14, 27/12	960 F.B.M.
2nd floor joists—	
2" x 10"—54/14	1,260 F.B.M.
2nd floor ceiling joists—	
2" x 6"—48/14	672 F.B.M.
Rafters	
2" x 6"—9/16, 42/14	734 F.B.M.
Hips and ridge	
2" x 8"—4/18, 1/10	110 F.B.M.
Framing for hood, etc.	
2" x 4"—45/12	360 F.B.M.
Floor bridging	
2" x 3"—250 lin. ft.	125 F.B.M.
Cellar partitions	
2" x 4"—12/14	112 F.B.M.
Sheathing (⅞" x 8" shiplap)	
Walls—to cover	724 sq. ft.
Flat roofs—to cover	88 sq. ft.
Sheathing paper (waterproof)	800 sq. ft.
Shingle lath—(⅞" x 3")	1,400 lin. ft.
Grounds (¾" x 2", surfaced 1 side)	1,800 lin. ft.
Sheathing for cellar partitions	
(⅞" x 8" shiplap)—to cover	170 sq. ft.
Rough flooring (⅞" x 8" shiplap)	
First and second floors—to cover	1,232 sq. ft.
Furring (⅞" x 2")	200 lin. ft.
Shingle roofs (18" stained shingles)	
136 squares	9,400 shingles
Shingle sides (24" stained shingles)	
49 squares	1,600 shingles

Exterior Finish

Hood and first floor cornice:	
⅝" x 3¼" M. & B. ceiling—to cover	236 sq. ft.
⅞" x 3" fascia	150 lin. ft.
4" crown moulding	150 lin. ft.
⅝" x ⅞" cove	130 lin. ft.
Main cornice:	
⅞" x 8" soffit	70 lin. ft.
⅞" x 3" fascia	70 lin. ft.
4" crown moulding	70 lin. ft.
⅝" x ⅞" cove	70 lin. ft.
Raking cornice:	
2" cove	54 lin. ft.
Dormer cornice:	
⅞" x 3" soffit	64 lin. ft.
⅞" x 4" fascia	64 lin. ft.
2" mould	64 lin. ft.
⅞" x 2" cap	64 lin. ft.
4" bed mould	64 lin. ft.
Flower boxes:	
(1⅛" wood boxes lined with zinc)	
12" x 12" x 5' 0" long	1 unit
12" x 12" x 4' 6" long	2 units
Porch seat:	
2' 0" wide x 4' 0" long, high back, sawed ends, etc.	1 unit
Wood brackets for rear porch hood	2

Exterior Finish

Windows:	
Frames complete with sash, outside trim, etc. Sash 1½" thick, glazed D. T.	
Cellar windows:	
Single top hung sash, casem., 3' 0" x 2' 0", 4 light	3
Mull. sash, etc. 3' 0" x 2' 0", 4 light	1
First floor windows:	
Group of five D. H. sash, ea. 2' 4" x 5' 0", 12 light (masonry)	1
Single D. H. sash, 3' 0" x 5' 0", 16 light (masonry)	1
Single D. H. sash, 2' 6" x 3' 2", 12 light (frame)	2
Mull. D. H. sash ea. 2' 6" x 3' 2", 12 light (masonry)	3
Mull. D. H. sash ea. 2' 10" x 4' 6", 16 light (frame)	3
Single D. H. sash, 2' 10" x 4' 6", 16 light (frame)	1
Triplet D. H. sash, ea. 2' 4" x 3' 6", 12 light (frame)	2
Shutters (1⅛" thick, solid paneled):	
2' 4" x 5' 1" pr	1 pr
3' 0" x 5' 1" pr	1 pr
2' 6" x 3' 3" pr	3 pr
Blinds (1⅛" thick, movable louvres):	
2' 10" x 4' 7"	4 pr
2' 6" x 3' 3"	1 pr
Exterior door frames (1¾" thick rabbeted) complete with outside trim:	
Frame for front ent. door 2' 10" x 6' 10"	1
Frame for rear ent. door 2' 8" x 7' 2"	1
Frame for cellar ent. door 2' 6" x 6' 8"	1
Frame for doors to living porch, 4' 0" x 7' 0"	1
Exterior doors (all to detail):	
Front ent. door, 2' 10" x 6' 10" x 1¾" glazed	1
Rear ent. door, 2' 8" x 7' 2" x 1¾" glazed	1
Cellar ent. door, 2' 6" x 6' 8" x 1¾" glazed	1
Doors to living porch, pr. ea. 2' 0" x 7' 0" 1¾" glazed	1 pr
Finished flooring:	
Living room, dining room, ent. hall, plain sawed white oak, 13/16" x 2¼"—to cover	442 sq. ft.
Kitchen, etc., No. 1 maple, 13/16" x 2¼"—to cover	88 sq. ft.
Second story, No. 1 comb grain Y. P. ⅞" x 2¼"—to cover	480 sq. ft.
Lining paper under floors	1,100 sq. ft.
Scuttle to attic 3' 0" x 3' 0"	1 unit
Slat floor under laundry tubs, 3' 0" x 4' 0"	1 unit
Joist hangers (¼" x 2" W. 1):	
For 2" x 10" beams	8
For 4" x 10" beams	5

Interior Finish

(Whitewood unless noted)

Door trim:	
⅞" jambs, ½" stops, ⅞" x 4½" moulded and mitered trim with wall moulding. Trim both sides.	
For doors 2' 6" x 6' 8"	5 sets
For doors 2' 4" x 6' 8"	6 sets
For doors 2' 0" x 6' 8"	1 set
For cellar doors (plain) 2' 6" x 6' 6"	1 set
Trim for inside of exterior doors:	
Front ent. 2' 10" x 6' 10"	1 set
Rear ent. 2' 8" x 7' 2"	1 set
Cellar ent. 2' 6" x 6' 8"	1 set
To living porch 1 pr. 4' 0" x 7' 0"	1 set
Trimmed openings finished same as for doors:	
Opening 4' 6" x 6' 8"	2 sets

Interior Finish

Trim for windows:
7/8" x 4½" moulded and mitered trim with wall moulding, ½" stops, 1⅛" moulded stool, 7/8" moulded apron, 5/8" x 7/8" cove under stool.

For windows, group of 5, ea. 2' 4" x 5' 0"	1 set
For windows, single 3' 0" x 5' 0"	1 set
For windows, single 2' 6" x 3' 2"	2 sets
For windows, mull. ea. 2' 6" x 3' 2"	3 sets
For windows, mull. ea. 2' 10" x 4' 6"	3 sets
For windows, single 2' 10" x 4' 6"	1 set
For windows, triplet, ea. 2' 4" x 3' 6"	2 sets

Base:

7/8" x 6" moulded	420 lin. ft.
2" base mould	390 lin. ft.
½" quarter round at floor	420 lin. ft.
Picture moulding 7/8" x 2¼"	350 lin. ft.
Mantel for living room	1 unit
Seat for hall	1 unit
Hook strip (7/8" x 4")	50 lin. ft.
Rabbeted shelf cleat	25 lin. ft.
1" dia. pipe clothes rod	14 lin. ft.

Interior doors:
(2 cross panel birch veneer)

Door 2' 6" x 6' 8" x 1½"	5
Door 2' 4" x 6' 8" x 1½"	6
Door 2' 0" x 6' 8" x 1½"	1
Solid pine cellar door 2' 6" x 6' 6"	1
Whitewood door to plumbing pipes 1' 6" x 3' 0" (with trim)	1
Closet shelving (7/8" x 12" pine)	30 lin ft
Kitchen cupboard with countershelf, drawers, doors, etc.: Front 4' 0" x 8' 0"	1 unit
Main stairs first to second story: 14 risers 3' 2" wide, balustrade, etc.	1 flight
Cellar stairs, 12 risers box pattern	1 flight

General Conditions

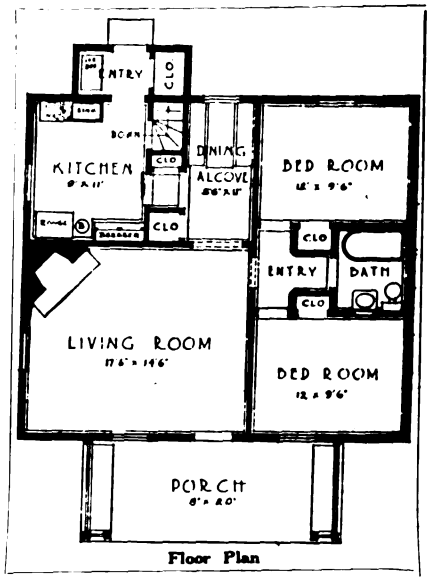
Add for permits, fees for water and sewer connections, etc., insurance and general overhead charges.

Allow for general work not listed, such as grading, planting, etc.

Include in sub-bids such items as hardware and applying same, painting and decorating, plumbing and gas fitting, heating, electric work, etc.

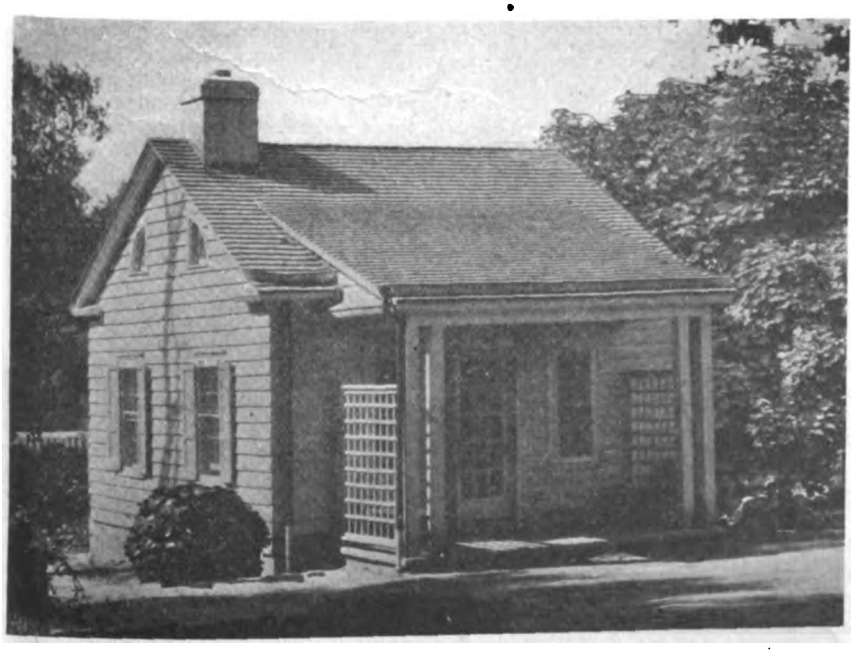
The Small House

Can Have Many Conveniences at Moderate Cost



BECAUSE one has a limited amount of money to spend there is no reason why the home should not be artistic in design and convenient in arrangement.

As a practical example of what can be done in this line, we illustrate a pleasing little house on the bungalow order. This contains the necessary conveniences for a small family of refinement. It was built after plans prepared by C. E. Schermerhorn, architect, of Philadelphia, Pa.

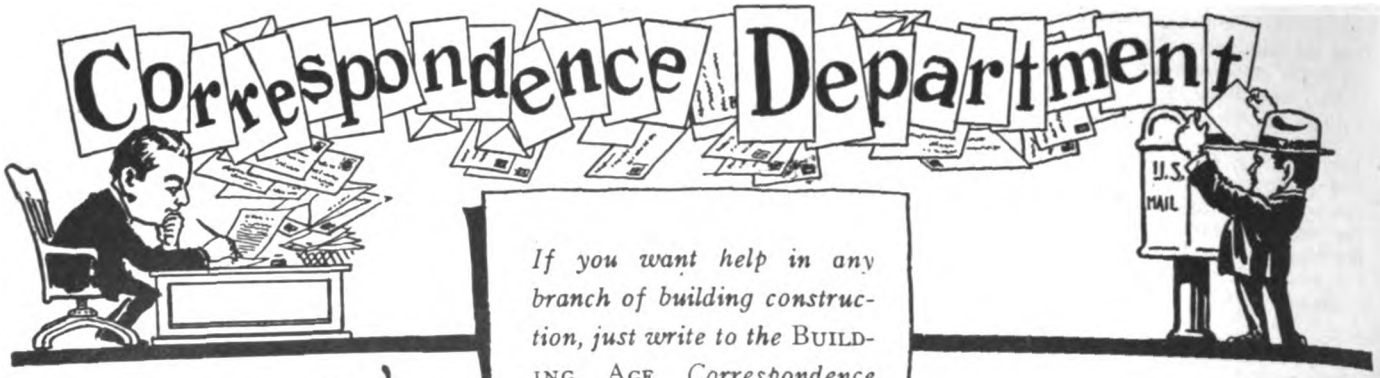


The two bedrooms have a bathroom between and in each bedroom there is ample closet room.

A corner fireplace adds a cheery note to this living room. At the rear through a cased opening, one enters the dining alcove. This can be attractively fitted up at very little expense. The window in the rear should, of course, be slightly above the height of table and if a casement window is used, it would add to the attractiveness of this dining nook.

A short passage-way conveniently connects the dining alcove with the kitchen. Two closets are on either side of this passage-way. The kitchen, though small, is well laid out; the range is situated in the corner so that a direct connection can be had to the chimney. A handy kitchen cupboard is located next to it. On the opposite side is the sink and entrance to the cellar. An entry from the rear leads to the kitchen, on one side; the ice box is conveniently located and opposite is a closet.

Floor Plan



The exterior of this house is finished in wide clapboards. The porch is of simple design and the treatment of lattice and seats adds just that touch which stamps it out of the ordinary. There has been real designing here.

A French door at the front forms a pleasing entrance. The little gable windows and shutters also add interesting features to the side elevations.

For those who desire them, BUILDING AGE and THE BUILDERS' JOURNAL can furnish complete blue print plans and specifications at a nominal sum.

All readers are invited to discuss the questions and answers published.

Quick Way to Get Pitch of Window Sills

HERE is a little kink that I know is not generally used because so few are acquainted with it. It is an idea that will be found useful so I am sending you a sketch of it to present to my fellow readers.

Hold a folded two-foot rule with the Figs. 13 inches and 11 inches upright and facing you place a T bevel against the left side, setting the blade at Figs. 13 inches and 10⅞ inches, the rule being one inch wide. This gives you a pitch of ⅛ inch in one inch which is the standard, and the mills get out a stock stool to fit that pitch and stand level. Door sills should be 1/16 inch in 1 inch pitch.—**E. W. Conlee.**

Short Cut in Finding Hopper Bevels

A RECENT issue of BUILDING AGE contains an exposition of the science of obtaining and applying bevels as practiced, it may be presumed, in the institution from which it originates.

It might interest some to know how these problems are solved by workmen in the shop and on the job and it may surprise some to read the statement that their methods of doing work is often impractical and at times impossible on the actual job which is the ultimate goal of their direction, and further, frequently erroneous in presentation to pupil and reading public.

As a text, the contribution to January issue of BUILDING AGE is potential with possibilities of criticism and since BUILDING AGE invites discussions as well as presentations, the following is respectfully submitted.

Fig. 1 shows the most simple, certain and expeditious way of finding a hip bevel on roof board or hopper sheathing. Contrast this method with the process given in your January issue. A toy hopper is the subject and as such is susceptible to a treatment not always applicable to man-size jobs. The process of solution presumes a knowledge of the run (1¾ inch) and rise (3½ inch) from which the bevel is supposed to be developed with a steel square. The figures given for run and rise will not yield the correct bevel but they do reveal, in this instance, the danger of employing intricate processes. The plan of this toy hopper shows at once its bevel and the simplest means possible for getting the mitre. Specifications show it is 3½ inch longer on its top line, therefore, 1¾ longer at each upper corner. Any ordinary workman with this data would lay the bend line directly upon the stock with no hesitation. Now, the top edge of this stock is to be worked off so as to present a level surface when in place. This being true, a common mitre square of 45 degrees applied upon this flat surface "develops" the true mitre.

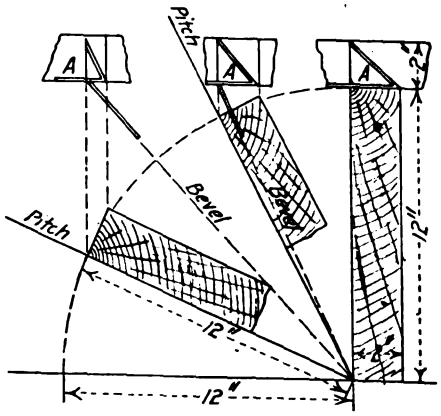

Fig. 1

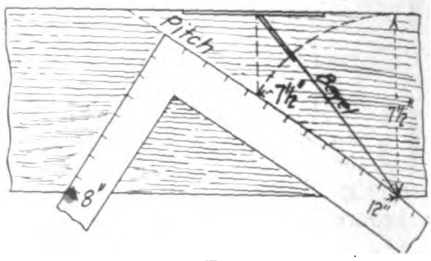
In common experience a workman is assigned to a job of cutting hip or hopper lining with no other data than the pitch or batter of hopper, in this situation his knowledge of the method in the text would not extricate him from his difficulty. Hopper lining—or sheathing, is usually square edge stock and as such a mitre must be found to apply upon this square edge. For this purpose Fig. 2 is submitted. If repetition is permissible, remember that any inclined wall with a flat, level surface at its top, is mitred to form a square as though the wall was perpendicular. This disposes of the need of finding such mitres and as for butt joints—they are not practical on any flattened pitch and are tabooed where practicality exists in good work shops. And further, there is always danger of overstocking the average workman's storehouse of knowledge, the result of which tends to confuse and produce errors. And, among all people, there is danger of putting too much before them at one time.—**C. A. Doner.**



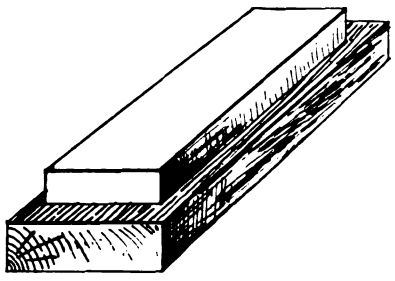


Fig. 2

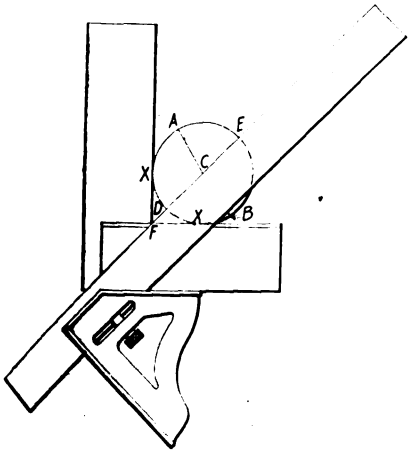
Easily Made Mounting for Oil Stones

EVERY oil stone or hone should be mounted by setting in a hardwood box or case mortised out to receive it like the attached sketch. If the stone is one inch deep and one and one-half inches in width and say six or seven inches in length, of a good quality Washita, carborundum, emery stone, it is worthy of a case or boxing. Let the lower box be of oak, cherry or mahogany wood about 1⅛ inch thick and mortised out ½ inch for half of the stone, so it will fit tightly into it level and true. The cover is similarly made and mortised to fit to a close dust-proof

Digitized by Google

joint and be hinged to the bottom case at one end so as to keep the abrasive surface clean and free from grit or dirt. On the top side of the cover or lid the soft tongue of an old laced shoe may be affixed with cold glue to form as it were a strop to make the edges of



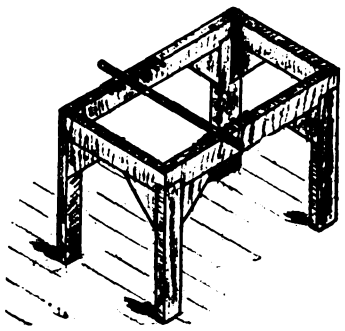
chisels, plane irons, cutters, etc., very keen and remove the wire edges. All should be oiled or polished.

All rectangular, oval or round whet bench stones should be encased or mounted to avoid breakage from falls, etc.—**Owen B. Maginnis.**

Finding the Center

ENCLOSED is a drawing of a little kink that I have found useful in obtaining centers on round work when the ordinary combination square was at hand, but without centering head.

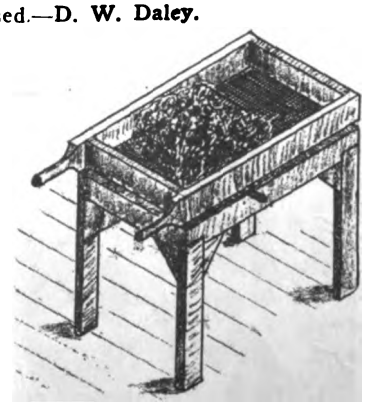
Place the combination square over the trisquare as shown, taking care that the two blades cross exactly at F, the inner corner of the right angle.



Place the two squares on the end of the pole or shaft to be centered, and draw a line across the face of the work. Revolve the shaft, and draw another line. The result will be lines A, B, and D, E, crossing at C, which is the center of the circle.

This same idea can be used in connection with nearly any two try and miter squares, taking care to see each time that the lines drawn across the work, start exactly in the interior angle of the right angle.—**C. E. Kelly.**

HAVE you ever used any machinery or device which has saved you time and money? Have you ever invented any way of doing a piece of work quicker? If you have BUILDING AGE and THE BUILDERS' JOURNAL wants your experience, and will pay regular space rate for it.

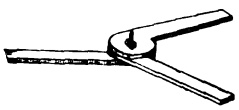


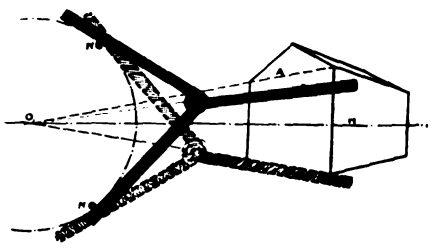
Your description should tell just how you saved time and money, either by a special way of using machinery or by short cuts in construction. Point out what methods you were using before adopting your "Time Saver" and show how your new method turns the trick. You can submit as many articles as you want.

Address The Editor, BUILDING AGE and BUILDERS' JOURNAL 920 Broadway, New York City.

Screening Sand

THE enclosed views show an interesting method of screening sand which we are using on a building here. I am sure it will be of interest to many of your readers. A rigid frame is made as indicated by view "A" in the top rail of which small nails (not over 6 penny) are partly driven and then bent over as indicated. A broom handle is placed on top of the frame to act as a roller under the tray. The tray is partly filled with sand and rapidly moved forward and backward on the broom handle roller, which in passing over the nails causes the tray to go up and down sufficiently to cause the sand to rapidly pass through the screen. We find this method better for wet sand than the inclined screen which is commonly used.—**D. W. Daley.**





Perspective Drawing Short Cut

IN drawing architectural perspectives, it very frequently occurs that the vanishing point O falls off the paper and beyond the drafting board. The following original device is a contrivance which will save one the laborious task of locating the vanishing point every time a line is drawn.

As shown in the illustration, the device consists of three blades so constructed that the one edge of each blade will pass through the center, if projected. The blades are movable and a thumb screw keeps them in position when they are adjusted. Quite often the vanishing point is beyond the limits of the drawing board, and with this device in use one does not have the difficulty of building out some contrivance on the board to locate the vanishing point.

To use this contrivance, which I have called the Y, only one line from the object to the vanishing point must be drawn. Then insert two nails N so that two of the blades will just touch and move about them. The third blade is made to coincide with the given line A and adjusted so that it also coincides with the horizon line H. By trial it will be very easy to get the Y in the proper position and the nails placed. Care must be taken to see that the proper edge of the blades are used, namely, those which are on center.

The Y device is based on the fact that the nails are on the perimeter of a circle whose center is at O and identical with the vanishing point. Two of the blades are always tangent to the circle and the third blade is parallel to the given line which passes through the center O. Therefore, the device in any position will have the two blades tangent and the third blade in such a position that it will always pass through the center O if projected and all vanishing point lines can be drawn without locating the point O every time.—**Albert Korte.**

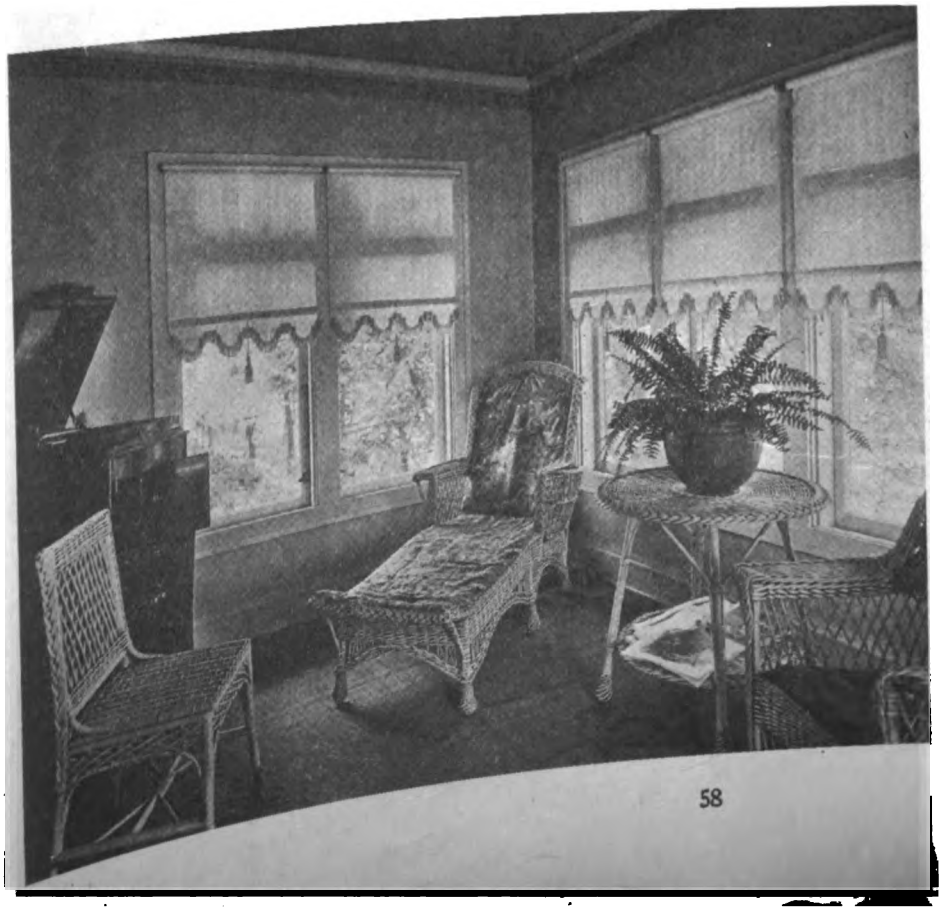
Building the Sun Parlor

MODERN homes, to be complete, must have sun parlors or enclosed porches. Frequently, these are so arranged that screens may be used in the summer and sash in the winter. Of course, for winter use, they should be heated and provision should be made for radiators, registers, etc.

The sun parlor can be of any desired shape—square, oblong, round, hexagonal, octagonal, etc.—all will lend themselves to unique treatment so as to produce an artistic result.



The floor of the sun parlor may be of plain wood, or wood covered with canvas or linoleum in plain color or in tile effects. Another plan is to have the floor cemented and blocked off into squares. Tile is frequently used with excellent results. The choice may be for small tile laid in ornamental designs, or large 6x6 inch or 8x8 inch red quarry tiles. The joints may be close together or separated about 1/4 inch apart, and an artistic effect secured by the use of colored mortar. Very often a pretty design is worked by the use of large and small squares.

The walls of the sun parlor should be the same as the house wall which it adjoins. Do not have a stucco wall on the house and then have the three walls of the enclosed porch covered with beaded wainscot. If the walls of the house are of stucco, the walls of the sun parlor should be made the same. Likewise, should the walls be shingled, the interior walls of the sun parlor should also be shingled. To obtain the best artistic result, the walls should be uniform.

In some cases the walls are plastered, and, of course, decorated with wall paper, but this gets away from the porch look entirely and produces another room. When the walls are plastered, they should have a rough finish, and tinted so as to harmonize with the color scheme desired. The walls of the sun parlor are frequently ornamented with lattice.

The ceiling of the sun parlor should, wherever possible, be pitched, that is, a flat ceiling schould be avoided, since this feature makes the porch appear as a room. If the porch is square or oblong in shape, a hipped roof effect may be given to the ceiling. To have the rafters exposed adds to the appearance of the porch.

In furnishing the sun parlor, a good deal of taste can be displayed so as to produce a harmonious result. Some color scheme should be selected and furniture, hangings, rugs, etc., should be arranged with a thought to the proper effect. Wicker furniture seems to be the most desirable for porch use, it can be supplied with cushions of cretonne or plain material to harmonize. Of course, potted plants lend the touch of color that is necessary by way of contrast.

What the Editor Thinks

Helping the Home Seeker

EVERY family that lives in a rented home must pay rent, and this sum may be applied to the purchase of a home of their own. Every family of this sort is a potential possible customer for the building contractor.

Builders should give particular attention to problems of financing construction, which will mean more business for them if they can help out on this end. Local building and loan associations seem to be the proper source from which to obtain necessary funds for building.

It is to the interest of every community to have new permanent residents settle in their midst. Every merchant will reap the benefit of increased trade. It is up to contracting builders to talk to these merchants and show them the advantage of putting their savings in building loan associations so as to build up their town and add to their own prosperity.

1922 looms before the builder as a year of great prospects and prosperity for the building industry. There is a great need for more homes. These in a town mean more stores, schools, churches and a community building, etc. This will create more work for builders. Boost and build up your town—it pays.

Preventing Strikes

THE Associated General Contractors of America, The American Institute of Architects, The Engineering Council, The National Building Trades Employers Association, and the Building Trades Department of the American Federation of Labor, through the National Board for Jurisdictional Awards, have reached a national agreement through a resolution heavily penalizing union workmen who refuse to abide by the decisions of the Board.

The resolution provides that local building trade councils of union labor shall suspend unions and refuse to recognize or support those unions which refuse to abide by decisions of the National Board, also provides that general contractors and sub-contractors who employ only union labor shall incorporate in their agreements with labor a provision that will secure compliance with all the decisions of the Board and that they shall refuse employment to members of local unions which do not abide by such decisions and, further, that architects and engineers shall insert in all their specifications and contracts a clause that such decisions shall be followed.

This resolution is of far reaching consequence to settle these jurisdictional disputes, which in the past have constituted the majority of the causes for strikes and resulting delays and economic losses.

It is the most effective co-operation between workmen, employers, and professional men interested in construction looking toward the settlement of these jurisdictional disputes without resort to strikes.

Home Building Expositions

WIDESPREAD interest in home building is manifested in the large number of building expositions taking place this Spring.

Practically every city of considerable size has had or will have within a short time, an exposition of some sort dealing with the building industry from the "service departments" in the local lumber yard to the large shows in San Francisco, Minneapolis, Chicago, Detroit, Cleveland, Atlanta, Boston, New York, Trenton, Newark, etc.

The Chicago Show, which opened March 25th and closed April 1st, was a big success. At Cleveland, the American Building Exposition opens April 22 and will continue for 10 days in the New Public Auditorium which has just been completed. The New York Show will also open on April 22d. At San Francisco, the Home Beautiful Exposition opens on April 24th. Truly, the month of April is an Own-Your-Home month.

This all indicates that the public is keyed up to the home building situation. Conditions are right now for building and there is every indication that the year 1922 will go down in building history as a boom year for home construction.

Up-to-Date Homes

ONE of the newest developments we have noticed is that of speculative builders advertising a complete house for sale with all modern improvements, including a Radio Telephone Service, a feature that will add greatly to the enjoyment of these new homes.

Several progressive builders around New York and Philadelphia have hit upon this clever idea to create a desire for their homes.

Tax Exemption Extended In New York

THE housing shortage in New York produced the tax exemption law so as to encourage the building of homes. This law provided that buildings erected, or on which the construction was commenced before April 1st, 1922, would be exempt from taxes for a period of ten years. The time limit has just been extended to April 1st, 1923, but the tax exemption period will expire January 1st, 1932.

This extension of the exemption law will tend to further increase the number of houses to be erected this and next year. Many people were unable to make the start last year, but now, under more favorable conditions, they can proceed to build their own homes.

Own-Your-Home A Good Slogan

IMPRESS upon everyone the idea of "Own Your Home." It helps the building contractor by creating more business, the family owning its own home is more content, and it increases the wealth of our country. As this subject is so popular at the present time, we have devoted practically all our space this month to the Own-Your-Home idea.

This issue of BUILDING AGE and THE BUILDER'S JOURNAL is a good one to show prospective home owners who come to you for advice. There are many helpful articles that will give information which should be mutually agreed upon, so that the building contractor can erect for his clients the house best suited to their individual needs.

CARPENTRY

Good Practice in Frame Construction and Finish

How to Find Cuts for Hips and Valleys

Some Practical Points to Be Observed to Prevent Mistakes

By JOHN PARKHILL

MY observation as a practical builder has shown that there are some important points in roof-framing which are very imperfectly understood—or not understood at all—by the majority of builders.

The weather last summer furnished a very warm topic, but the length of a rafter furnished a much warmer one—to our local carpenters.

Ed Marvin, the contractor on Sam Bryan's new house, has very few equals on roof-framing. For Bryan's house the architect, Tom Wade, had specified four by four-inch hip and valley rafters unbacked. On part of this roof two hips and one valley rafter were required, all three having the same rise and run.

From three timbers all of the same length, Ed was preparing to cut these when Tom came along and remarked that these timbers were long enough for the hips, but too short for the valley rafter. Ed disputed this, the discussion waxing warmer until finally Tom said, "Ed, not only is your timber too short for this valley rafter but when you buy one long enough it will cost you as much as both the hips did. We will prove which of us is wrong and let him buy a bully supper for the boys. Do you agree?" Ed agreed —to what he later termed a rash offer.

The point in dispute excited much more interest than the supper did, but both these attractions combined drew a large and most enthusiastic audience, which included the Carpentry teacher at the State University—Mr. Smith.

Tom, after expressing his gratification at the interest shown, displayed a roof plan of the rafters in question, and explained that as the whole rise of the common rafter is 21 inches, and its whole run just one foot, he proposed to prove that the valley rafter must be more than three inches longer than the hip.

"Gee whiz," exploded one young fellow, "if its over three inches longer for just one foot of run what would it be on the main roof?" "Just the same," replied Tom, "this difference remains the same irrespective of the length of the run. Your remark is quite welcome and any others will be."

"In that case," said an experienced builder, "let me say that I always mark the lengths of hip and valley by the same pattern, as I have assumed that if there is any difference in length it is negligible."

"The same here," spoke up three others.

"I also make these lengths the same," remarked another contractor, "but I always have to chop off the upper corners of the hip for five or six feet at its bottom end."

"Perhaps Professor Smith will tell us what is taught at our University regarding this," requested Tom.

"Please reduce my title to instructor," modestly replied Smith. "Really, this point has not yet come up in our carpentry class. The difference you state seems very surprising and rather unreasonable, but just at present I would not venture to say that you are wrong."

"Tom," said an old veteran, "as this hip and this valley rafter have the same rise and the same run, how then can there be this difference in length?

"That," replied Tom, "is exactly what I am here to demonstrate. Regular, backed-off hip and valley rafters

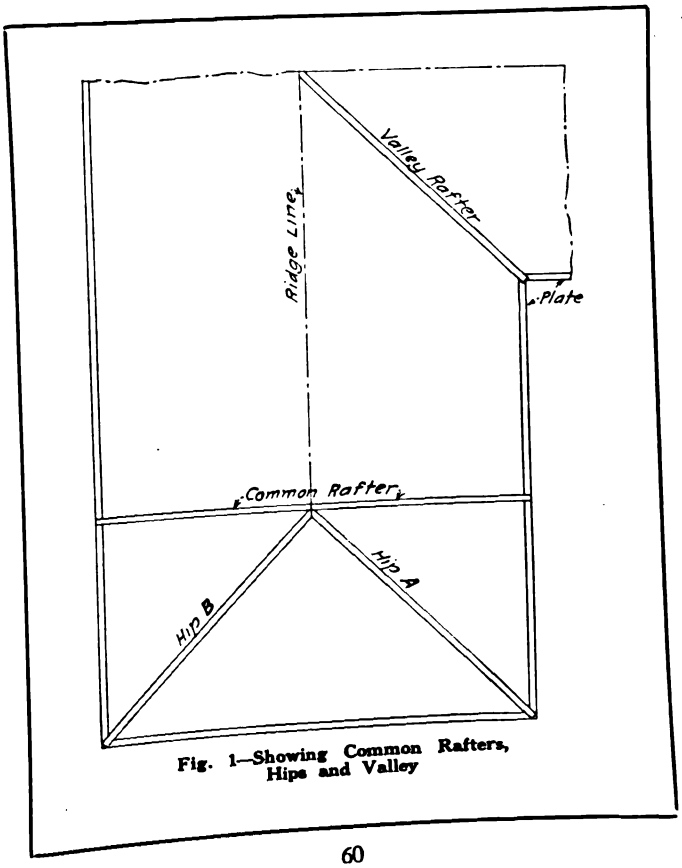

Fig. 1—Showing Common Rafters, Hips and Valley

Digitized by Google

for the same rise and run are the same length, and the center line along the top edge of each lies in the same plane as the top edges of the common rafters. This plane coincides with the under side of the roof-sheathing. With unbacked rafters this plane still passes through this center line on valley rafter, but not through that of the hip.

"It passes through the corner of an unbacked hip, and to bring the corner into this plane the hip must be shortened. This may be plainly seen in Fig. 1 where the center line of the valley rafter reaches to the outside edge of the plate but that of hip A does not.

"The length of the hip as you builders say you make it—as perhaps most builders make it—is illustrated by hip B which is shown the same length as the valley rafter, with its center line reaching to outside edge of the plate.

"But it is quite obvious that the corner of hip B on which the sheathing must rest now stands above the plane in which the sheathing belongs —more than two and three-eighths inches above plumb up.

"One" tells us that he remedies this by chopping off the top corners of hip for five or six feet at its bottom end. But why stop at six feet?

"With a straight hip he must chop for its whole length. This, if accurately done, gives a backed-off hip —which is not here specified.

"Contrary to the general belief, it is not difficult to determine this difference in length between unbacked hip and valley rafters as Fig. 2 will help us to see.

Half the thickness of hip from S in Fig. 2, mark a point X on the horizontal cut. Then with S X O a right angle O S is this difference in length, 3.182 inches.

S N is the length of the valley rafter, 27 inches.

O N is the length of hip A, 23.818 inches.

The hip B, as improperly represented in Fig. 1, stands 2.474 inches (equivalent to X O) above its proper position which is shown correctly by hip A in Fig. 1.

The horizontal cut of unbacked hip always lies in O P Fig. 2, while that of the valley rafter lies in S T.

A gauge line through the point X gives the depth of backing. Many advise the backing off of these rafters. I don't because the labor cost is very much more. If not accurately done the rafter is seriously damaged, weakened to the extent of more than nineteen per cent. in the present instance!

"Now," said Tom, "will my friend Ed tell us whether he still disagrees with me?"

In response Ed got up and said: "Tom, since you were at the house I have cut and placed those rafters, and they fit perfectly. I must admit that I was rather surprised to find so much difference in the lengths, but these were just exactly as you have stated them."

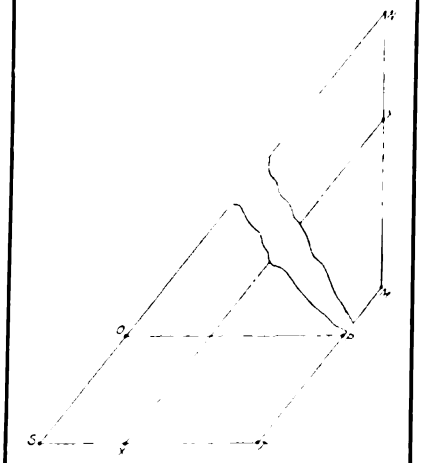

Fig. 2 Showing
Valley Rafter=S N=27 inches long
Hip rafter A=O N=23.818 inches long
Difference in lengths=S O=3.182 inches.
Depth of Backing=X Y
Horizontal cut of Valley Rafter=S T
Horizontal cut of Hip Rafter=O P
Plumb cut of each=NM
Half thickness of Hip=S X=2 inches
X O=2.474 inches
S X O=right angle

"My two-foot timber being too short I had to buy a four-foot piece which, of course, cost me just as much as both the hips did. You gain your point, but what I gain is worth much more to me than what it costs, so I don't envy you the least bit."

"Isn't Ed a good sport," Tom teasingly remarked, "he is the first man I have known to cut a hip rafter properly, and I have planned and superintended many buildings."

"I strongly urge you all to get better acquainted with roof-framing," continued Tom. "It is a fascinating study and will furnish you many surprises.

"For many years the Mormon Tabernacle has furnished an example of a most remarkable roof, as being the largest self-supporting wooden roof in existence. But a roof recently built at Rochester, Minnesota, is by far the most remarkable that I have any knowledge of. In this, a plain roof with straight rafters, no ridge board, and with regular hips, the common rafters are longer than the hips."

"Gee whiz, that's a little too strong, Tom," remarked my helper, who had just kept quiet all through this highbrow discussion.

"Yes, I have no doubt that the rest of you feel like 'whizzing' too, but I have a diagram here and I can show—" Here Tom felt a gentle shove and some one earnestly whispered in his ear. "Boys," he resumed, "I can show you the way to supper; it's ready, let's go."

PROBABLY no part in the construction of buildings so thoroughly taxes the skill and ingenuity of the builder as the framing of roofs," says Mr. I. P. Hicks in his book, "The Builders Guide." "Many diagrams have been published from time to time showing how to find the lengths and bevels of hips, valleys, and jacks on all kinds of roofs. Yet many of the plans heretofore published have been too complicated to satisfy the wants of the inexperienced in the art of roof framing."

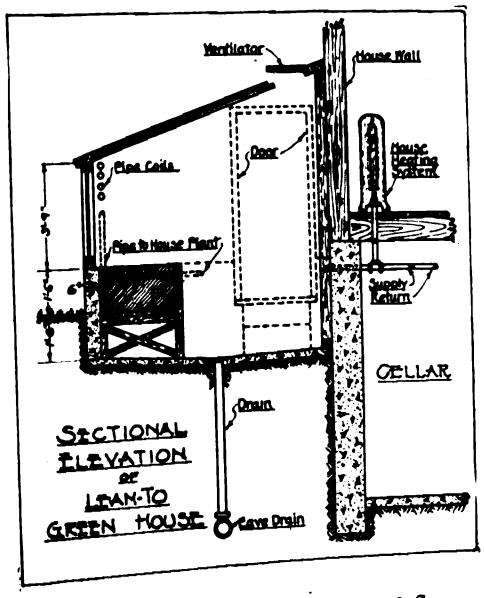
The lengths and cuts of any rafter, hip, valley or jack on roofs of any pitch may be easily found by a proper application of the steel square and 2-foot rule.

There are a few simple facts which, if remembered, will serve to make hip and valley roof framing so plain and easily understood that no one need have any difficulty in finding the length and cut of any rafter.

The pitch of a roof is always designated by the number of inches it rises to the foot run, hence the cut of a common rafter is always 12 for the bottom cut and for the top cut is the rise of the roof to the foot.

The cut of a corresponding hip or valley of equal pitch is always 17 for the bottom cut and for the top cut the rise of the common rafter, 17 and 8 will cut the hip or valley.

The top bevel of a jack rafter is always 12 on the tongue of a square and the length of the common rafter for a foot run on the blade.



The blade gives the cut. In other words, the run of the common rafter on the tongue and the length on the blade will always give the top bevel of jack rafters on roofs of equal pitch. The plumb cut or down bevel of a jack is always the same as that of the common rafter.

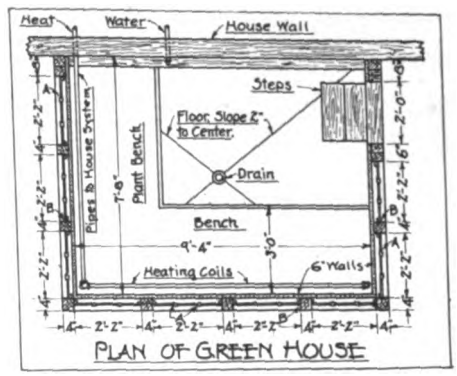
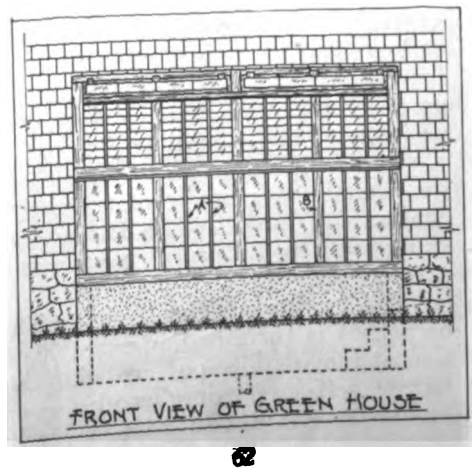
How to Build a Small Greenhouse



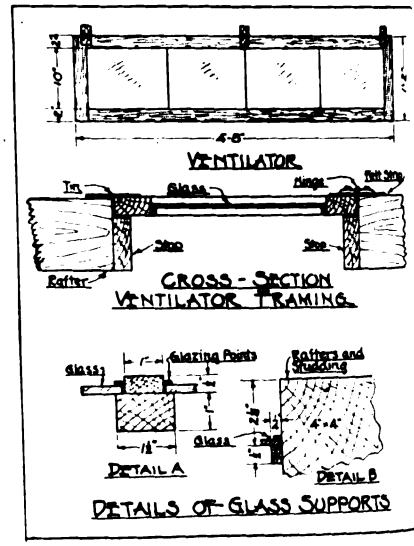
By FRANCIS DASHIELL

THE green house which is described in this article is designed especially for the average home, being constructed of the lean-to type alongside of the dwelling house on a southern exposure. The house wall is to be desired for building the greenhouse beside because of the warmth, protection and the proximity to the heating source. The green house provides the ideal conditions so necessary for the safe keeping of tender or tropical outdoor plants and bushes which must be kept at a temperature above freezing throughout the winter season and



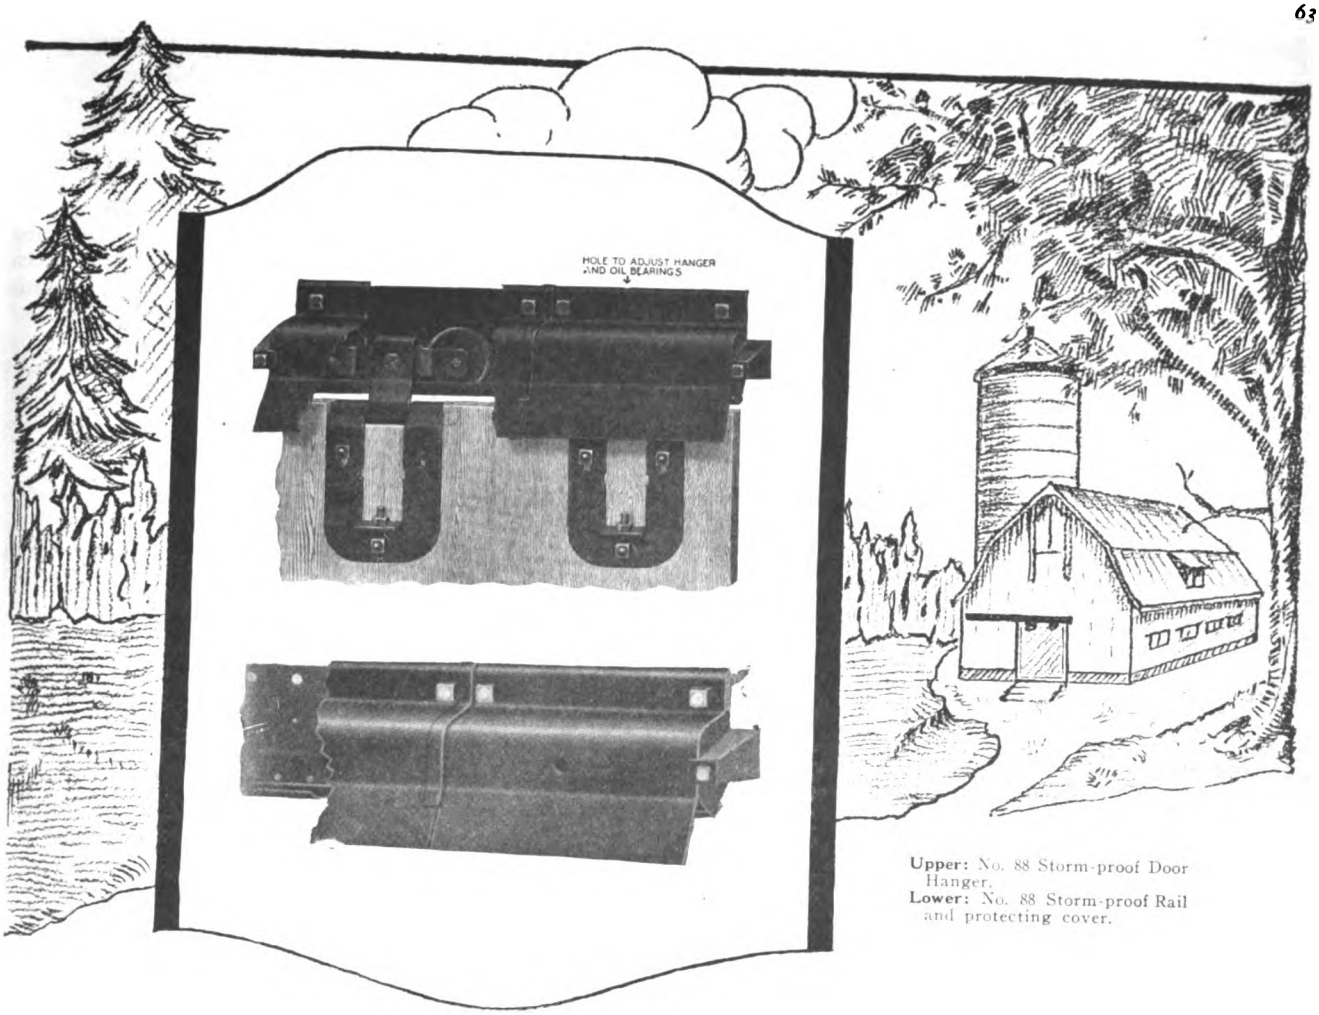
for the forcing and growing of flowers and vegetables under glass.

The greenhouse should be provided with a slight basement eighteen inches below the surface of the existing grade. The foundation walls should be of concrete and six inches in thickness extending 18" above the surface of the ground, making a total inside height of three feet from the floor to the top of the wall. A concrete floor should be made sloping towards the center, a pitch of two inches being sufficient to provide ready drainage. An iron drain fitting with a strainer is set in the center of the floor and connected down to a local drain pipe, such as the eave spout or rain water drain. A door-way opening as shown is provided for on the east end of the foundation wall, or any other position which is protected from the prevailing wind direction.



The total outside dimensions of the greenhouse are 10'-4" in length and a width of 8'-2". The front height is 5'-3" and the rear is 8'-7", being taken from the outside ground level. The inside dimensions are 9'-4" by 7'-8" with a height of 6'-9" at the front and 9'-9" at the rear, measuring from the floor level. This provides plenty of clearance all around the inside walls under the rafters of the roof.

The sills, studding and rafters are of 4" by 4" lumber. This may seem somewhat heavy for this type of construction, but stiffness is required in order to obtain strength as much bracing is impossible. The studding and rafters are set up on 2'-6" centers as shown in the plan. Each of the spaces between them is filled in with three rows of 8" by 10" standard hot bed glass. These panes of glass are carried upon supports made up of two pieces of material of suitable length, one piece being 1" by 1½" and the other ½" by 1". These two are nailed together and provide a ¼" supporting surfaces for the glass as shown in Detail "A." The supporting of the glass edges upon the rafters and studding is accomplished by nailing a strip ¼" by ½" along the inner edges or sides of the rafters and studding shown in Detail "B."



Two roof ventilators are necessary and are made as shown in the detail and will require four pieces of glass 10" by 14" to each. These windows should be hinged to the outside of the roof and swing upwards. Suitable hooks should be provided so they may be adjusted from within. The cross section drawing illustrates the method of making the water tight joint between the roof and frames when closed.

The structure must be supplied with heat during the winter and on cold nights. The most simple scheme for heating a green house is by means of a pipe coil. It should be suspended around the outer walls of the house and connected to the main house heating plant. These connections can be made through the basement wall to the nearest lines of risers of supply and return mains in the cellar. The pipe coil in the green house must be placed at a somewhat higher level than the supply pipes in the basement so as to allow for

Upper: No. 88 Storm-proof Door Hanger.
Lower: No. 88 Storm-proof Rail and protecting cover.

EVERY building having large or heavy sliding doors—whether barn, warehouse or industrial building—should have only the best possible door hanger and rail.

Particular attention should be paid to the storm-proof and lasting qualities of the hanger chosen, to the simplicity and strength of construction, to its capacity, to the design of its roller bearings, the distribution of load, to the rigidity of the hanger and its adjustability—both vertical and lateral.

All of these factors have been given thorough consideration and incorporated in the design of our No. 88 Adjustable Storm-Proof Door Hanger—the two-adjustment model, simple and easily operated.

For use with this model Adjustable Storm-Proof Door Hanger we have designed the Storm-Proof Rail and its protective cover. Strongly built—this rail has found universal favor in this country and Canada, attested to by steadily increasing sales for use under every imaginable condition.

This rail fits close against the building, is storm and bird-proof and requires no brackets or splice covers.

Catalog on "Builder's Hardware" describes completely the above and other models. Send for it today.

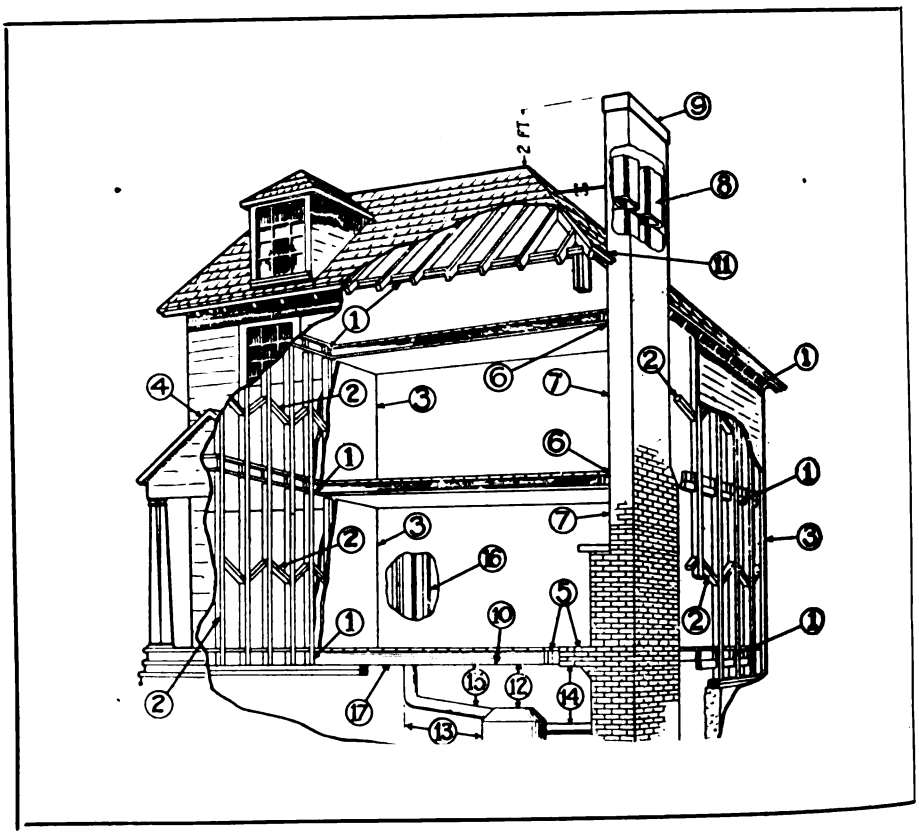
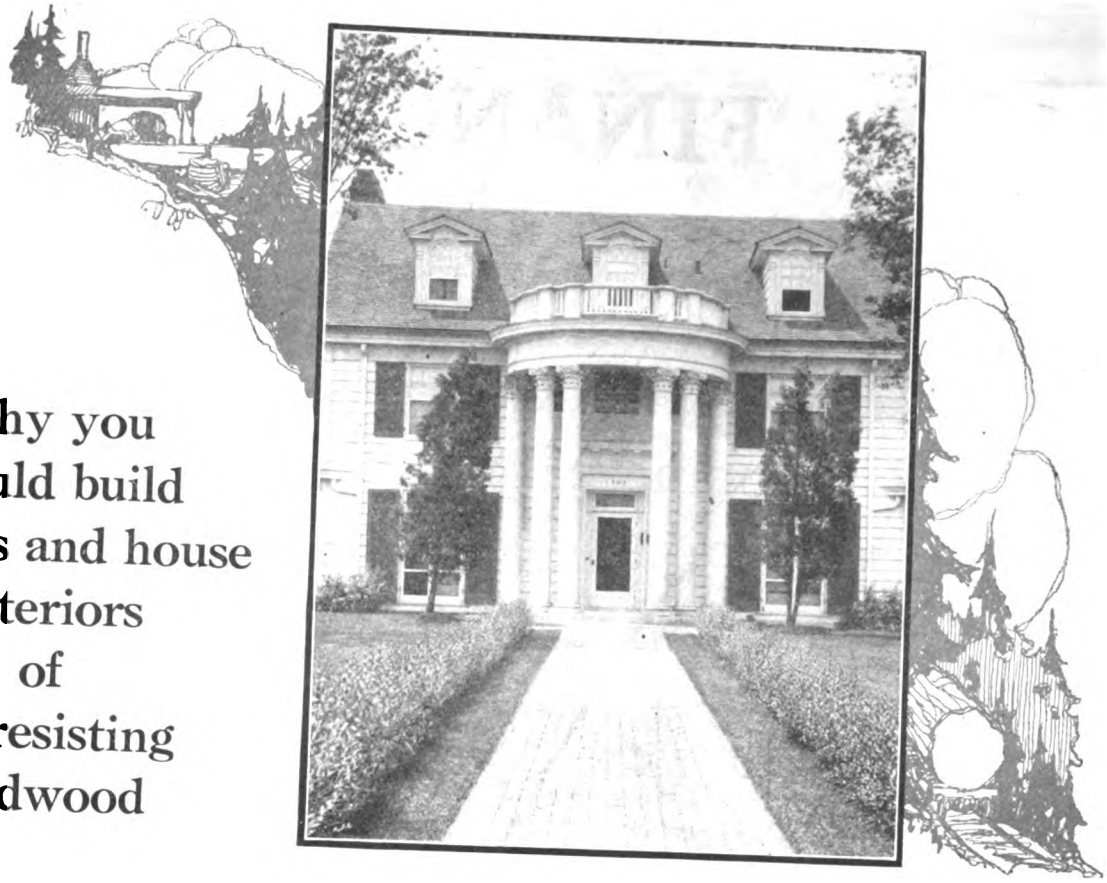
proper drainage. The radiation for this building is approximately 100 square feet. Very often during the day the heat will have to be turned off as the rays of the sun will provide all necessary heat. The addition of this small quantity of radiation to the house plant should not be harmful, as all plants are designed with allowances for overload in case of additions to the installation.



A box or bench is built all around the sides of the house and filled with rich brown loam for growing the plants and vegetables in. Suitable hooks and shelves are to be placed to take care of potted and hanging plants. A ½" water line from the cellar and fitted with a faucet is useful for watering the vegetation in the mornings with a fine spray from a hoze nozzle.

Fresh air admitted to a green house daily is a necessity, except during very bad weather. The proper use of the ventilators and the door will soon be learned after practice. A thermo-electric device for regulating the heating coil valve will be a valuable addition towards lessening the labor of operating the green house and will do much towards keeping the temperature uniform.

Construction Diagram of Fire Resistive Frame Houses



DURING the past year the most competent engineers in the lumber industry have been working out improved designs in frame construction with a view chiefly to the reduction of the fire hazard to a minimum. So successful has been this work that the authoritative announcement has just been made that through better building methods, and at very little increased cost, the danger from fire in frame houses has been reduced 50 per cent by reason of improvements in construction. In all respects these houses are similar in appearance to those of usual construction, but they possess many, and for the most part hidden, protective features that make them essentially fire resistive.

The accompanying diagram graphically illustrates many of these modifications in construction. It will be observed by noting the numbers indicated and the reference below, that fire stopping is of primary importance. This means the interposing of panels and short pieces within spaces that ordinarily serve as flues for rapid spread of combustion. Most of the other improvements are protective in their nature and prevent wooden parts catching fire from chimneys, fire places, heating plants, steam and hot water pipes, etc. While, of course, wood will burn, it is also true that there is no such thing as a "fireproof" house within the reach of the ordinary pocketbook. What is now offered is an economical type of construction that is fire resistive and as nearly fireproof as frame construction as now developed can be made. It conforms strictly to the scientific building codes of the most progressive cities and carries a minimum of fire risk to the occupants.

(1) Fire stopping at all intersections of walls and partitions with floors, ceilings and roof.
(2) Herring bone fire stopping in partitions midway between floor levels.
(3) Partition and wall corners framed solid.
(4) Wall between porch attic, and house sheathed solid.
(5) Header beams 20 inches from the fireplace breast. Incombustible hearth.
(6) Wood members 2 inches from chimney, space between filled with loose incombustible material.
(7) Plaster applied directly to chimney breast.
(8) Flue lining in chimneys.
(9) Top of chimney 2 feet above peak of roof.
(10) Protection over heating plant.
(11) Roof framing 2 inches from chimney, flashed, permitting free movement of chimney.
(12) Top of heating plant 15 inches from ceiling.
(13) Furnace 8 feet from warm air riser.
(14) Smoke pipe 1½ times its diameter below the ceiling.
(15) Heat pipes 6 inches below ceiling.
(16) Doubled tin pipes, 1½-inch air space between in partitions, kept 1 inch from all woodwork. Steam and hot water pipes 1 inch from woodwork.
(17) Heat pipes running through floors fire stopped with asbestos, etc.

Why you should build porches and house exteriors of rot-resisting Redwood

THE USE OF REDWOOD for porch columns, railings and balusters, for the house siding from water tables to eaves, the shingles of the roof and the gutters, is a guarantee of permanent beauty and low repair costs.

These T. P. L. Co. specialties are made from selected and properly seasoned Redwood and are manufactured to the most rigid specifications. Because of its *natural,* odorless preservative, Redwood resists all forms of rot and decay. Properly seasoned, Redwood can be depended upon not to warp, swell or shrink. Redwood contains no pitch or other highly inflammable substances and therefore reduces the fire hazard wherever used.

Practically all T. P. L. Co. mill work carries our trademark. Our sidings are square-ended at the mill, saving waste of both labor and material on the building operation. Each bundle is stenciled with our trademark, its surface measure and grade.

Redwood lumber and mill work for exterior construction does not add greatly to the cost of a building. It does add a lot to its real value as an investment. It makes houses easier to sell at a profitable figure.

For the convenience of builders and architects we have recently issued our "Construction Digest" and our "Engineering Digest," which our Chicago or New York office will gladly forward, together with mill work lists of Redwood items of our manufacture. Write for them.

Redwood should be specified for

Exterior Construction

Including Colonial siding, clapboards, shingles, door and window frames, gutters, eaves, water tables and mudsills, porch rail, balusters and columns, mouldings and lattice.

Pickets and fencing.

Pergolas and Greenhouses.

Interior Finish

Natural, stained or painted.

Industrial Uses

Tanks and vats for water, chemicals and oil.

Factory roofs and gutters.

Wood block flooring.

Wood Specialties

Such as Caskets and burial boxes.

Incubators and ice cream cabinets.

Cigar and candy boxes, etc.

Railroad Uses

Such as Railroad ties and tunnel timbers.

Signal wire conduits and water tanks.

Car siding and roofing.

Farm and Dairy Uses

Such as Silos, tanks and troughs.

Hog feeders and implement sheds.

Wood block floors, etc.

FINANCE and REAL ESTATE

Helpful Data for the Builder Who Builds to Sell

Financing Home Ownership

BUSINESS methods should prevail in home building, as well as in other thnigs. Many people have been ruined financially in trying to own a home of their own simply because fundamental business principles were entirely neglected.

The greatest fault is to attempt to own a place that is too large and costly to keep up. People that have been cooped up in a three or four-room apartment for ten to twenty years get the idea that they can own a home of their own at less money than they are paying as rent to a profiteering landlord, which is true, but then they expect to have a ten-room house with extensive grounds, garage, etc.

It costs money to own a home of your own and this should be carefully considered in relation to one's income. One should have a reasonable amount of money to begin with as it will, therefore, cost less to carry it.

A very sensible plan of figuring is to put down all the items of expense, including interest on the money you have invested. This will actually show you how much your house is going to cost.

It is a wise plan to mark down the items of cost in the following form:

Interest on investment.....$.....
Interest on mortgages.....$.....
Taxes and assessments.....$.....
Dues to local improvement Association .....$.....
Repairs .....$.....
Insurance .....$.....
Depreciation .....$.....

Total annual cost of upkeep $.....

If you add these items up the result will be the total annual cost of your house. If you have enough cash on hand to pay for everything, of course, the problem of financing need not be considered, but very few are fortunate to be in this condition.

The simplest plan of financing is to obtain a first mortgage as it is termed, on the property and building. If a sum up to 50 per cent. of the combined value of the lot and building is desired, there is usually no trouble in obtaining the loan.

Where, however, one has a limited amount of money a Building Loan Association seems to offer the best possible way of financing a home. In nearly every locality you will find some Building Loan Association and they will always be willing to make a loan if the investment seems desirable.

Building Loan Associations

IN the majority of Building Loan Associations the member pays $1 per month for each $100, or $10 per month for each $1,000 borrowed, and continues the same monthly payment until the loan is fully paid. From this monthly payment interest at six per cent. on the amount of the loan is deducted and the balance is applied directly as a payment on the principal. The following month, the sum deducted for interest is less than the preceding month, while the sum credited to the shares of the loan is greater. By this system the borrower reduces his interest charges monthly, and while he continues to make the same monthly payment, he is charged interest each month only on the actual amount of his loan still unpaid.

By this method a loan is paid for in 139 months or 11 years and 7 months. This looks like a long time at the start but time will fly fast enough. One must remember that the rent is due every month if one continues to live in a rented home.

Under the monthly payment plan the time of total payment is fixed, and there is no cost or annoyance of renewal as is the case with a straight mortgage for a few years. The Building Loan Association plan does not interfere with the sale of property in any way as the mortgage can be reduced to any amount, or paid in full at any time.

Monthly payments on building loans are required only on the sums actually advanced, and the full payment does not commence until the house is completed. The cost of obtaining a loan including mortgage tax, and all expenses, is from $100.00 upwards. The applicant is required to furnish a survey of the property in all cases.

Here are figures of a person paying, say, $30 per month, buying a house for $4,000. If he should buy the property, paying $1,500 cash, and take a Building Loan Association Mortgage for $2,500, the result would be:

Paid Cash	$1,500.00
Paid $25.00 per month on mortgage for eleven years and seven months	3,475.00
Taxes	440.00
Repairs and Fire Insurance	550.00
	5,965.00
Deduct rent, he would have paid same length of time	4,170.00
And the home has cost only	$1,795.00

In other words, a $4,000 house has been bought for $1,795 and that is certainly a good business investment.

"Made to Walk on"

You know Johnson's Floor Wax. It is used all over the civilized world. We want you to know and use our Floor Varnish, too. It is of the same high quality as our Floor Wax. To prove this statement we are offering you a pint can absolutely free—all charges prepaid.

Johnson's Floor Varnish dries dust-free in 2 hrs. and hard over night. It imparts a beautiful, high lustre—has good body—will give long wear—is absolutely waterproof—and will stand all reasonable tests.

JOHNSON'S FLOOR VARNISH

Johnson's Floor Varnish is just the thing for hard and soft wood floors—oil cloth and linoleum. Also for furniture, woodwork and trim of all kinds.

Johnson's Floor Varnish is tough and durable. It gives a beautiful, high gloss which will not chip, check, mar, blister or scratch white. It is very pale in color so can be used on the lightest floors and linoleum. May be rubbed if desired.

FREE TO CONTRACTORS

Fill out and mail the attached coupon for a pint of Johnson's Floor Varnish free and all charges prepaid. There is no obligation whatever connected with this offer. All we ask you to do is use it and compare it with other brands.

Legal Department

ALL readers are invited to ask any questions that will help them solve any legal difficulty that they may be in. Our legal adviser will answer direct by mail and give his opinion as to the correct procedure. Questions and answers of general interest to the trade will be published in these columns. All inquiries must be accompanied by the name and address of the correspondent so that he may be answered direct or that he may be requested for further information if necessary to the intelligent answering of his question. No names will be published, only initials or a nome de plume. Remember that this service is free to subscribers. Address Legal Department, Building Age and the Builders' Journal, 920 Broadway, New York City.

A BUILDER from New Jersey writes for information concerning his legal rights under the following states of facts. He negotiated to construct a building and furnished a set of plans, but it seems that no final or signed contract was entered into. The owner later misrepresented to the builder that the real estate had been sold; thereby apparently inducing the builder to reconcile himself to loss of the contract. But still later the owner, or rather his wife whom we infer to be the real owner of the property, contracted with another builder for erection of the building. The plans mentioned were copied and filed with the municipal tenement house department. The architect copied the plans because informed that settlement had been made by the owner with the first builder. The question presented is what redress is available to the first builder. Is he entitled to loss of profits through having let other work go in order that he might be in position to complete the proposed work on time?

Rights of a Builder Where His Plans Are Used

So far as loss of the construction work is concerned the law applying is clear and simple. If no definite and final contract was entered into there is no valid claim for loss of contemplated profits in erecting the building. Until such a contract is finally made there is no mutually binding obligation. The builder may freely terminate the negotiations and decline the work. And the owner has the reciprocal right to refuse to proceed, without regard to his reasons for doing so. Until a final and definite contract is entered into the builder takes the risk of losing all time and expense incurred in seeking to secure the contract, no matter how great may be the loss to him.

As to the plans used by the owner we believe that a valid claim may be enforced against the husband and wife jointly for the reasonable value of the work done by the first builder and so accepted in the erection of the building by the second builder. Counsel for the first builder will find a summary of the law on this subject at pages 260-263, 5 Corpus Juris.

The first builder would probably have had no valid claim had the plans been rejected or had the owner wholly abandoned the proposed building. But we believe that the first builder has a valid claim against the owner or owners for the fair value of the services rendered by him and actually used in the construction of the building by the second builder.

IN the recent case of Reynolds & Maginn vs. Omaha General Iron Works (180 N. W. 584) plaintiffs were awarded damages for breach of a contract to furnish structural steel, etc., to plaintiff contractors for use in erecting a school building in Nebraska.

Validity of Informal Contracts

Among other points decided by the Nebraska Supreme Court in affirming the judgment, it is decided that a letter by a dealer in building materials, sent to a contractor and stating that in the event of the contractor becoming the successful bidder for work the dealer will furnish the required materials at certain prices becomes a valid contract on the contractor accepting its terms.

And, as applying to cases where all the terms of an agreement have been informally agreed upon but a formal contract contemplated by the parties has not been actually entered into, the court follows the rule laid down by the Appellate Division of the New York Supreme Court:

"The law undoubtedly is that an informal agreement complete in its terms will take effect if the parties so intend, though a more formal contract is expected to be afterwards made, provided that the formal contract is not to contain material provisions not contained in or to be inferred from the preliminary informal agreement."

IN the case of Wright vs. McAdams Lumber Co., 234 Southwestern Reporter, 878, the Texas Supreme Court approves a conclusion of the Commission of Appeals of the state, to the effect that the act passed by the Texas Legislature in 1915, providing that "no change or alteration in the plans, building, construction or method of payment shall in any way avoid or affect the liability" on a contractor's bond, is void as unconstitutionally interfering with the right of freedom to contract. So it is found that the law remains unchanged in Texas that a material change in the terms of a building contract, without the assent of the contractor's surety, relieves the surety from libiality. The opinion reaffirms the rule stated in 21 Ruling Case Law, 1004, par. 53:

Liability of Surety Where Builder's Contract Is Changed

"The contract of the surety . . . . demands that he be dealt with in the utmost fairness and good faith. He cannot, therefore, either at law or in equity, be bound further or otherwise than he is by the very terms of his contract, and if the parties to the original contract think proper to change the terms of it without his consent (which, it is not disputed, they have a right to do), he is discharged. When his contract is changed without his knowledge or authority, it becomes a new contract and is invalid, because it is deficient in the essential element of consent."

Speaking of the contract before the court, the opinion adds:

"Neither the contract nor bond contains a provision authorizing the changing of the contract without the consent of the sureties, except that the original contract provides that the owner might make any alteration by adding, or deviating from the plans, drawing, and specifications of the architects he should deem proper and the architects should advise. Clearly the exception limits the alteration to the plans, drawing, and specifications by the architects, and has no reference to changes otherwise."

The court holds that the sureties in this case were discharged by changes in the building contract involved, whereby the contractor was obligated to hasten performance and the price was changed; these changes being made without the consent of the sureties.

Proving Value of Architect's Services

THE necessity for making specific proof of the value of architectural services when it is sought to recover compensation for such services by suit is indicated in an interesting case recently before the Wisconsin Supreme Court. (Tullgren vs. Karger, 181 N. W. 232.) It is held that the ordinary bases of an architect's charges are not so generally known as to enable a judge or juror to fix a basis where none has been expressly proved in the trial of the cast. The court goes farther by saying that the fact that the judge or jurors might have personal knowledge on the subject could not be used as a substitute for specific proof.

It seems that after plaintiffs, Milwaukee architects, had rendered preliminary services, including consultations, drawing sketches, plans, etc., and receiving proposals for the construction of the building projected by defendants, defendants abandoned the idea of building. Dispute arose as to what amount was due plaintiffs for their services, and suit followed. Defendants tendered judgment for $200, but the offer was rejected, and the case was tried. The trial judge found that $1,750 was due plaintiffs, but the Supreme Court has reversed this judgment, holding that plaintiffs, by failing to prove the value of the services rendered, precluded themselves from recovering more than the $200 which defendants had offered to pay.

The theory of the higher court's holding is that proof offered on the part of the architects that it was customary in Milwaukee to pay architects 3½% upon the approximate cost of the building involved was unavailable as a basis for awarding compensation in this case, because the services rendered were not of the nature covered by the usual 3½% contract. The court said:

"It was of course incumbent upon plaintiff if entitled to recover under either theory of the case to present to the court competent evidence upon which a proper assessment of damages might be made. . . . The value of such services as were here rendered by plaintiffs was not a subject of general knowledge, or such as come within the wide field wherein courts take judicial notice of certain classes of facts. The very nature of plaintiff's evidence as to the value of such services shows that the proper proof of the measure of compensation in such matters is peculiarly one requiring the evidence of those familiar as experts with such work and the customary pay therefor in the particular locality where rendered. . . . Though a trial court has particular personal knowledge or experience in such line of work from which he would be qualified to form a judgment upon such a matter, even then such particular personal experience could not be used as a basis for making such a finding. Neither jurors nor trial courts in arriving at their conclusions of fact in any particular case can properly act upon their special individual knowledge as to matters which are not of common knowledge."

To What Extent Is An Architect An Owner's Agent?

AN architect is not, simply as such, a general agent." declared the Washington Supreme Court in the recent case of Columbia Security Co. vs. Aetna Accident & Liability Co., 183 Pacific Reporter, 137.

Plaintiff, owner of a building at Pullman, Wash., contracted to have it remodeled. The contractor gave a bond to indemnify plaintiff against labor and material claims. Plaintiff was required to pay certain materialmen's claims to protect the property from liens, and sued to hold defendant as surety on the bond. The trial judge denied recovery, and plaintiff appealed to the Supreme Court, which has reversed the judgment, directing that plaintiff recover on the bond.

One of the defenses relied upon by the surety company was that it had been relieved from liability, because, without its consent, the plans and specifications had been so changed as to increase the contract price more than twenty per cent. of the amount called for by the bond. But the Supreme Court overrules this claim, on the ground that any such change was made by the supervising architect without the owner's knowledge or consent. It is held that action of an architect not authorized by the owner is not binding on the latter.

The opinion quotes clauses in the building contract, under which the work was to be done according to "the direction of said architect," and reciting that materials condemned by the architect should be removed, and that the architect's "decision in matters concerning the intent and meaning in interpreting drawings and specifications shall be final," etc. It then appears that the changes made at the instance of the architect consisted in the substitution of larger iron beams than were called for by the contract and specifications. The owner was not apprised of this change until the beams were being installed, and it was not practicable to have them removed. In this view of the case, the opinion says:

"An architect is not, simply as such, a general agent. He and all third persons dealing with him are bound by the general rules of agency. In the present case he had no authority to bind plaintiff [the owner] beyond the terms of the contract with Schuster [the contractor]. The authority conferred was limited and defined. It was special and not general. The work to be done under the direction of the architect was the work mentioned in the contract which in the respect in question was made definite and certain by the specifications. His power to condemn and order taken down and removed from the grounds all material as unsound or improper, or as in any way failing to conform to the drawings and specifications, falls far short of giving him any right to recast the drawings and specifications, upon a matter already perfectly clear and explicit, by substituting something else so increasing the total cost that standing alone would threaten, if not defeat, his employer's rights under the literal terms of a bond given to indemnify and assure the employer that the cost of the work would not exceed the amount mentioned in the contract. It was provided that all materials should conform to the specifications, that is, the specifications which were a part of the contract; and, while it was agreed that the decision of the architect in interpreting the intent and meaning of the drawings and specifications of the work under his supervision should be final and binding, this cannot be considered as creating a sphere wherein the architect could make radical changes in the specifications already precise and certain, to the substantial disadvantage of the owner of the building.

"'The mere fact that a person is employed as an architect does not constitute such person a general agent of his employer, his powers being limited by the contract entered into between them. Thus, unless specially authorized, he is not entitled to change, alter, or modify the contract entered into by the builder and his employer; nor has he any authority to bind the owner by contracts for any work done upon or materials furnished for the structures concerning which he is employed; nor is he entitled to receive notice of an assignment of payments accruing on the contract, so as to charge the owner with notice thereof.'"

Review of the Building Situation

BUILDING in 1922 is certainly going to set a very high record according to figures just published by F. W. Dodge & Co., showing contracts awarded in February, 1922; also building projects contemplated for the same period.

According to these figures, as given below, February construction was 73 per cent. greater in volume than it was in the corresponding month of last year! The total amount of contracts awarded (not contemplated) amounted to a total of $177,472,900, which is an increase of 7 per cent. over the total for January, and this is the second largest total recorded in our statistics.

Perhaps the most significant feature of these figures is the large increase in the amount being spent for business buildings over that recorded in January, being 65 per cent. greater than the contracts awarded for business buildings in January. It is certainly a healthy sign of returning confidence in business. The amount to be spent for business buildings figures to 22 per cent. of the month's total contracts awarded, which is an unusually high percentage for this class of building.

Residential building is still in the lead, since $75,727,500,000 of the total amount is for home construction awarded during the month, this is 43 per cent. of the total. The contracts for this sum were for 5,846 separate buildings for residential purposes, bringing the average cost to $12,750. These figures, of course, would also include two or more family dwellings.

The greatest activity is disclosed in the figures for the New York District. There being a considerable increase over the January statistics. The figure of $59,328,500 is the largest February total recorded for this district. It is 9 per cent. over that for January and is 250 per cent. greater than the figure for February, 1921. This vast sum of $38,374,000, amounting to 65 per cent. of the total, is for residential construction alone!

In the Northeastern states the total amount for residential construction awarded in February amounted to $55,094,100 or 72 per cent. of the entire total for residential construction. This vast sum is but an indication of the immense amount of business that will be handled by builders in the Eastern states for home construction this year. Conditions today are more favorable for the economical construction of building than they have been for many years. Of course, conditions will never be exactly right in the building industry or in any other industry for that matter. But today we find an abundance of labor and an adequate supply of material at a comparatively reasonable price. The money market is also more favorable for financing building operation.

Here's the second advertisement in the big Beaver Board Campaign—Saturday Evening Post April 1st. It's an action getter for live contractors and carpenters. Are you all set? If not get busy. Write our nearest office for details of our plan for securing the business.

Those repairs won't be expensive

Beaver Board transforms a dingy interior into a beautiful, livable room.

Beaver Board makes it easy to put a comfortable room or two in the attic.

Substantial, business-like offices are quickly walled in with Beaver Board.

Half-finished garages are made complete by nailing Beaver Board to the beams.

NOT if you use genuine Beaver Board. The cost of Beaver Boarding is surprisingly low, yet the results are as permanent as they are good looking.

You can nail the big panels over old plaster or directly to joists and studding as easily as you would in finishing up new interiors. Either way you can count on a job that's eminently satisfactory. For Beaver Board walls and ceilings can't crack or fall.

Genuine Beaver Board is knotless, flawless manufactured lumber, made from the long, tough fibers of white spruce logs. Each panel is sized by our *patented Sealtite process*, which makes a perfect painting surface.

Nail up the panels, paint, if you care to decorate, add the finishing wood strips and the job is complete. It's quick, clean work, with little sawing and practically no waste. There's none of the muss or litter that goes along with ordinary repair work.

So, don't postpone needed repairs or remodeling work because you fear the trouble or expense. Your local carpenter or lumber dealer will gladly estimate the cost of the Beaver Boarding you want to do. See about it today.

Or, send our Builders' Service Department in Buffalo a rough sketch, giving dimensions, locating doors and windows and specifying the type of room, and our expert designers will prepare finished plans at no cost or obligation to you.

THE BEAVER BOARD COMPANIES

Administration Offices, Buffalo, N. Y.; Thorold, Ont., Canada; London, Eng.
District Sales Offices at New York, Atlanta, Buffalo, Chicago and Kansas City.

Above all, be sure you use genuine Beaver Board. Look for the Beaver Quality trade-mark on the back of each panel. It is there for your protection. Insist upon seeing it.

Trend of Material Prices

THE following are wholesale prices of basic building materials in the three markets which set prices for the rest of the country.

These prices are presented to show the trend of the wholesale market, which forecasts prices in the retail market. They are not prices which the average contractor can buy at, but are quoted to show him the movement of materials so that he can buy to better advantage.

Followed in conjunction with the Review of Building Conditions, these prices will prove invaluable.

All prices are for carload lots, F. O. B. market quoted, unless otherwise noted.

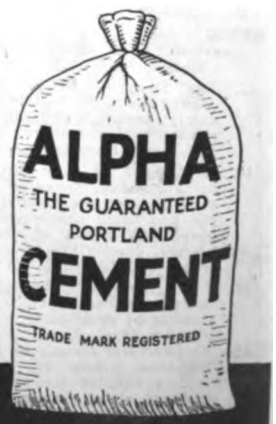
Get Some Suggestions

on building warehouses and storage houses of enduring cement construction—fireproof, paint-saving, substantial and attractive.

The ALPHA CEMENT dealer will give you a helpful Handbook—"ALPHA CEMENT—How to Use It"—and a special Service Sheet on small buildings. Most of the 104 illustrated pages of the Handbook deal with instructive suggestions on scores of permanent improvements for town, suburbs and country. A few pages tell how thirty-one years of experience in cement-making enable us to furnish you a product of the highest uniform quality.



If you don't know who the nearest ALPHA dealer is, write us, mentioning *Building Age.*

Selected List of Manufacturers' Literature

FOR THE SERVICE OF BUILDERS, CONTRACTORS, ARCHITECTS AND ENGINEERS

The publications listed in these columns are the most important of those issued by leading manufacturers identified with the building industry. They may be had without charge, unless otherwise noted, by applying on your business stationery to Building Age and The Builders' Journal, 920 Broadway, New York, or the manufacturer direct, in which case kindly mention this publication. Either the titles or the numbers may be used in ordering.

Listings in this Department are available to any manufacturer at the rate of $5 per listing per month.

ASBESTOS PRODUCTS

Asbestos Shingle, Slate & Sheathing Co., Ambler, Pa.

1. *Ambler Asbestos Shingles.* Catalog. 5½ x 8½ in. 40 pp. Illustrated.
2. *Ambler Asbestos Corrugated Roofing and Siding.* Catalog, 8½ x 11 in. 36 pp. Illustrated. Standard Purlin Spacing Tables.
3. *Ambler Asbestos Corrugated Roofing and Siding.* Catalog, 8½ x 11 in. 20 pp. Illustrated. Prices and specifications.
4. *Ambler Asbestos Building Lumber.* Cataleg, 8½ x 11 in. 32 pp. Illustrated.
5. *Engineers' Data Sheets.* Catalog, 8½ x 11 in. 40 pp. Illustrated. Specifications and working sheets for Ambler Asbestos Corrugated Roofing and Siding.

OAK FLOORS

(For Everlasting Economy)

Cincinnati Engineering Tool Co., Cincinnati, Ohio. 13-16 in. x 2¼ in. No. 2 Common Oak Flooring.

Tests the Factory Floor Must Meet

What will the first cost be?

The No. 2 Common Oak Flooring used in the above work room, formerly known as "Factory Oak Flooring," is the cheapest hardwood obtainable, being about 50% under any other hardwood flooring.

How long will it last?

To take just one example, we have on file a letter about an Oak Floor which has stood over 50 years of service in a *foundry* making gas engines.

Does it provide a smooth, hard trucking surface?

A tightly fitted, blind-nailed Oak Floor in this grade presents the ideal trucking surface.

Will it be cheap and easy to clean?

The facility with which an Oak Floor is cleaned is a big item in large buildings. Good oil finishes preserve the floor and prevent dust from rising.

What difference does it make to the employees?

The health and well-being of workers are now treated as matters of efficiency as well as humanity. Concrete or stone floors are cold, hard, "dead" and tiring on the workers. You often see a workman standing on a plank before a machine in a stone-floored factory.

In showing factory owners the advantages and economies of Oak Floors, builders render a high service and one doubly appreciated later on.

Our three free booklets, in colors, contain much valuable and accurate information for your data files. Write for them today.

National Steel Joists in place in Cynwyd Public School, near Philadelphia

Build School Floors Firesafe With Steel Joists

You have, no doubt, built many buildings with National Steel Joist firesafe floors, including stores, garages, homes, office buildings, theatres, apartments, hospitals, etc. How about schools? How many times have you secured the advantage which this modern type of economical firesafe floor construction affords your bids on school structures?

Prominent architects and contractors nearly everywhere now consider National Steel Joist firesafe floors and roofs the standard construction for school buildings. The cost is low—lower than that of any other type of recognized firesafe designs. And remember, the dead weight of these floors averages only 40 pounds to the square foot. That means half the weight in materials to buy, handle, erect and on which transportation must be paid.

National Steel Joist firesafe floors can be quickly erected. There is no time and money lost in building and tearing down wood forms, as in concrete construction. The work of all trades on the job is perfectly synchronized. And the sound-proof qualities of National Steel Joist floors is also of great importance in school construction.

There are stocks of National Steel Joists not far away—more than likely in your city. The joists are delivered to the job cut to meet the plans. And it's surprising how easily Steel Joist floors are embodied in plans. If you have yet your first Steel Joist job to plan or erect, you had better let us send you full information now. You'll be asked about this modern type of economical firesafe floor construction soon.

FLEX-A-TILE
HOUSE TOPS

Modern Re-Roofing

IT'S the modern way to lay Flex-a-Tiles right over the old roof and get a better appearing, longer lasting roof than before. Scraping off the old shingles takes time and is an unnecessary expense. No need to litter up the yard and fill the house with dust and dirt. Just lay Flex-a-Tiles over the old roof.

Look at the buildings around you that need Flex-a-Tile Housetops. See the homes, stores, mills, warehouses, farm-houses and public buildings that need new roofs in your own community.

Tell Them About Flex-a-Tile Housetops

Show them the permanent slate roof appearance attainable with Flex-a-Tiles, either fadeless natural green or a beautiful enduring red. Tell them how Flex-a-Tiles last—how they protect buildings from fire and all weathers and above all how economical it is to lay them over the old roof.

FLEX-A-TILE Slate Surface Housetops

Offers a Complete Line for Dealers:

Flex-a-Tile Individual Shingles
Flex-a-Tile Wide Space Shingles
Flex-a-Tile Giant Shingles
Flex-a-Tile Style Four Slabs
Flex-a-Tile Shingle Roll Roofing
and Richardson Wall Board

Truscon Laboratories, The, Cor. Caniff Avenue and Grand Trunk R. R., Detroit, Mich.

131. *Spread the Sunshine Inside.* Booklet. 5 x 8 in. 24 pp. Describes methods for light saving by the application of light reflecting enamels to interior walls of factories.

PARTITION STEEL

Empire Steel Partition Co., College Point, Long Island, N. Y.

PARTITION SYSTEM

United States Gypsum Company, 205 W. Monroe St., Chicago, Ill.

133. *Loose leaf bulletins,* 8½ x 11 in. Jester-Sackett, consists of plaster board applied to metal channels, with special clip, ready for plastering.

PARTITION TILE

United States Gypsum Company, 205 W. Monroe St., Chicago, Ill.

134. *Fireproof.* 32-page booklet, 8½ x 11 in., including description, specifications, and working details of Pyrobar partition tile.

PLASTER—(Interior)

United States Gypsum Company, 205 W. Monroe St., Chicago, Ill.

PLASTER BOARD

United States Gypsum Company, 205 W. Monroe St., Chicago, Ill.

135. *Pamphlets,* describes Sackett Plaster Board used instead of wood or metal lath.

PERGOLAS

Hartmann-Sanders Co., Elston and Webster Avenues, Chicago, Ill.

235. *Album No.* 33. 7½x10½ in. 42 pages of illustrated literature regarding the various types of Pergolas.

PLUMBING SUPPLIES

Hardin-Lavin Co., 4538 Cottage Grove Avenue, Chicago, Ill.
Hess Warming & Ventilating Co., 1205D Tacoma Building, Chicago, Ill.

136. *Hess Sanitary Steel Medicine Cabinets.* Booklet. 4 x 6 in. 16 pp. Illustrated.

B. Karal & Sons Co., 806 So. Kedzie Ave., Chicago, Ill.

PUMPS

C. H. & E. Mfg. Co., Milwaukee, Wis.

251. Bulletin No. 2. Pumps.

The F. E. Myers & Bro. Co., Ashland, Ohio.

137. *General Catalog.* 6 x 9 in. 392 pages. Shows complete line of Myers Products—Pumps for Every Purpose, Hay Tools, Door Hangers, Store Ladders, etc. Of particular interest to hardware and implement dealers; plumbers, architects, contractors and builders; mill, mine, factory and railway superintendents and purchasing agents; highway contractors and builders.

138. *Catalogs.* 6 x 9 in. Devoted to separate lines: No. 55, Pump—Hand and Power Pumps; No. PP-55, Power Pumps; No. HT-55, Hay Tools, Door Hangers and Store Ladders; No. HP-22, Hydro-Pneumatic Pumps, Electric House Pumps, Direct Water Systems; No. SOP-21, Self-Oiling Power Pumps; No. MC-21, Cylinders and Working Barrels; No. SP-22, Spray Pumps and Spraying Accessories. All catalogs fully illustrated.

REFRIGERATION

McCray Refrigerator Co., 2264 Lake Street, Kendallville, Ind.

ROOF DECKS

United States Gypsum Company, 205 W. Monroe St., Chicago, Ill.

139. *Loose leaf bulletins.* 8½ x 11. Describing Pyrobar Roof Tile, which is laid directly on purlins or tee irons, joints grouted, and is then ready for roof covering.

ROOFING MATERIALS

Amalgamated Roofing Co., 431 So. Dearborn Street, Chicago, Ill.
American Sheet & Tin Plate Company, Pittsburgh, Pa.

140. *"Better Buildings."* Catalog. 8½ x 11. 32 pp. Describing Corrugated and Formed Sheet Steel Roofing and Siding Products—Black, Painted and Galvanized; together with directions for application of various patterns of Sheet Steel Roofing in various types of construction.

112. *Copper—Its Effect Upon Steel for Roofing Tin.* Catalog 8½ x 11 in. 28 pp. Illustrated. Describes the merits of high grade roofing tin plates and the advantages of the copper-steel alloy.

Asbestos Shingle, Slate & Sheathing Co., Ambler, Pa.

141. *Specifications and Price List.* Descriptive booklet. Details of Ambler Asbestos Cement Roofing Slates, "Century" Asbestos Shingles and Asbestos Corrugated Sheathings. Tables and drawings. Size 6 x 9 in. 44 pp.

142. *Ambler Asbestos Corrugated Roofing.* Catalog gives complete data for specifying, drawings, methods of application, tables, etc. Size 8½ x 11 in. 20 pp.

Wm. L. Barrell Co., of N. Y., Inc., 50 Leonard Street, New York.

143. *Prepared Canvas for Roofing.* Samples can be obtained on application. A canvas for every use.

John Boyle & Co., Inc., 112-114 Duane Street, New York, N. Y.

145. *Boyle's Bayonne Roof and Deck Cloth.* List B 93. A prepared roofing canvas guaranteed waterproof for decks and the roofs and floors of piazzas, sun-parlors, sleeping porches, etc.

Copper & Brass Research Association, 25 Broadway, New York City.

Cortright Metal Roofing Co., Philadelphia, Pa.

236. Four-page circular describing the various shingles.

Creo-Dipt Company, 1025 Oliver Street, North Tonawanda, N. Y.

153. *Standard Stained Shingle.* Samples of different kinds mailed on request.

Why Many Modern Homes Are Kernerator-Equipped

Many successful contractors now include the Kernerator in the houses they build because it has proved itself an effective sales factor that appeals to prospects and continues to satisfy owners long after they have purchased a home. For comfort, convenience and sanitation this modern system for disposing of household waste is without an equal. It entirely eliminates the unsightly garbage can.

The Kernerator consists of a brick incinerator, built into the base of the chimney when the house is erected and a hopper door located in the flue on the first floor. It takes care of all refuse—rags, sweepings, wilted flowers, broken crockery, tin cans, garbage. Non-combustibles are sterilized and dropped into the ash-pit for removal. The Kernerator costs nothing to operate for no commercial fuel is required.

Write for our interesting literature giving complete information regarding the Kernerator. Also see page 1906, Sweet's 1921 Catalog.

Roof stained with Cabot's Creosote Stains. Walls finished with Old Virginia White. Lined with Cabot's Quilt for warmth
Prentice Sanger, Architect, New York

For Roofs, Siding, Timbers and all Other Outside Woodwork

Cabot's Creosote Stains

They have *proved* their merit in every climate for nearly forty years. The colors are soft, rich and harmonious, the Creosote penetrates the wood, preserves it, and makes it less inflammable. Shingles make the warmest and cheapest outside finish, and a shingled house stained with Cabot's Stains is the ideal, cozy American country home.

Cabot's Insulating Quilt

A scientific heat insulator and sound-deadener that makes houses warmer in winter and cooler in summer and deadens sounds in floors and partitions. Not a mere felt or paper, but a non-conducting mat that is about thirty times warmer than common papers.

You can get Cabot's Stains and Quilt all over the country. Send for samples and names of nearest agents.

SELECTED LIST OF MANUFACTURERS' LITERATURE—*Continued from page 84*

TOOLS

C. E. Jennings & Co., 321 Winthrop Avenue, New Haven, Conn.
Mack & Co., Rochester, N. Y.
Progressive Mfg. Co., Torrington, Conn.
Sargent & Co., New Haven, Conn.
Stanley Works, New Britain, Conn.
James Swan & Co., Seymour, Conn.
The L. & I. J. White Co., Buffalo, N. Y.

TRACTORS

C. H. & E. Mfg. Co., Milwaukee, Wis.
253. Bulletin No. 4, Tractors.

TRAILERS

Rogers Bros. Co., Albion, Pa.

TRUSS LOOPS

The Bostwick Steel Lath Co., Niles, Ohio.
235. *"Beautiful Permanent Walls,"* 22-page illustrated catalog. 4x9 inches.

VENTILATION

Automatic Ventilator Co., 1003 Park Avenue, Baltimore, Md.
192. *Illustrated Folder.* Describes the construction and installation of an automatic ventilator which can be installed at the top or bottom of a window, either inside or outside.

Royal Ventilator Company, 415 Locust Street, Philadelphia, Pa.
193. *Descriptive Catalog* of round and rectangular ventilators made in galvanized iron, copper, etc. Illustrated.

The Stark Sheet Metal Works Co., Rex and Second Streets, S. E., Canton, Ohio.

E. G. Washburne Co., 207 Fulton Street, New York, N. Y.
194. *Illustrated Booklet* of metal ventilators, weather vanes, lightning rods, etc.

WALL BOARDS

Asbestos Shingle, Slate & Sheathing Co., Ambler, Pa.
195. *Descriptive catalog and sample of Linabestos Wall Board* for interior construction. Flame-proof and fire-resisting wall board.

Beaver Board Co., Buffalo, N. Y.
196. *Illustrated folder*, describing various uses and the methods of handling Beaver Board to the best advantage. Samples with descriptive literature sent on application.

Bishopric Mfg. Co., Cincinnati, Ohio.
198. *Booklet. "Bishopric for All Time and Clime."* Containing facts and figures, and illustrated with photographs of beautiful houses built with Bishopric stucco, plaster and sheathing units. Sent free.

Compo-Board Co., 5778 Lyndale Avenue, North, Minneapolis, Minn.
199. *Catalog sent on request with sample.* Describes many uses of Compo-Board.

McAndrews & Forbes, 200 Fifth Avenue, New York, N. Y.
200. *Folder.* Describing uses and application of Fiberlic Wall Board, together with sample of same sent to any address.

United States Gypsum Company, 205 West Monroe Street, Chicago, Ill.
201. *Walls of Worth.* Booklet. 8½ x 11 n. 24 pp. Illustrated. Describes Sheetrock, the fireproof wall board, its advantages and uses.

WALL FURRING

United States Gypsum Company, 205 West Monroe Street, Chicago, Ill.
202. *Thirty-two-page Booklet.* 8½ x 11 in. Pyrobar. Tile.

WATER HEATER

Hardin-Lavin Co., 4538 Cottage Grove Avenue, Chicago, Ill.

WATERPROOFING—See also Dampproofing

Truscon Laboratories, The, Corner Caniff Avenue and Grand Trunk R. R., Detroit, Mich.
206. *Science and Practice of Integral Waterproofing.* Pocket size. 33 pp. Illustrated. Contains full specifications for waterproofing MASS Concrete, stucco and Cement Plaster Coat. Entire chapter devoted to "Practical Application of Waterproofed Cement Plaster Coat."
207. *Technical Pamphlet No. 8.* Booklet. 4 x 7 in. 28 pp. A discussion of why concrete requires waterproofing and the properties an integral waterproofing must possess to operate effectively with the natural properties of concrete.

WATER SUPPLY SYSTEM

Hardin-Lavin Co., 4538 Cottage Grove Avenue, Chicago, Ill.

WEATHER STRIPS

Allmetal Weatherstrip Co., 126 West Kinzie Street, Chicago, Ill.
239. Six-page illustrated circular, describing the product as used for Hotels, Residences and Institutions.

Diamond Metal Weatherstrip Co., Columbus, Ohio.
242. 34-page illustrated catalog. 8½ x 11¼ in. Containing blue prints of the various styles and sizes of Weatherstrip.

Monarch Metal Products Co., 5020-26 Penrose Street, St. Louis, Mo.
210. *Cause and Effect.* A series of pamphlets describing Monarch Metal Weather Strips, which are made of bronze, brass and zinc. They differ from all other strips in that they are applied in spaces around doors and windows as elastic fillers and not over the space as covers. Each 4 pp. 8½ x 11 in.

Victor Parting Bead Co., Reading, Pa.
209. *Through the Closed Window.* 12 pp. Treats of Victor Parting Bead as a modern stripping device. *How to Weather Strip Doors and Windows the Victor Way.* 32 pp. Complete instructions on how to install parting beads, and metal weather stripping.

WEATHER VANES

E. G. Washburne & Co., 207 Fulton Street, New York, N. Y.
211. *Descriptive Catalog in Colors.* Showing two different designs of weather vanes, lightning rods, ventilators, etc

WINDOWS—See Also Doors and Windows

The Bogert & Carlough Company, 30 Peach Street, Paterson, N. J.
254. BOCA steel sash. (E-22.) A catalogue containing designing information, complete details and tables, and illustrations of standard installations of sidewall sash, monitor sash, mechanical operators, steel doors, and steel partitions. 24 pages. Illustrated. 8½ x 11 in.

Hope & Sons, Henry, 103 Park Avenue, New York.
212. *Catalog.* 12¾ x 18½ in. 30 pp. Illustrated. Full size details of outward and inward opening casements.

WINDOW CASEMENTS

The Bogert & Carlough Company, 30 Peach Street, Paterson, N. J.
254. BOCA steel sash. (E-22.) A catalogue containing designing information, complete details and tables, and illustrations of standard installations of sidewall sash, monitor sash, mechanical operators, steel doors, and steel partitions. 24 pages. Illustrated. 8½ x 11 in.

WINDOW HARDWARE

The Kawneer Company, Niles, Mich.
213. *Kawneer Simplex Windows.* Catalog. 8½ x 10½ in. 16 pp. Illustrated. Complete information, with measured details, of Kawneer Simplex Weightless Reversible Window Fixtures, made of solid bronze. Shows installations in residences and buildings of all sorts.
214. *Detail Sheets and Installation Instructions.* Valuable for architects and builders.

Monarch Metal Products Co., 5020 Penrose Street, St. Louis, Mo.
232. 16-page illustrated catalog, 4 x 9 in., on Window Casements.

National Mfg. Co., Sterling, Ill.

Pullman Mfg. Co., Rochester, N. Y.

Samson Cordage Works, Boston, Mass.
Catalog. 3½ x 6¼ in. 24 pp. Illustrated. Covers complete line.

Sargent & Co., New Haven, Conn.

Smith & Egge Mfg. Co., The, Bridgeport, Conn.
215. *Booklet.* 6¼ x 9 in. 42 pp. Illustrated. Covers a complete line of chains, hardware and specialties.

Stanley Works, New Britain, Conn.

WIRE ROPE

Williamsport Wire Rope Co., 122 South Michigan Avenue, Chicago, Ill.

WOODWORKING MACHINERY

American Saw Mill Machinery Co., Hackettstown, N. J.
217. *Contractors' Bulletin No. 77.* Describing various types of portable Variety Woodworkers. General catalog No. 22, describing a general line of woodworking machinery.

W. F. & John Barnes Co., 71 Rudy Street, Rockford, Ill.
218. *Catalog.* Containing description of rip and other machine saws, formers, mortises, tenoners, lathes. 38 pp. Illustrated.

C. H. & E. Mfg. Co., 259 Mineral Street, Milwaukee, Wis.
219. *Catalog* of portable saw rigs, pumps, compressors, engines, etc. 48 pp. Illustrated.

The Crescent Machine Co., 259 Main Street, Leetonia, Ohio.
220. *Catalog.* Describing band saws, shapers, jointers, planers, borers, mortises, etc. 144 pp. Pocket size. Illustrated.

Hutchinson Mfg. Co., Lafayette Street, Norristown, Pa.
221. *Illustrated descriptive circular* of portable woodworking machinery that you can take to the job, using it on a bench.

R. E. Kidder Co., 35 Hermon Street, Worcester, Mass.
222. Catalog. Describing improved boring machine and how it can be used.

Parks' Ball Bearing Machine Co., Sta. "A," Cincinnati, Ohio.
223. *Illustrated Folder.* Describing Parks' Planing Mill Special, comprising circular saw, jointer, band saw, shaper, borer, tenoner, etc.

J. D. Wallace & Co., 1401 Jackson Boulevard, Chicago, Ill.
225. *Bulletin No. 219-K.* Describes portable electric punch machines, tools, planers, jointers, circular saw, etc.

Perfection
INDOOR
CLOSETS
WITHOUT WATER
OR SEWER

The modern, safe, sanitary closet for every farm home, village home, summer camp or any unsewered building. Easy to set up—least care—small cost. Makes better homes and better health. Builders ask for particulars—some sales agencies.

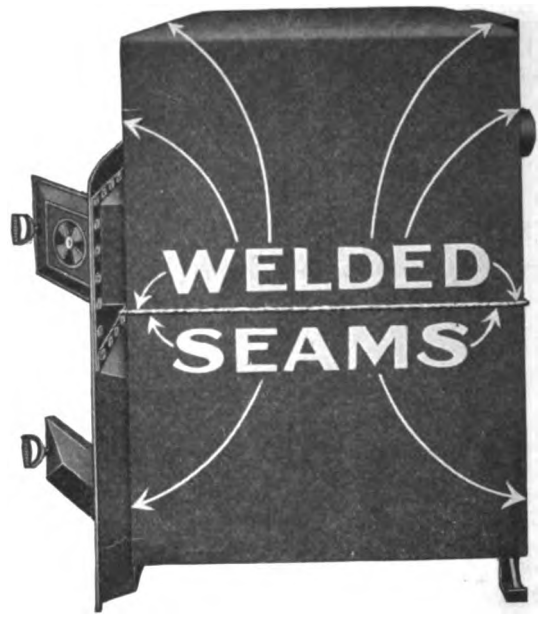
WHAT'S YOUR CHOICE?

Would You Buy a Cracked Furnace?

HERE'S ONE

Rough castings—piled one on the other. No fitting, but the cracks filled with cement or sand. They warp and twist—expand and contract with heat, distributing gas and dust all over the house. Limited radiating surfaces, unevenly heated; wasteful of fuel; expensive to repair.

THE ORDINARY FURNACE



Not from any particular maker, but a **type** produced, with slight modifications, by many foundries. Just the common, ordinary, cast iron furnace, which established the reputation that furnaces are dusty and dirty, and **"lives up to it."**

The Hess Furnace Is DIFFERENT

A solid steel box—with every seam riveted and welded; sealed with melted steel. As tight as a bottle. Firebox, ashpit and grates inside. **Seams guaranteed never to leak as long as the furnace lasts.**

COSTS MORE (but not much more) **WORTH MORE**

Burns Anything. Delivers All the Heat

THE HESS WELDED STEEL FURNACE

Immense radiating surface, evenly heated, but never over-heated, the firebox being lined with heavy fire brick.

Six sizes—**Pipe** and **Pipeless.** Ask for our illustrated booklet telling how we heat houses successfully, assuming full responsibility for success, no matter where you live.

Dull Season Prices, the year's lowest, are in effect now

Contractors everywhere are taking advantage of our special free plan service, and our factory-to-contractor prices. They mean larger business and satisfied customers.

US
SHEETROCK

Because it gives lasting satisfaction one Sheetrock job leads to another

Wherever you use Sheetrock you are sure of a job that will be a constant endorsement of your ability as a builder.

For Sheetrock, being made of gypsum rock, will not warp or pull away from the supports. It is fireproof. The lasting satisfaction Sheetrock walls and ceilings give will naturally prompt the owner to think of you when other jobs come up.

Sheetrock Saves Time

Sheetrock saws and nails like lumber. The broad, ceiling-high sheets are easily and quickly nailed to joists and studs.

Sheetrock saves waiting for plaster to dry; it is immediately ready for the decorators.

Sheetrock Keeps Rooms Comfortable

Sheetrock walls and ceilings are tight-jointed and uniformly smooth. They take any decoration the owner wants—paper, paint or panels. The low conductivity of Sheetrock helps keep rooms warm in winter and cool in summer.

Your Customers Know Sheetrock

Sheetrock is backed by the strongest advertising campaign ever put behind a wallboard. Your customers know and have confidence in Sheetrock.

We have a plan that is helping hundreds of carpenters and contractors get Sheetrock jobs and make more money. Let us tell you about it. Just fill in and mail the coupon.

Sheetrock is inspected and approved by The Underwriters' Laboratories, Inc.

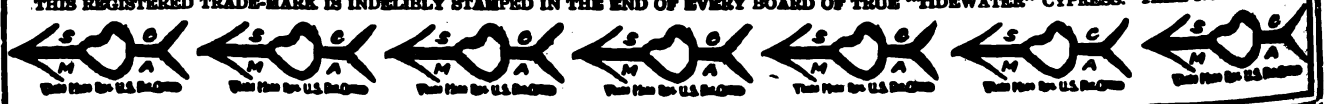
THIS REGISTERED TRADE-MARK IS INDELIBLY STAMPED IN THE END OF EVERY BOARD OF TRUE "TIDEWATER" CYPRESS. LOOK FOR IT.

CYPRESS "The Wood Eternal"

is undoubtedly the best material from which to make stable or garage floors, or for planking in the cellar, or sills for the barn. This is because moisture has practically no effect on this remarkably enduring wood. Heart Cypress is almost "ROT-PROOF" and it is universally conceded that CYPRESS shrinks and swells ("comes and goes") as little as any wood that ever grew. Paint it or not—as you wish. It lasts and lasts and lasts—anyhow.

THE BEST WOOD FOR YOUR CUSTOMER TO USE
IS THE BEST WOOD FOR YOU TO RECOMMEND



Let our "BUILDERS' HELPS DEPARTMENT" help YOU. Our entire resources are at your service with Reliable Counsel. We invite correspondence with a serious purpose in it.

Southern Cypress Manufacturers' Association

They Laid Winthrops right over old shingles

Winthrop Tapered Asphalt Shingles Partially Laid Over the Old Wood

The Completed Job. It gives the Effect of a High Grade Slate Roof.

★ ★ It gives us pleasure to tell you Winthrop Tapered Ashphalt Shingles are A-1. We would purchase the same material tomorrow, if occasion demanded it. ★ ★
Cordially yours,
(Signed) John J. Hunt.
SS. Peter and Paul Cathedral, Detroit.

When SS. Peter and Paul Cathedral, Detroit, Michigan, needed to be re-roofed, many kinds of roofing material were investigated. Winthrop Tapered Asphalt Shingles were selected because they meet every requirement for economy, permanency, beauty, and storm and fire resistance.

The Winthrops were laid right over the old wood shingles and they lie as flat and smooth as a high grade slate roof. By laying them over the old shingles the cost of removing the old wood was avoided. Added insulation against heat and cold was gained and there was no destruction of shrubs and lawns because the old shingles were not dropped off the roof to lie until the job was completed.

Actual service has proven the long lasting qualities of Winthrops. Roofs laid 14 years ago appear today to be serviceable for years to come and the owners of those roofs have never had to spend a cent for roof repairs.

The big butt of Winthrop Shingles gives a surplus of material where it is needed to combat the elements and to protect against fire. The taper gives the artistic "shadow line" that makes the roof beautiful and adds distinction to the building.

Winthrops are the only asphalt shingles that are tapered—they have all the desirable features of any asphalt shingles—plus the taper.

There is still valuable territory open for dealers—write for full information on these superior shingles and our attractive dealer proposition. Address the nearest factory.

Try Them Out on *One* Roof and the Rest Will Follow

It takes but a single roof in any one community to start an avalanche of owners asking for a roof of

ILLINOIS

ZINC SHINGLES

"The Roof that's Always New"

We can tell you, and you can tell prospective customers, that a roof of Illinois Zinc Shingles surpasses a roof of any other material. But nothing will PROVE it to them quite so well as a roof which they can SEE.

It doesn't matter whether you cover an old wooden roof or build an entirely new roof with these pure zinc, everlasting shingles. Either one will show the contrast in beauty, cost, weight, protection, durability and upkeep with any other type of roof which they could build.

Low bidding is not the only factor which secures a contract. Offer better roofs and see how that will help. A sample roof, which you can point to, helps you even more. We'll do everything possible to assist you with this sample roof. Write for details of our "First Roof" Plan.

Keen Interest Shown in Ideal Wall

Architects and builders everywhere are showing keen interest in Ideal wall construction, described in this publication, "Brick, How to Build and Estimate." They realize the Ideal wall, by cutting the cost of wall construction 33⅓ per cent, places brick construction within reach of every home seeker. All they have to do is to set the facts before those who need homes, and it is no trouble at all to convince the prospective home owners that they should select brick construction.

How Builders Regard "Brick, How to Build and Estimate"

Two typical letters from hundreds we receive.

"I am in receipt of your valuable book, "Brick, How to Build and Estimate". I have not had time to study this book as I intend doing, but from looking thru it I find that you have presented some very valuable information in exceedingly usable form. This is the best building manual I have had the pleasure to receive in some time. Thanking you for the courtesy shown me, I am

Yours truly,

(*Signed*) H. M. Douglas"

"Having looked through your book, "Brick, How to Build and Estimate" I find it the most complete manual that a bricklayer could secure.

And I sincerely believe it will be very helpful to me.

Yours very truly,

(*Signed*) W. A. Hopkins"

The information on Ideal wall and other brickwork makes "Brick, How to Build and Estimate" worth several times its nominal price of 25 cents. You can secure it from The Common Brick Industry of America, 1308 Schofield Building, Cleveland, Ohio.

The Ideal Wall is made of standard brick obtainable everywhere

A house at Phillipsburg, N. J., built of the Ideal wall. Paul R. Smith, architect

Architect Says Ideal Wall a Great Success

Architect Paul R. Smith of Phillipsburg, N. J., says that the Ideal wall is a great success. He believes that in a short time it will come into general use all over the country. (In less than a year it has been adopted in over 100 communities.)

It offers a wonderful opportunity for contractors to build brick homes at the cost of frame. Such homes are bound to have a ready market and yield a very satisfactory profit.

This Trade-Mark Stands for—

Quality—
An honest product, honestly advertised.

Responsibility—
A reputation for honorable, prompt and efficient business dealings.

Service—
A material of proven integrity with a record of ages of service.

TAYLOR'S TARGET AND ARROW ROOFING TIN PROTECTS MANY OF OUR NATION'S MOST TREASURED BUILDINGS

TIME TELLS

This trade-mark stamped on each sheet

THE PRODUCT — Time tells when Target and Arrow roofing tin is judged by the length of time it takes to make each sheet, for it takes 35 minutes to coat each sheet of Target and Arrow, whereas a sheet of ordinary roofing tin is coated in 20 seconds!

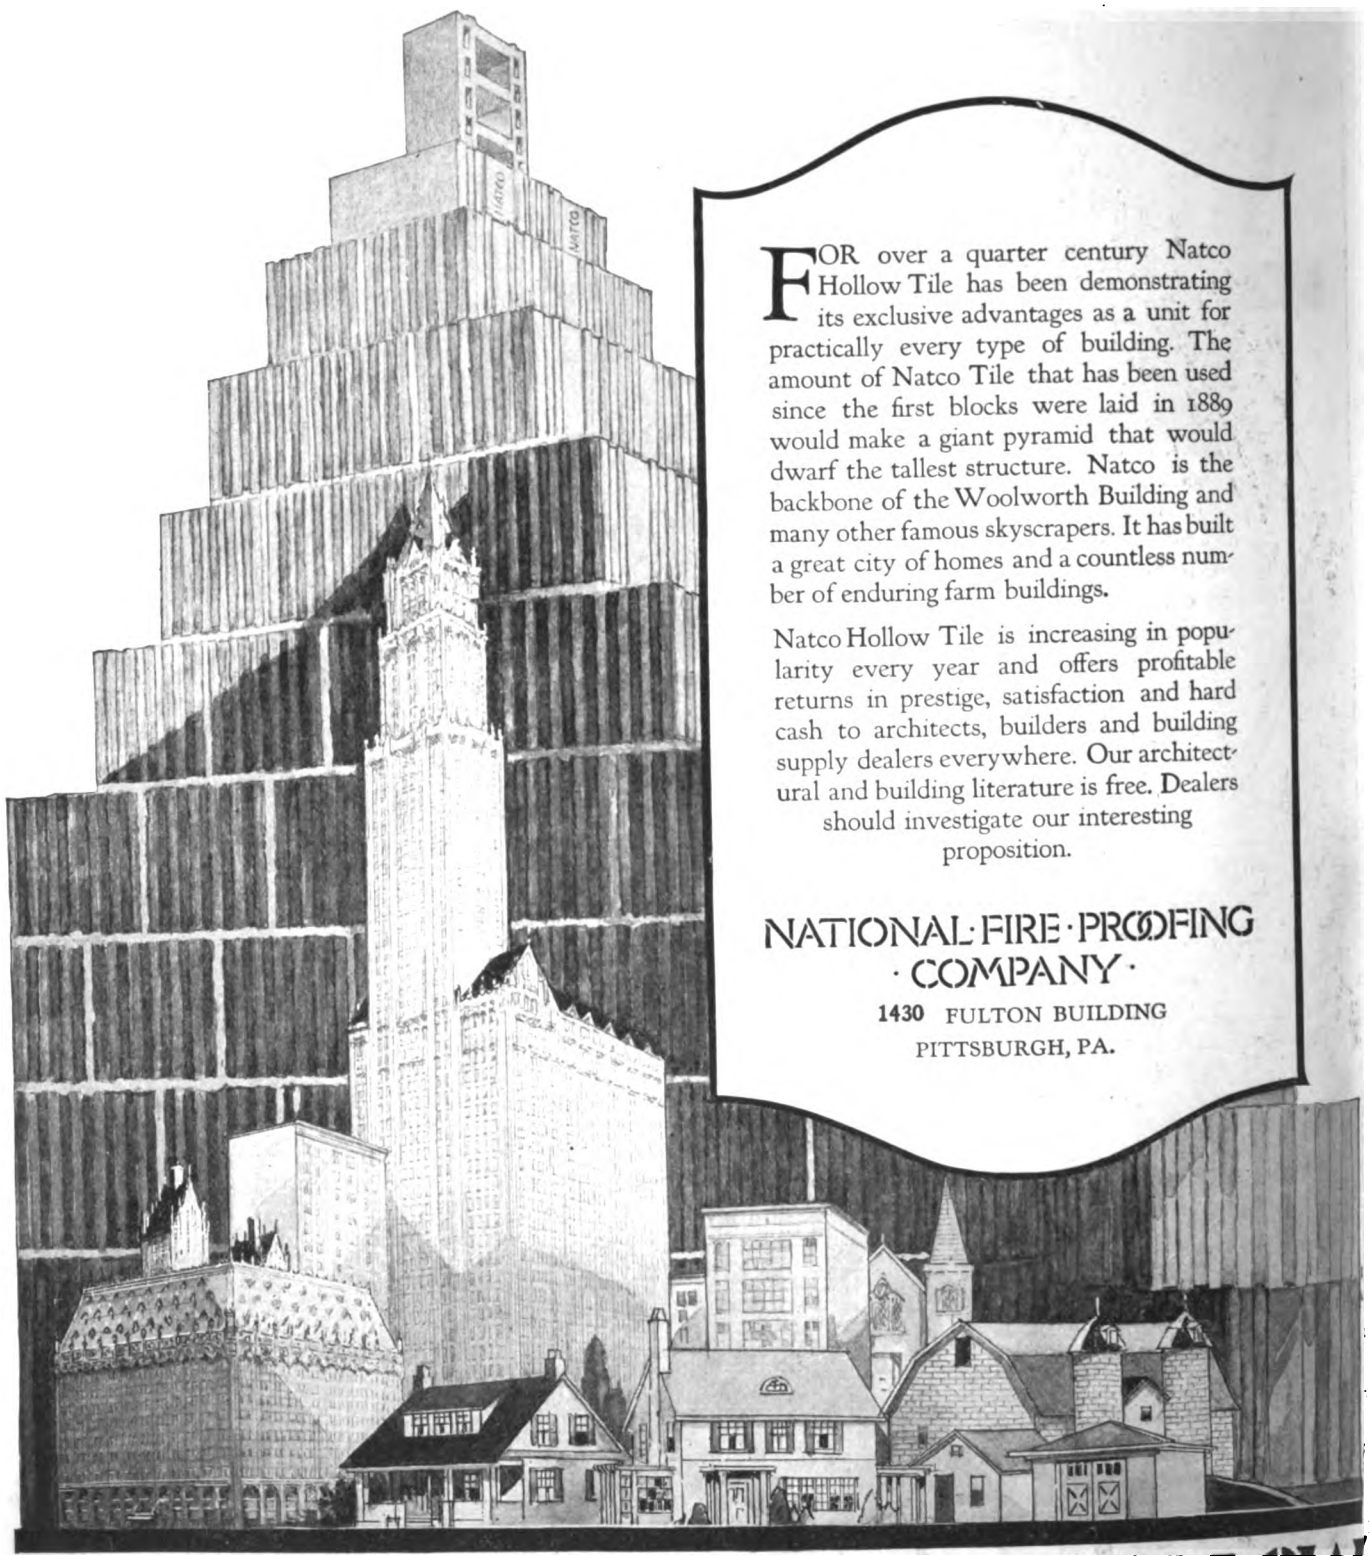
THE MANUFACTURERS — Time tells when Target and Arrow is judged by the length of time the manufacturers have been connected with the making of tin plate. The art of tinning metal plates was introduced into Wales by an ancestor of the founders of the firm of G. & W. Taylor, who, in 1810, started to import tin plate from Wales, where it was made especially to their order, but with the advent of the McKinley Tariff the Taylors began to manufacture tin plate in this country. Today their plant is completely equipped to manufacture roofing tin from pig iron to finished tin plate

THE MAKERS—Time tells when Target and Arrow is judged by the length of time the actual makers have plied their art. Men start to work in the Taylor mills when they are mere boys. Here they learn their trade from experts who originally gained their experience in the tin mills of Wales at a time when Welsh tin plate makers were the best in the world.

THE USERS—Time tells when Target and Arrow is judged by the length of time it lasts, for there are records of its having protected property for 50, 60 and even 70 years, and countless records of perfectly satisfactory service for 30 years and more with this material still on the building and fit to render service for many years to come.

Full information on request

Four generations of the Taylor family have directed and controlled the business since its establishment — a veritable business heritage, with a reputation for quality products which each succeeding generation has striven to uphold.



Three generations of Storers—all working in the Taylor plant—typical of the loyalty and steadfastness of Taylor employees.

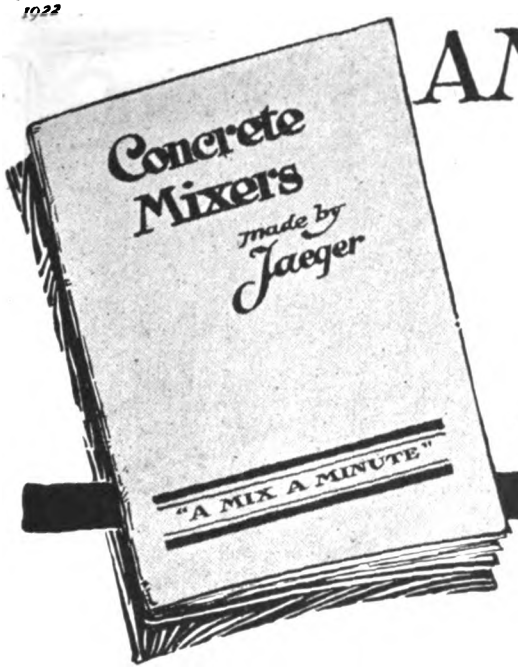
A Mountain of Proof



FOR over a quarter century Natco Hollow Tile has been demonstrating its exclusive advantages as a unit for practically every type of building. The amount of Natco Tile that has been used since the first blocks were laid in 1889 would make a giant pyramid that would dwarf the tallest structure. Natco is the backbone of the Woolworth Building and many other famous skyscrapers. It has built a great city of homes and a countless number of enduring farm buildings.

Natco Hollow Tile is increasing in popularity every year and offers profitable returns in prestige, satisfaction and hard cash to architects, builders and building supply dealers everywhere. Our architectural and building literature is free. Dealers should investigate our interesting proposition.

A New JAEGER Catalog

Showing the Most Complete Line of Mixers Made ~ At New Low Prices!

Jaeger
"A MIX A MINUTE"

The New Jaeger Catalog Is Off the Press

—and with the new book we announce *new low prices* on the complete Jaeger line. When you realize that Jaeger prices always have been extremely moderate, you will appreciate the unusual values presented at the new low prices.

There are four excellent reasons why the Jaeger line offers the most for the money in the mixer field:

The first cost is less.

The upkeep cost is less. Jaeger mixers are simple—sturdy—easy to operate.

They turn out as good concrete as any mixer made—*and do it in less time.*

The depreciation is from 20% to 30% lower than on any other line of mixers.

Our advertisements can only hit the high spots in the Jaeger story of mixer quality and low price. Our catalog gives you the facts complete. Whether you are thinking of buying a mixer just now or not, there's valuable information in this book for you—for every contractor, every builder, every user of concrete mixers.

Immediately on receipt of the coupon we will send you your copy of the Jaeger catalog. *Write today!*

Books That Will Increase Your Profits

Carpentry and Building Construction

Hick's New Builders' Guide

This standard book has just been revised and brought thoroughly up-to-date by the addition of much new material. It authoritatively covers masonry, hollow tile, estimating, roof framing, etc. Recommended by experienced men as the best modern text book for apprentices and journeymen. Full of practical "short cuts." A section of the book is devoted to tables which save considerable time that otherwise would be spent in lengthy figuring.

Contents by Chapters: Layout of Site. Excavating, Sheet Piling and Pumping. Shoring and Underpinning. Stone Masonry. Waterproofing Foundation Walls. Concrete Construction and Forms for Concrete Footings and Foundation Walls. Brickwork. Hollow Tile, Construction and Costs. How to Do Stucco Work on Metal Lath, Brick and Wood Lath. How to Lay Out and Build Fireplaces. Chimney Design and Construction. House Framing, Roof Framing. Mitering Planceers, Mouldings, etc. Carpentry and Construction Kinks. Metal Ceilings and Walls. Estimating Quantities of Materials. Estimating Labor on Carpentry. Estimating Brickwork. Short Cuts in Estimating Forms, etc. Miscellaneous Tables. 360 pages, 4½x7 inches, 300 figs. Flexible fabrikoid **$3.00**

Martin's Details of Building Construction

Intended as a reference manual on the best methods of frame construction. Over 300 separate detail drawings are shown; covering all the ordinary details of construction. In many cases alternative methods are shown. 10x12½ inches. Price.....**$2.50**

Estimating and Specification Writing

Emerson's Modern Building Superintendence and the Writing of Specifications

It covers details of the very newest building methods and modern materials, steel skeleton construction, steel beams, reinforced concrete, plumbing, electric lighting, vacuum cleaning, etc., etc. The author takes a fine modern business building of twenty stories high and, beginning with the excavation, covers every detail of construction until the building is completed. In the second part of the book he deals with the writing of specifications. A careful and accurate and clear writing of specifications involving a knowledge of materials and matters of construction is an essential in the equipment of every young architect. 247 pages, 4¼ inches. Cloth.

Price **$1.75**

Hick's Specification Blanks for Frame or Brick Buildings

It pays to have definite specifications covering all details of the work when preparing your estimates. These new blanks are arranged to cover all the work apt to be called for in erecting residences, churches, schools, and other small public buildings in various sections of the country. All the user has to do is insert his sizes, quantities, etc., and cross out what he does not want. Plenty of space is left at the end of each specification for extra data. 8 pages, 7x10 inches. Paper.....**15 cents each; 12 for $1.50**

ANNOUNCEMENT

While this is a new organization, over twenty years' experience in publishing and selling mechanical books is at your service. The management and stockholders include men who are nationally known as authorities in the building and allied trades.

4 cu. ft. capacity with light duty hoist, 80 ft. per minute rope speed, lifting capacity, single rope 500 pounds.

4 cu. ft. capacity. 6 cu. ft. unmixed materials. Discharges heavy concrete in 10 seconds. 3 H. P. engine.

How do we keep the price down?

Not by taking it out of the construction of the mixer! No! The Dandie sets a new standard for light mixers, both in speed of operation, and in long service life. Yet it sells within the price range for light mixers. Big volume production, standardization in every part, and labor saving machinery only possible with the largest mixer manufacturer, keeps down the price.

7 cu ft. capacity. 4 H. P. engine. 5 H. P. boiler.

KOEHRING DANDIE MIXER

A light, easily portable mixer for footings, culverts, foundations, etc. Mixes concrete or mortar. As splendidly engineered as the big Koehring Paving Mixers. Great strength without excess weight! Double drum gear drive. Universal joint bearings. The Koehring heavy duty drum roller construction! Discharge controlled from either side. Extra liberal simple power. Genuinely, a trouble-proof mixer that stands up to all you can give it. Write for catalog.

Dandie Capacities

4 cu. ft. mixed concrete gasoline. 7 cu. ft. mixed concrete steam and gasoline. May be equipped with low charging platform, power charging skip and light duty hoist.

Send Back Coupon

The Dandie is not the cheapest mixer you can buy, but the sturdiest, strongest construction which makes it the remarkable value in the light mixer field. Send back the coupon.

American "Jewel" Bench Planer

American "Variety" Tilting-Table Saw Bench

American "Universal" Saw Bench

American "Triumph" Planer, Matcher and Moulder

"Furnishes All Necessary Mill Work"

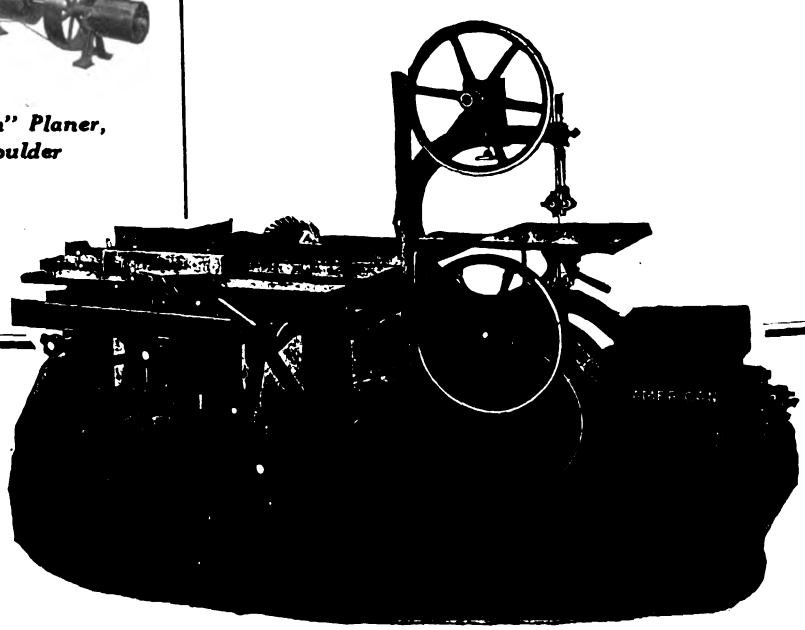
THAT is what Frederick Skon, a carpenter and builder of Jersey City, N. J., says about the American Contractors' Variety Woodworker.

His letter is as follows:

> "The Contractors' Variety Woodworker has proven very satisfactory in my shop. I cannot say what department the machine has proven most useful in, as the rip-saw, cross-cut saw, jointer and mortiser are in constant use by two men in my shop. I think it is sufficient recommendation for the machine to say it furnishes me with all necessary mill work."

Hundreds of contractors, builders and carpenters, the country over voice the same enthusiasm, on the all around utility of the "American" Contractors' Variety Woodworker.

Put an "American" in your shop and from the start it will prove a dividend paying investment in time and labor saved and volume of work turned out.



Write for Bulletin No. 77 that fully describes the "American" Contractors' Variety Woodworker and our line of woodworking machinery.

Builders!

You Will Appreciate These Three Exclusive Elastica Facts

Fact One—Elastica is the only Magnesite Stucco made that is shipped "Complete in a Sack" . . . a fact that insures absolute security in results obtained.

Fact Two—Elastica is the only waterproofed stucco on the market that we know of. This statement is made without reservation. Any test you choose to make will prove it.

Fact Three—Elastica alone of all stuccoes on the market is thoroughly crackproof. Granulated cork used exclusively in Elastica allows this material to give and take under strain—prevents the cracks so common in ordinary wall coverings.

These three advantages are exclusively Elastica advantages, demonstrated time and time again. Every contractor knows how vital they are to the lasting beauty and permanency of the buildings he plans.

A Book of Money Making Suggestions

There is an opening in your town to become the recognized store front builder. Every retailer desires a modern front and with the proper effort you can turn that desire into profit for yourself. This is a big store front year. Thousands of contractors throughout the country are making big money tearing out old store fronts and replacing them with modern fronts. Hundreds of these contractors are using "Desco" construction because it is practical, protects the glass, is permanent, easy to order, and because any carpenter can properly install it.

Turn to pages 819-827 of Sweet's Catalogue and you will find details of this modern and practical store front construction.

To be of help to you in going after the store front business in your town we have prepared a book which will be sent to you gratis; also full information, with details about "Desco," and will give you a price list so that you can figure the cost of a job right on the spot. Speed is an essential in building store fronts and we are prepared to co-operate with you.

Your letter will receive our prompt reply.

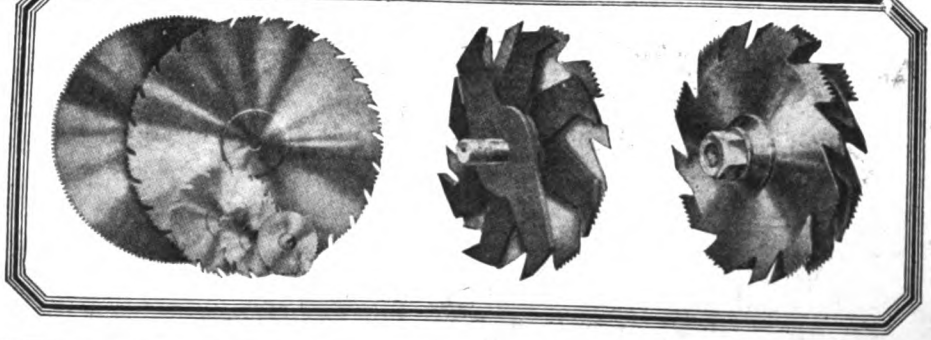
50 years of just plain "Know How"

have developed Huther Brothers Saws to a point equalled by none others on the market. This is especially well represented in our Patented Dado Head which is a most amazing means of simplifying intricate cutting.

It consists of two outside saws, each of which is a groover in itself, and as many inside cutters as necessary to perform the required cut.

This Dado Head cuts perfect grooves, either with or across the grain, and does not leave rough edges as is the case with ordinary groovers.

We will gladly send you a Dado Head on appoval which you may return at our expense if unsatisfactory.



Prestige that Dates Back to the Pioneer Days of the Saw

Among our vast assortments of:

Solid Tooth Circular Saws
Mitre Saws
Dado Heads
Solid Plate Groover Saws
Matcher Cutters
Lock Corner Cutters and
Specially Ground Circular Saws

you are bound to find a saw for every kind of woodworking you do.

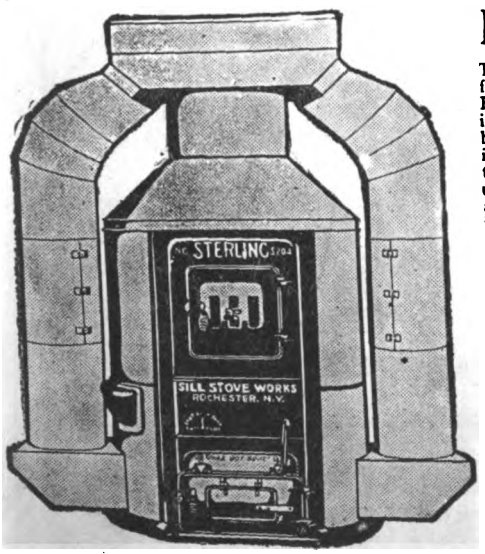
Comfy Warmth from Cellar to Attic Without Piping the House



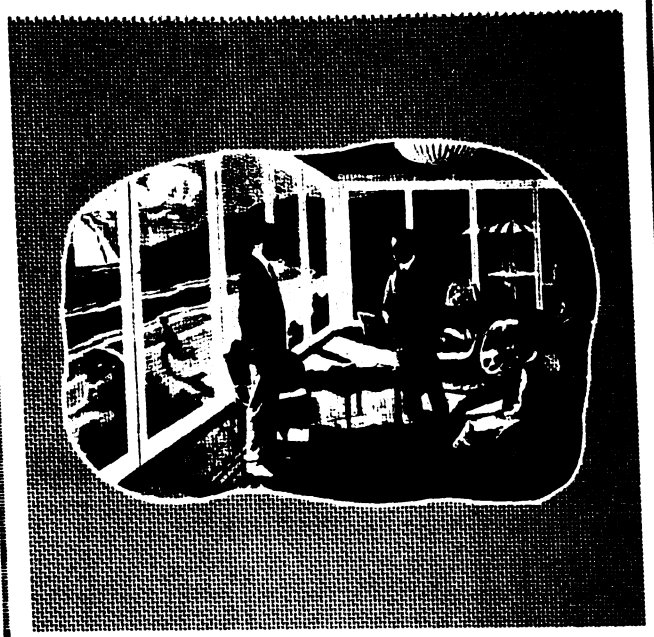
Comfortable o nthe floor where the children play. Warm by the windows where the women folks love to sew. Cozy everywhere! Homes that glow with warmth and cheer, without tearing up for pipes, without spending a lot of money, without burning a lot of coal.

N. P. Sterling Furnace

The One Register Furnace

has just one register and one pipe. It heats the house economically with a circulating current of warm, fresh air. It is the most satisfactory furnace of this type because it is better made, on bigger lines, of finer materials, than any other.

Here is a different furnace, totally different from any pipeless furnact you ever saw. For instance, the big, cool air return pipes (at either side of furnace—see picture), draw the cold air from even the most out-of-the-way rooms, starting the warm air circulating, and make them toasting warm even in zero weather.



HERE is a furnace that is built to last. There is not a cheap feature about it. Everything that goes into its making is the best to be had. For instance, just look at the grates—the big water chamber (moist air is best to live in)—see the way the joints are made so you can't get a bit of ash dust or coal gas or wood smoke in the house. It's a fuel saver, too. Actual tests show that it gives out more heat from less fuel than any other furnace. It's a quality proposition thru and thru, built to give real service.

Before you install any heating plant, be sure to investigate the N. P. at the reduced prices.

Write for a copy of the interesting booklet, Edition B.

SILL STOVE WORKS, Rochester, N. Y.

Makers of Sterling Ranges and Furnaces

THE VALUE OF

SCREENS OF PEARL

HOMES advertised for sale, or rent, which have a screened porch are in more popular demand.

When you talk porch screens—and now is the time to make them—install portable panels which lock together and close in the open sides of the porch.

To assist you in pointing out to your prospect the simplicity of construction and installation of screened porches, we have prepared a Blue Print of a Porch Plan which we will send free for the asking.

Screened porches are money-makers for you. Due to its metallic coating, a special process exclusive with us, PEARL is longer lasting, hence most economical, besides being the most sanitary and beautiful.

Insure your workmanship and customer loyalty by specifying PEARL and make sure of getting the genuine by looking for our round red tag on each roll and the two copper wires in the selvage—our permanent mark of identification.

Call on your local dealer or write direct for samples and literature if you're interested in screen material.

Address Dept. "C"

The Gilbert & Bennett Mfg. Co.

New York Georgetown, Conn. Chicago Kansas City

PEARL is made in Regular Grade (12x13 mesh) and 14, 16, 18, 20, 24 and 30 mesh; also Extra Heavy Grade (14 mesh only)

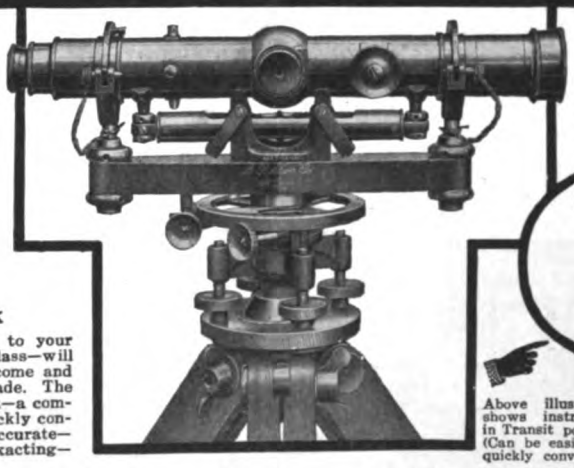
At last—A steel basement window that costs less than wood

TRUSCON STEEL BASEMENT WINDOWS

Truscon Steel Basement Windows are made in 2 standard sizes, 3-lights wide for 10x20" and 10x12" glass.



Home-builders have always wanted an indestructible basement window like this. Why install perishable wood sash when you can get Truscon Steel Basement Units that will last as long as the foundation? They swing in at the bottom like ordinary sash but they never warp or stick. The Truscon Steel Unit is ready to install—no fitting sash to the frame—no hinges and locks to buy—no extras at all. The window affords 50% more daylight than wood sash and double contact weathering makes it stormproof. The whole window is as easily installed as the wood frame alone in any type of foundation.

Get figures from your dealer before you build your house this Spring.

Level and Plumb With Your Own Instrument

$5.00 BRINGS IT TO YOU

Better, Quicker Work

This instrument will add immeasurably to your efficiency and put you in the big builder class—will do more to increase your business, income and prestige than any investment you ever made. The Aloe Convertible Level is the world's best—a combination of both level and transit and quickly converted to the use of either. Absolutely accurate—satisfies the requirements of the most exacting—yet so simple that anyone can use it.

Free Trial

Order the Aloe—try it for 10 days—put it to the most rigid tests. If you are not pleased, return it at our expense and your $5.00 will be refunded.

Above illustration shows instrument in Transit position. (Can be easily and quickly converted.)

FREE Write for this Book

BE A BIGGER BUILDER

Aloe Convertible Level and Transit Combined

You Learn to Use It In An Hour

No technical knowledge necessary. No previous experience needed. With our simple and complete instruction book, included free with every level, you can immediately put the instrument to work. It is a level and transit combined—takes sights either above or below the horizontal. You can use it for leveling foundations, walls, piers, streets, walks or curbings—to run straight lines for ditches or drains—boundary lines for fences or trees—surveying lots and fields—plumbing walls, shafts, trestles, posts and pillars.

Easy Monthly Payments

Just $5.00 brings it to you—for a free trial. If perfectly satisfied, pay the balance in small monthly payments. The instrument will be sent at once and from the first day it will be working for you—paying for itself by saving you the cost of borrowing an instrument or the fees you have been paying other men for this work.

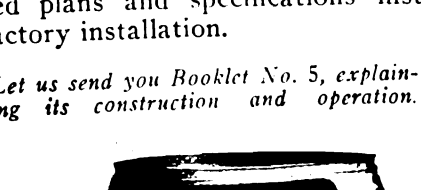
Residence of James H. Foote *Jackson, Mich.*

More Heat to the Ton



For thirty years the Kelsey Warm Air Generator has been making good. Bigger business in 1921 than ever before in its history, in spite of business conditions and the competition of other heating methods, is the kind of proof that warrants your confidence in Kelsey reliability.

Every part of its warm air tubes is in direct contact with the fire and the products of combustion, presenting unequaled heating surfaces in relation to the grate area and resulting in more heat to the ton than any other system.

It costs less to install than steam or hot water systems, lasts a lifetime with practically no repairs, and gives an abundance of heat at a remarkably small fuel cost.

Our Engineering Department will furnish detailed plans and specifications insuring satisfactory installation.

Let us send you Booklet No. 5, explaining its construction and operation.

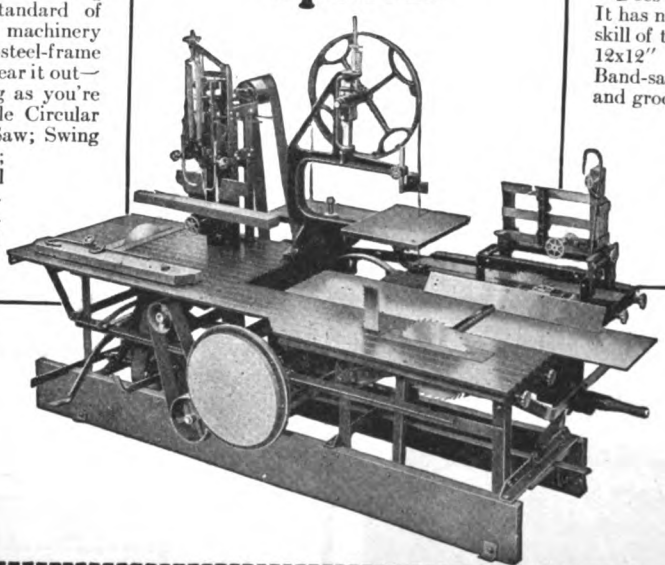
KNAPE & VOGT Garment Carriers

A Place for Everything and Everything in Place

ARCHITECTS and builders who do not know the Knape & Vogt Garment Care System are not giving their clients the benefit of the latest ideas in home convenience.

Although Knape & Vogt Garment Carriers may be easily installed in old fashioned closets, when planned for in new homes, they actually *save as much as* 15 *percent in construction costs.* Knape & Vogt closets are smaller, yet provide for more clothing, and keep it in *perfect order.* Installation is simple. Carriers made in lengths from 12 to 60 inches. Let us tell you how they operate.



Send for Full Details of Simple Installation.

KNAPE & VOGT MFG. CO., Grand Rapids, Mich.

What it is–

Eight necessary woodworking machines in one. The standard of high-grade woodworking machinery value. Stout, strong angle-steel-frame construction. You can't wear it out—it will work for you as long as you're in business. Double Table Circular Saw; Rip and Cross-cut Saw; Swing Cut-off Saw; Band Saw; Upright Hollow Chisel Mortiser and Borer; Tenoner; 12-in Jointer; Reversible Spindle Shaper; and Sander—all in one.

PARKS
Planing Mill Special

What it does–

Does everything in woodworking. It has no limit, except the mechanical skill of the man who runs it. Surfaces 12x12" timber. Rips 5" material. Band-saws 7" stock. Makes tongue and groove mill-flooring. Works any timber a man can handle and saves time, money, labor-hire, and hard work. That means a bigger business and more income!

Branded for Your Protection

YOUR guarantee in purchasing American Window Glass Co. product is the grade marking indelibly branded on the end of every box. The standards used in branding this product are so high that our "thirds" are difficult to distinguish from ordinary seconds, our "seconds" from many so-called first-quality lights. Buy in original 50-feet boxes and see that the branded grade marking has not been altered.

For General Glazing

American Window Glass Co. "A" quality lights (seconds) are suitable for high grade residence glazing and many public buildings. Our "B" quality lights (thirds) compare favorably with many seconds on the market. Serious errors in flattening, noticeable discoloration or marked defects are not permitted in "A" or "B" quality glass. Both grades are furnished in single and double strength, in all commercial sizes.

See Sweets Architectural Catalogue for details of our grading standards.

Herringbone spans 16 inches and therefore is particularly adaptable for the regulation frame building.

The Ceiling Danger

If you build for permanence and beauty, be sure to use a metal lath on your living room ceiling, and thus eliminate the danger of cracked plaster.

Consider also the fire risk. Protect the ceiling and you protect the floor. This is particularly important over the furnace room. "Herringbone"—designed to span regulation sixteen inch joist spacing—is ideal for this use.

The increase in cost is but a small fraction of the increase in value.

Send for illustrated literature.

When Your Customers Want Comfort

It's easy to fill a house with heat—but who wants to breathe hot air?

It's easy to fill a house with fresh air,—but how long will it stay fresh?

Stale or overheated air is devitalizing and poisonous, and continued cold air is more than uncomfortable.

But gently warmed fresh air, frequently changed by proper circulation and ventilation, is comfortable, refreshing and healthful.

THE

"FARQUAR"

SANITARY HEATING SYSTEM

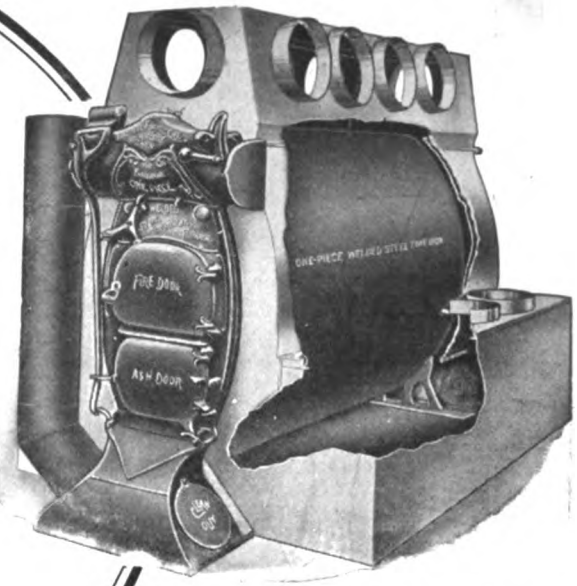
Is scientifically designed to furnish an ample supply of gently warmed fresh air ALL the time. It is almost impossible to appreciate the performance of the FarQuar System until you have analyzed its principles.

These Facts Furnish Distinct Advantages for FarQuar Dealers

—the FarQuar steel fire box electrically welded into one piece;

—the design of the fire-box—the avoidance of all irregularities minimizing friction — the absence of top surface;

—the automatic control—heat regulation and fuel saver—actuated by the fire-box itself.



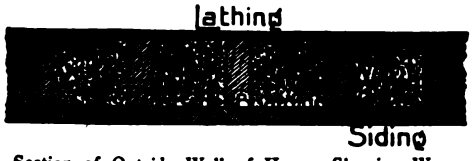
—the construction of the air chamber which conforms to the fire-box and provides ample capacity to handle a large amount of air.

—the FarQuar Vent and Return System.

Every FarQuar Feature has a scientific reason for its existence. Once you know the facts about FarQuar Construction, it becomes surprisingly easy to sell FarQuar Service. Ask us about it.

The Farquhar Furnace Company

504 FarQuar Building
Wilmington, Ohio



High Grade Representatives Wanted

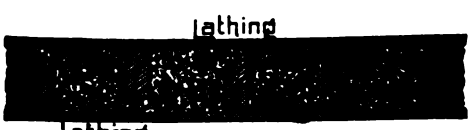
High grade, reliable, responsible men are wanted in every locality to act as exclusive distributors for the FarQuar System. An unusual opportunity is open to all who can qualify. Write for full particulars. Interesting booklet free.

To Contractors and Builders

When you recommend heating equipment to your customers, it is important that you know what that equipment will do. Ask us for Evidence from Users of the FarQuar System. And would you be interested in our Representatives' Proposition?

Section of Outside Wall of House, Showing Wool Between Studding.

Mineral Wool for Building



Mineral Wool has superseded all other materials used for similar building purposes because it does "a great work at little expense." A house lined with Mineral Wool has an indestructible, fireproof and vermin-proof guard; it protects the entire household. In the winter time it keeps the cold air out, facilitating proper heating and economy in fuel. In the summer it keeps the heat out.

This material, being of fibrous, inelastic composition, acts as a deadener and muffles all sound. It is considered the best insulator material on the market, making it a perfect refrigerating machine.

Mineral Wool makes life-long friends of all its users. If you are skeptical as to its power, let us demonstrate. We can prove all claims. Write us to-day.

The Hunter Electric Stair Router

For Stair Builders, Planing Mills, Contractors, Shelving, Box and Cabinet Manufacturers

Made Also as a Hand Router

The Hunter Routing Machines have demonstrated their efficiency in cutting the cost of this class of work to the lowest possible minimum. Cuts with the grain of the wood, right or left, as the case may require, at a speed of 3400 revolutions per minute. No forms are necessary. Simply lay out one tread and one rise and the Router does the rest. Instantly adjusted to any thickness of plank from one-half inch to two inches. For planks thicker than two inches, the machine can be raised by inserting wooden washers in the clamps at both ends.

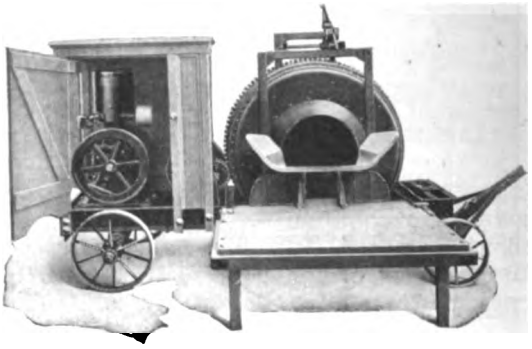
New Tape Hook
Makes
Pullman
Sash Balance
The 100% Window Device
With No Increase in Price

The new Tape Hook makes it possible to fasten or unfasten the tape from the sash while sash is in place. No fussing with the stop; no mars or scratches; no refinishing; no lost time.

Pullman Sash Balances are easy to install and cost less than cords and weights. They are cheaper, not alone in first cost, but also because any carpenter can fit 2 to 4 windows with Pullmans while he would ordinarily fit one with cords and weights.

Pullmans eliminate box frames too. That alone saves you real money and makes a tighter, better construction.

Pullmans are made of pressed steel, are entirely incased and constructed in 3 UNITS, K, L and M, adaptable to any kind of sash. Operate easily and quietly; last indefinitely, in fact are guaranteed for 10 years.



Free illustrated catalog, full of Modern Window Operating Information, sent on request.

A New and Better Coal Chute

Naturally you seek convenience and durability when you buy a coal chute. Here's one with steel side plates that form a hopper when chute is opened as shown in illustration. Note the steel shield that protects the house from damage. Door automatically locks when shield is lowered. Make sure you get the Stover. Ask for it by name.

STOVER

COAL CHUTES

Here are a few advantages: 1. Weatherproof. 2. Cannot be pried open from outside. 3. Can be opened and closed from cellar by chain. 4. Chain both unlocks door and lets it down easily—without jar or damage. 5. Operates easily and quickly. 6. Well finished cast iron frame, black enameled. Write us for literature and prices.

FORSTNER Labor Saving AUGER BIT

Bores Any Arc of a Circle

Many New Uses

The Forstner Auger Bit, unlike other bits, is guided by its circular rim instead of its center, consequently it will bore any arc of a circle, and can be guided in any direction regardless of grain or knots, leaving a true polished surface. Takes the place of a chisel, gouge, scroll-saw, or lathe tool combined. For core boxes, fine and delicate patterns, veneers, screen work, scalloping, fancy scroll twist columns, newels, ribbon molding and mortising.

Try it and be convinced.

Over 40 Years of Comfort and Satisfaction!

These cuts are made from actual photographs; —one shows a new chisel, the other shows one that has been in use 40 years and is still going strong! How many cheap chisels would have been needed in that time?

It pays to use the best—Barton Edge Tools and Planes.

Genuine only if stamped "D. R. Barton." If your dealer won't supply you we will.

Write for "The Carpenter's Catalog" and "True Stories." Free, of course!

MACK & CO., Brown's Race and Platt Street, ROCHESTER, N. Y.

Digitized by Google

Architect Geo. B. Rheinfrank, Toledo, O. secured this charming effect on C. M. Brown's Home, Auburn, Ind. with "CREO-DIPT" Special Thatch Roof and 24-inch Wide Exposure Silver Gray Shingles on sides.

"CREO-DIPT" Thatch Roofs are made possible by our ingenious method of sawing the thick ends of "CREO-DIPT" Stained Shingles in wavy lines so that workmen can lay in accordance with our instructions and details. All roof lines are softened; there are no sharp angles. The curved "CREO-DIPT" Stained Shingles are bent by us lengthwise and crosswise to meet specifications.

The architectural possibilities are unlimited and the effects secured exceed the charm of the original English Thatch. If you are interested in this type of roof, write for special book of "CREO-DIPT" Thatch Roofs.

If you are going to build or remodel, ask for Portfolio of Fifty Large Photographs of Homes by leading architects showing the use of regular "CREO-DIPT" Stained Shingles on roofs and side walls. Sample Colors on Wood. Ask about 4-in. "Dixie White" side walls.

TRADE MARK

When Buying Wall Board

Consider These Features

Compo-Board takes any form of decoration—wall paper, burlap, canvas, or it may be painted or kalsomined.

Does not require panel strips. Compo-Board has the extra strength needed to withstand hard knocks. It keeps out the dampness, heat and cold. Compo-Board Filler is especially prepared to conceal the joints and nail heads.

TRADE **Compo-Board** MARK

The Wood Core Wall Board

will not crack, crumble, shrink, warp or buckle.

No other wall board has ALL of these advantages. It insures a worth-while, permanent job that your customers will always be satisfied with. Write for sample interesting booklet of uses.

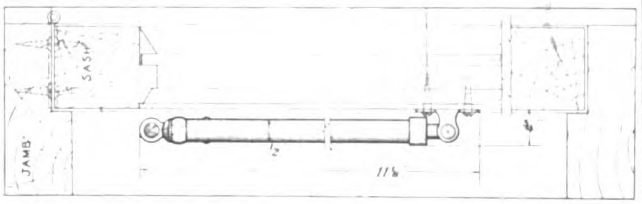
"Why is it, Jim

that some builders and contractors when they decide to buy a builder's level or transit, are not sure whether their instrument comes from the manufacturer or the middleman?



"You remove all doubt when you get a Beckmann. I went through their factory. I compared and tested their instrument side by side with other makes, at their risk. Then I bought a Beckmann under their money-back guarantee.

"That was ten years ago. Time has shown me that my judgment was right. Try the same test for yourself.

"Ask them for their catalog and free booklet, 'How to Choose an Engineering Instrument.'"

Just say BC-1 on a postal card.

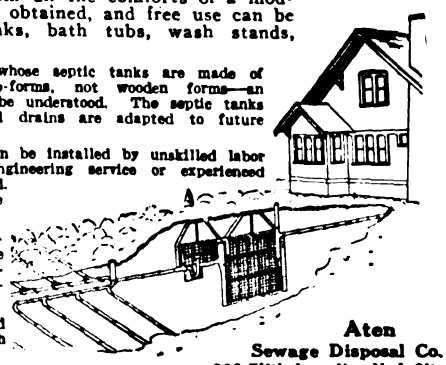
SEWAGE DISPOSAL

For Homes, Factories, Schools, Clubs, Hospitals, etc.
With the Aten System all the comforts of a modern city building are obtained, and free use can be made of toilets, sinks, bath tubs, wash stands, laundry tubs, etc.

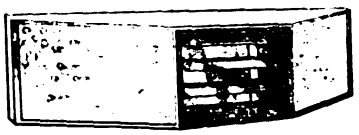


It is the only system whose septic tanks are made of concrete reinforced wire-forms, not wooden forms—an advantage which should be understood. The septic tanks as well as the sub-soil drains are adapted to future extensions.

It is a system which can be installed by unskilled labor without the need of engineering service or experienced supervision in the field.

Is adapted to single buildings or groups.

Our many years' experience enables us to give valuable service to Architects and Builders without obligation.



Send for our illustrated catalog No. 10 which tells all about it.

Aten

KEITH'S PLANS
FOR THE NATION'S HOMES

are nationally known plans with a reputation behind them. Illustrated from photographs of actual Homes built. They satisfy the demand of home builders for beauty, individuality, convenience and comfort.

Keith's Magazine is an authority on planning, building and decorating homes. For 23 years this $3 a year magazine has specialized in building homes of moderate cost.

SPECIAL OFFER Set of 12 plan books—3 of bungalows, 4 of cottages, 3 of 2-story houses, 1 of 2-family houses and one of garages—together with two years' subscription to Keith's Magazine—all for $6.00.

KEITH CORPORATION 554 Abbay Building, Minneapolis, Minn.

Improved Boring Machine

This machine is from new design, and no pains have been spared to make it a first-class machine in every respect. The spindle is made of crucible steel, has No. 2 Morse taper hole to receive chuck, and the bearings are of genuine babbitt metal. It has two stops to regulate the travel of the spindle, one in the head to adjust the downward stroke and one in the treadle for the upward stroke. Greatest length of travel of spindle is 6½ inches. Distance from center of spindle to column, 10". Table is 26" x 36". It is balanced and has a vertical movement of 21". Spindle is balanced by a coil spring attached to arm on top of frame, making it self-contained. The bracket that carries the driving pulleys has an adjustment of two inches, which is very desirable. T & L pulleys are 8" x 3" face, and should make about 800 revolutions per minute. If belt gets loose, loosen screws in front of bracket and by turning set screw on top till your belt is of the right tension.

LONG-BELL

TRADE MARKED LUMBER

These two attractive homes are from the Long-Bell Home Plan Service. There are more than sixty others, all equally interesting. The upper picture is Long-Bell Plan No. 360. The lower one is Long-Bell Plan No. 323. Ask your retail lumber dealer to show you the entire service. If he hasn't Long-Bell plans, write us and we will give you the names of dealers having this service.

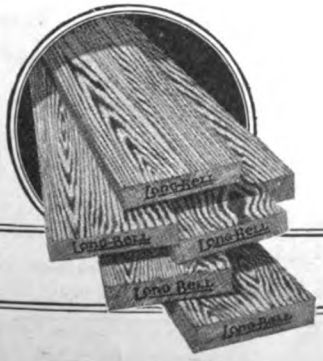
IS THERE any expenditure, any sacrifice, that brings returns equal to the building of a home of your own? What could be finer, what joy greater for any man than to see his family happy and contented *permanently* under a roof of their own!

Truly, a home is "an investment with dividends finer than gold."

Take the first step today. Go to a retail lumber dealer. Ask him to show you the Long-Bell home plan service. Select a home design that fits your needs and learn from the lumberman how economically Long-Bell homes can be built.

Southern Pine Lumber and Timbers

Creosoted Lumber, Timbers Posts, Poles, Ties, Piling Wood Blocks



California White Pine Lumber

Sash and Doors

Standardized Woodwork

Gum and Oak Lumber

Oak Flooring

Modern machinery, faithful adherence to high standards of workmanship, strict observance of the grading rules and dependable service have enabled The Long-Bell Lumber Company to apply the word Quality to its products —and these products bear the Long-Bell trade mark.

Ask Your Lumberman for LONG-BELL Brand.

Where Ambler Linabestos Wallboard Meets the need

IT has the qualities of permanence and fire-safeness along with attractiveness and convenient use.

Made entirely of the two most indestructible materials—long fibre asbestos and high grade Portland cement—rolled out, with pressure of 3,000 lbs. to the square foot, into a hard, non-warping, non-cracking wallboard of permanent buff color that can be cut with ordinary tools. Made 48 x 48 and 48 x 96 to fit standard joists.

Investigate Ambler Linabestos Wallboard for every interior lining use—partitions, wainscoting, hallways, libraries, game room, attics, bathrooms, kitchens, etc.

For exterior use—half-timbering, paneling, fire doors, trim and for interior use where unusual strength is needed, call for Ambler Asbestos Building Lumber.

For a snug-fitting, attractive, thoroughly fireproof roof, use Ambler Asbestos Shingles in the American, French or Honeycomb style.

You may have full information and specimens without obligating yourself.

CON-SER-TEX

— FOR —

ROOFS AND PORCH FLOORS

CANVAS ROOFING

For Flat Roofs and Porch Floors

—an attractive, water-proof, rot-proof, mildew-proof covering that will not crack, stretch, shrink curl or peel. The chemical treatment applied during manufacture makes it the most advantageous material for use in covering floors, flat roofs, sun parlors, sleeping balconies, and the like. Cool in summer and easy to keep clean. All these features explain why it has become such a favorite with owners.

Carpenters and builders should push "Con-ser-tex" Canvas Roofing, because it enables them to secure many contracts for work on which more expensive material would be out of consideration. If you show your clients how to save money on roofing, they will let you show what service you can render them in other directions too. Con-ser-tex is easy to lay, and brings a good margin of profit.

Write for illustrated booklet, "Roofing Facts and Figures," and for samples.

The original design from which the above house was built

First Floor

Plans that Sell Homes

THE American Face Brick Association has distributed over 200,000 copies of its various books on Face Brick Construction.

These books present 173 home designs by architects of high calibre, which have created a very wide-spread interest. A great many of the homes illustrated have already been built from the complete working drawings and masonry material surveys which the Association supplies at nominal charges.

Every contractor and builder should have the following booklets which will place in his hands the means for selling more and better homes.

The Story of Brick . .	No Charge
The Home of Beauty . . .	$ .50
Manual of Face Brick Construction	1.00
Face Brick Bungalow and Small House Plans (*Four Booklets; No. 1, 3-4 room; No. 2, 5-room; No. 3, 6-room; No. 4, 7-8 rm.*) each	.25

You can obtain these books separately, or the entire series of seven booklets for $2.50. Write Dept. B. 5.

Window Glass Grading Depends on Standards

FIRST, second and third quality are relative terms which depend on the standards used in grading.

The American Window Glass Co. grades its product to the highest standards in use in the United States. Its "A" (second) quality lights are hardly distinguishable from "AA." Its "B" (third) quality lights are practically as clear as ordinary seconds.

In using "A" or "B" quality single or double strength be sure the grade marking on the box has not been altered—high grading invites substitution.

When buying glazed sash by grade, make sure that American Window Glass Co. Product is used. This assures you the finest glass obtainable in that grade.

"Let in the sunlight"

The Room for Health and Comfort

IN EVERY home there is one room which breathes health and comfort, a real atmosphere of home. It will always be found to be the room with generous windows where the sunlight has free access. In this room the whole family loves to linger.

Rooms such as this add value to a house. When you build, whether for comfort or for speculation, give the windows careful thought. It pays to make them large and clear—and to have plenty of them.

Bridgeport Plumrite

Brass pipe for fresh water service has been made by us for more than 40 years. The mixture used for this pipe has not been changed.

Formerly, the brass was melted in crucibles and the fabricating operations were directed at all times by the foremen. Under these conditions the quality of the product depended upon the coincidence of personal equations.

Today, Bridgeport Plumrite Brass is made in electric furnaces, and from casting to the finished product every step is carried out in accordance with a definite program and is carefully controlled by tests at all stages of the process.

In the old days Bridgeport Brass Pipe was Plumrite most of the time *Today, it is* ***Plumrite all the time.***

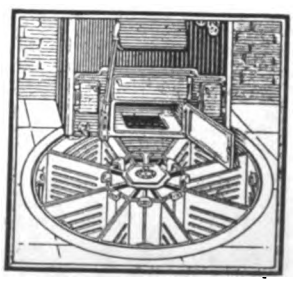
A Cleaner Cellar
For Every Home Purpose

By specifying the SHARP ROTARY ASH RECEIVER for your clients you give them a practical home convenience. Our owners are absolutely satisfied with this device that eliminates ash cans, ash dust and bothersome, unpleasant furnace work.

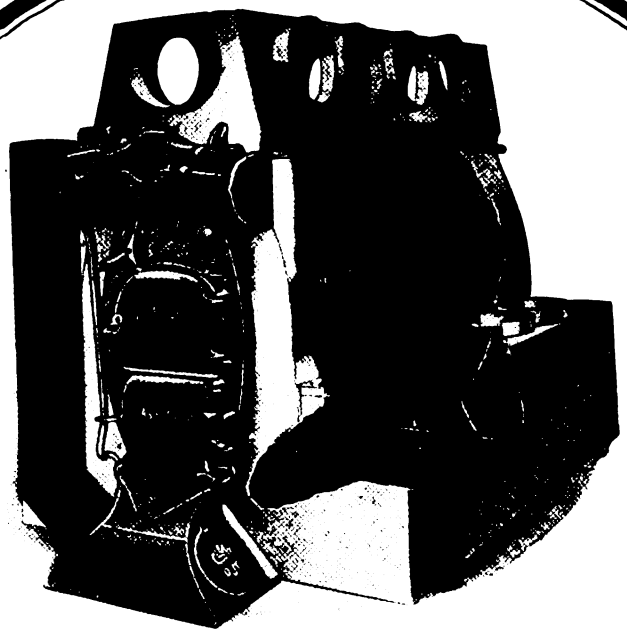
You can see how it changes the cellar, the possibilities it allows for making the cellar useful, liveable, cleaner and brighter.



No matter how well a cellar is built, or what the heater is, the ashes and ash cans are only out of sight when a SHARP ROTARY ASH RECEIVER is installed. It is this feature of cellar improvement that home owners seek. Write today for further information about this practical device.

A chain hoist for removing the cans is furnished as part of regular equipment.

Dealers, Builders or Agents desiring to sell this latest home convenience write today for particulars about your territory. Selling connections rapidly being made everywhere.



The cellar as clean as the rest of the house

What A Heating Engineer Said:

"Have read your literature. You have the right idea on ventilation and pure air. It does not take an expert to realize that the house furnace as commonly installed, is a source of foul heat and contaminates the air. Furnace gases pollute the air we breathe.

"There is something radically wrong with the accepted methods of house heating. After reading your literature, I believe you have solved this in a manner better than any other method of heating. You may send me your (Dealer) proposition."

The man who wrote the above is a prominent consulting engineer in New York,—an authority on heating and ventilating methods. His letter expresses in a few words, the basic reason for our enthusiasm and persistence in emphasizing the importance of the

"FARQUAR" SANITARY HEATING SYSTEM

Sooner or later, home owners must know that mere heat alone does not solve the heating problem. The dangers mentioned in the letter above are an ever-present menace in thousands of homes.

That the FarQuar Sanitary Heating and Ventilating System successfully overcomes the difficulty, is proven by the hundreds of letters written by our satisfied customers.

Are You Willing to Be Convinced?

There is nothing mysterious about the construction or operation of the FarQuar Furnace. It is most sturdily built as proven by the hundreds of jobs in continual use for more than 20 years. The fire-box is made of No. 6 gauge Keystone Copper Steel, nearly ¼ inch thick, which accounts for its sturdiness.

Send for Free Booklet and read the facts, then decide for yourself.

The Farquhar Furnace Co.
505 FarQuar Building
Wilmington, Ohio

Exclusive "FARQUAR" Features and What They Mean

Electrically Welded One-Piece Steel Fire-Box Positively prevents contamination of air by gases or fire poisons.

Storage Fire-Box with large grate area insures slow combustion and fuel efficiency.

Vent and Return System. Provides a generous supply of gently warmed, pure, fresh air instead of a hot blast of super-heated air.

Automatic Regulator actuated by fire-box, completely controls fire, insuring uniform temperature regardless of weather, with surprisingly low fuel consumption.

Sales Representatives Wanted

The story of the FarQuar System is being told to thousands who are learning the truth about house heating for the first time. The demand for our product is increasing and we need live, responsible Dealers and Sales Representatives in every locality. Write for full particulars at once.

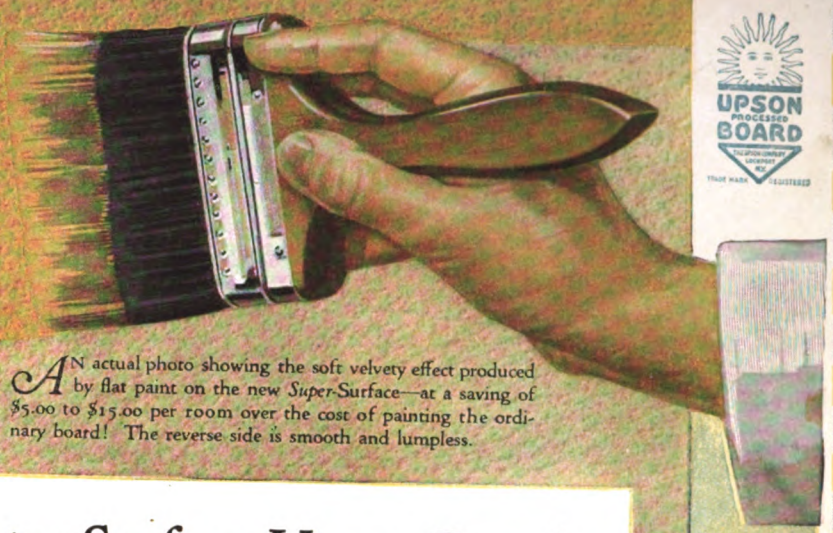
UPSON Board permits of decorative effects that will harmonize with any style of bedroom furniture.

SOME dining rooms are just places to eat — but this one has charm as well as utility.



UPSON Fibre-Tile makes clean, sanitary walls for bathroom or kitchen, barber shop or restaurant.

UPSONIZING is easy, quick and clean. No waiting for plaster to dry. The painter can follow right on the heels of the carpenter.

You can identify genuine Upson Board by its famous BLUE center →

AN actual photo showing the soft velvety effect produced by flat paint on the new *Super*-Surface—at a saving of $5.00 to $15.00 per room over the cost of painting the ordinary board! The reverse side is smooth and lumpless.

UPSON processed BOARD

TRADE MARK REGISTERED

Super-Surface Upson Board

is not only *stronger*, harder and stiffer, but now it is also the most *beautiful* board — it is a board you can conscientiously recommend and use!

"REFINED lumber" is what one contractor recently called new, improved *Super*-Surface Upson Board.

He was *right*! Super-Surface Upson Board is more woodlike than other fiber wall boards.

Carpenters enjoy working with Upson Board because it so closely resembles clean, knotless lumber.

It is easier to handle, cut and saw than the ordinary soft, weak board. Contractors tell us they can apply 25% more Upson Board—and do better jobs—than they can with weak, punky boards that easily break, like a graham cracker.

Because it enables them to make every job a satisfactory job—and because users of Upson Board are following the advice of Upson National Advertising to "let your carpenter Upsonize your house," carpenters and contractors realize more than ever before that it pays to specialize as Upsonizers. In April, national magazines carried this advice to more than 5,000,000 readers.

Have you seen this new, improved *Super*-Surface Upson Board—have you tested its strength—have you examined the beautiful new pebbled surface? If you haven't, at least put on *one* ceiling for some particular client, and see for yourself how *different* Upson Board is.

We shall be glad to send you samples so that you may judge for yourself the superiority of Upson Board. Ask your dealer to get Upson Board for you if he does not carry it.

Fittingly adapted fo

HERE is one of the most beautiful hotel dining rooms in New York State. It is in The Lincklaen House at Cazenovia, N. Y. Upson Board was used to make this room attractive. It is an excellent example of Upsonizing, and what it will do in creating an atmosphere of refinement in public buildings as well as in the finest of homes.

THE Upsonizing of The Lincklaen House at Cazenovia, New York, was done by C. H. Barrett, a local carpenter and contractor. Mr. Barrett used over 7500 square feet of Upson Board on this job. Wouldn't you be proud to have such a fine piece of work to your credit? You can, if you will but take advantage of the possibilities offered by this business-building activity.

UPSON BOARD

Digitized by Google

d for use in the finest of homes

The quality and strength of Upson Board have *again* been improved.

UPSON Board has always been a *quality* product! Now, it is even better than ever before.

It is being used to line every room in many of the finest homes every day being built all over the country — as well as other kinds of buildings.

And it is just as fittingly adapted for covering cracked and broken plaster walls and ceilings.

Best of all, from your standpoint, Upsonizing is the carpenter's job.

Your skill and experience are necessary to insure the most satisfactory installations of wall board. You know that most of the unsatisfactory wall board jobs you ever heard of were the result of one of two things: poor quality of board, or inferior workmanship on the part of the man who installed it—in the latter case, usually, a layman who was entirely unfitted to do the work.

Your ability, plus dependable Upson Board, can make an absolutely satisfactory job — a job of lasting beauty that will please the owner.

You are safe in recommending and using Upson Board. It is a product you can put your good name and reputation behind.

All around you, there are walls and ceilings that should be Upsonized.

It is pleasant work—all the year 'round. Upsonizing will *build* your business. One good job usually leads to others. Profits grow!

Right now, you doubtless know of many plaster walls and ceilings in your community that need repairing.

We will be glad to help you land some of these jobs. Write for samples of Super-Surface Upson Board, a copy of "Important Directions for the Correct Application of Upson Board," and other information about Upsonizing, the profitable, business-building activity for carpenters and contractors.

UNLIKE brittle, absorbent plaster board, Upson Board is neither difficult to apply nor costly to finish. It does not crumble and break, but cuts clean — with knife or saw.

ss than one complaint every 4,000,000 feet d and used.

Digitized by Google

Write to the Upson Company, 506 Upson Point, Lockport, N.Y., for samples of this new fastener.

This wonderful little device

enables you to make every Upson Board job one you can be proud of

NO more must you spend tedious hours countersinking nails in centers of Upson Board panels—no more can the painter spoil your good work by careless filling of nail holes *if you apply Upson Board with the Upson Self-Clinching Fastener!*

It holds the panels securely in place *from the back.*

It is easy to use. It cuts the cost of applying centers of panels in half, and eliminates the one big objection to wall board—disfiguring nail holes in centers of panels.

See below, the simple directions for using Upson Fasteners. They are the biggest improvement ever introduced in the wall board industry.

Send for sample fasteners, so that you may see for yourself just how they work.

Level studs or joists so that board will lie flat. If studs are uneven, furr with ½" or ¾" furring.

Drive flat-head coated or Upson In-To-Stay nails every nine inches on intermediate studs. Leave heads ¼" from wood.

Apply fasteners by slipping notch over nail-head. Drive nails home.

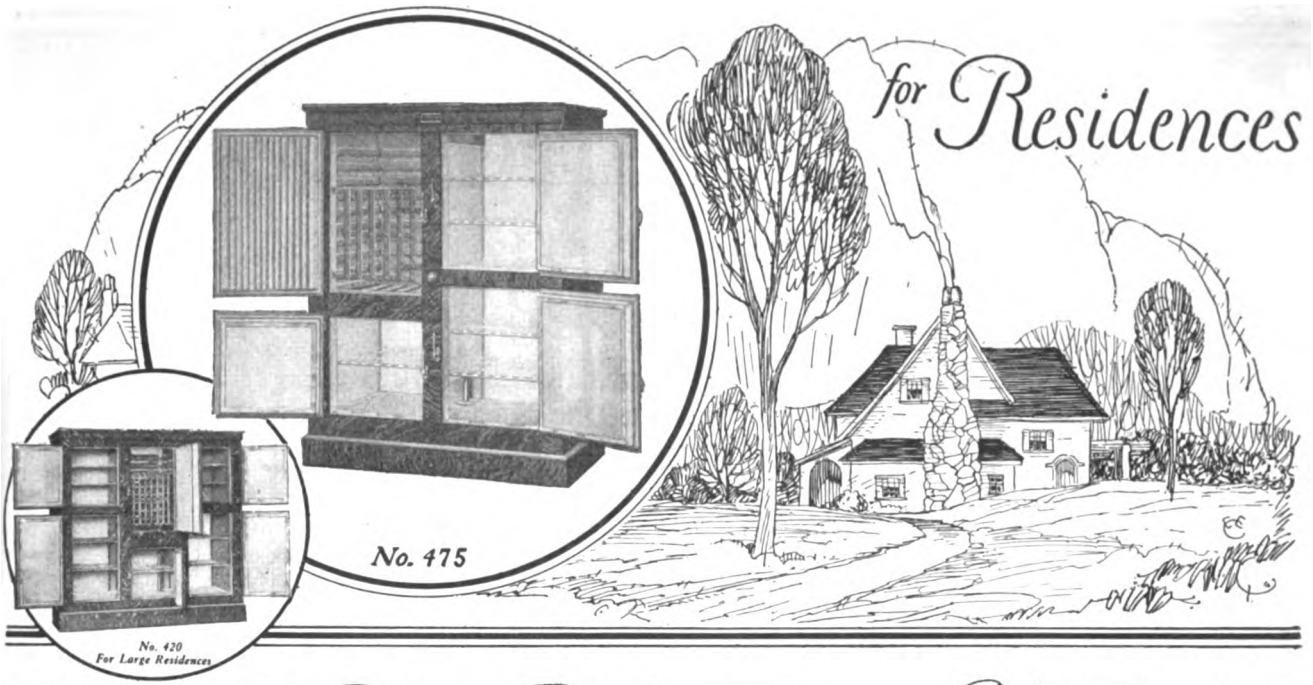
With fasteners in place, fit panel in place and drive four nails across top to hold securely.

Snap a white chalk line down panel on line of studs. Tap piece of two-by-four with hammer to drive board into prongs which will spread and clinch.

UPSON SELF-CLINCHING FASTENERS

Nail board around edges with 1" flat head nails every nine or ten inches. The panel is now ready for decorating. Not a nail-hole in sight.

To cover a ceiling, proceed as above. If working over old plaster, use furring strips.



You will be proud of the finished job. No nail marks, no pulling away from the wall.

To remove a panel, cut out the nails along edges, spring one edge of board and pry the board away from each fastener.

"YOU are doing, in your present advertising, the most constructive thing that has been done for the Building Industry in the past twenty-five years.

"For the first time, public attention is directed to the very kind of construction that every good carpenter and conscientious contractor *wants* to do and *will* do, when the people of the country are aroused to the price they pay for the cheap construction practices which are daily becoming more common."

Creating a Demand for Better Built Homes

THE above remarks, made by a prominent contractor and builder, whose business is largely house building in one of the large mid-western cities, refer to the Weyerhaeuser Advertising Campaign to prospective home owners, now running in such national magazines as The Saturday Evening Post, American Magazine and Literary Digest.

This campaign strikes directly at the real causes of house ills—for which the lumberman and the better class of contractors have been all too generously blamed. And the campaign is arousing people to a realization of the facts—as shown by the immediate response from all parts of the country.

Our advertising and literature is not intended as an instruction course in building. We do not pretend to teach carpentry to laymen. But we are stressing the importance of *good* construction and *good* houses, by contrasting actual examples of the kind of construction that pays and the kind that causes repair bills.

OUR purpose in this campaign is threefold. We want our products to deliver lifelong service. We know that an interest in better-built homes will lead to a wider employment of good craftsmen. We believe that it is time that prospective builders began to differentiate between the two kinds of competition.

As manufacturers of quality lumber for sixty-four years, we offer to the builders who demand *good* materials from which to do *good* work, ten different kinds of lumber for the varying requirements of house building—trade-marked in evidence of our belief in *right* material properly applied.

A BOOKLET, "The High Cost of Cheap Construction," outlining good construction practices, is being sent to prospective builders who answer our advertisements. We suggest that you send for your copy of it—or for such a supply of the books as you may wish to use in helping along this educational work among prospective builders.

"Good Houses" is another book which will interest good craftsmen. It deals with house design and the architectural possibilities of the wood-built house.

Weyerhaeuser Forest Products are distributed to the builders of the country through the more progressive lumber dealers by the Weyerhaeuser Sales Company, Spokane, Washington, with branch offices and representatives throughout the country.

Andersen Frames Save Time and Lumber

FROM a stock of 11 sizes of Andersen Standard Window Frames, the dealer can make immediate delivery of 121 different sizes of frames, simply by interchanging heights and widths. This convenience of immediate delivery represents a direct saving of time and money on the job.

Made-to-order frames must be ordered weeks in advance. Because they're made up in small quantities, they cost more money. Too often, delivery dates are uncertain. Andersen Standard Frames eliminate delays and unnecessary expense. Specialization gives many opportunities for saving of lumber and elimination of waste. These economies are passed on to users of Andersen Frames.

Andersen Standard White Pine Frames are accurately made. All exposed parts are made of genuine White Pine which endures for centuries without warping, rotting, shrinking or swelling. Windows fit snugly yet run easily in Andersen Frames because of the accurate White Pine construction.

No time is wasted in assembling Andersen Frames on the job. An Andersen Frame is packed in two compact bundles containing seven units. Using only a hammer, these seven units can be nailed up complete, with pockets and pulleys in place, in ten minutes, or less.

The Complete Story

On request, we will send an interesting book on the qualities and economies of Andersen Frames. Write today, and we will send a copy without charge.

University Homes

Interesting Community Development in Baltimore

HOMES that are built in groups by speculative builders, unfortunately, in the majority of cases, have a certain sameness that is monotonous. It, therefore is certainly interesting to find a group development that has been carried out with variety in design. Of course, for the sake of economy, one standard plan is usually adopted for use in all houses.

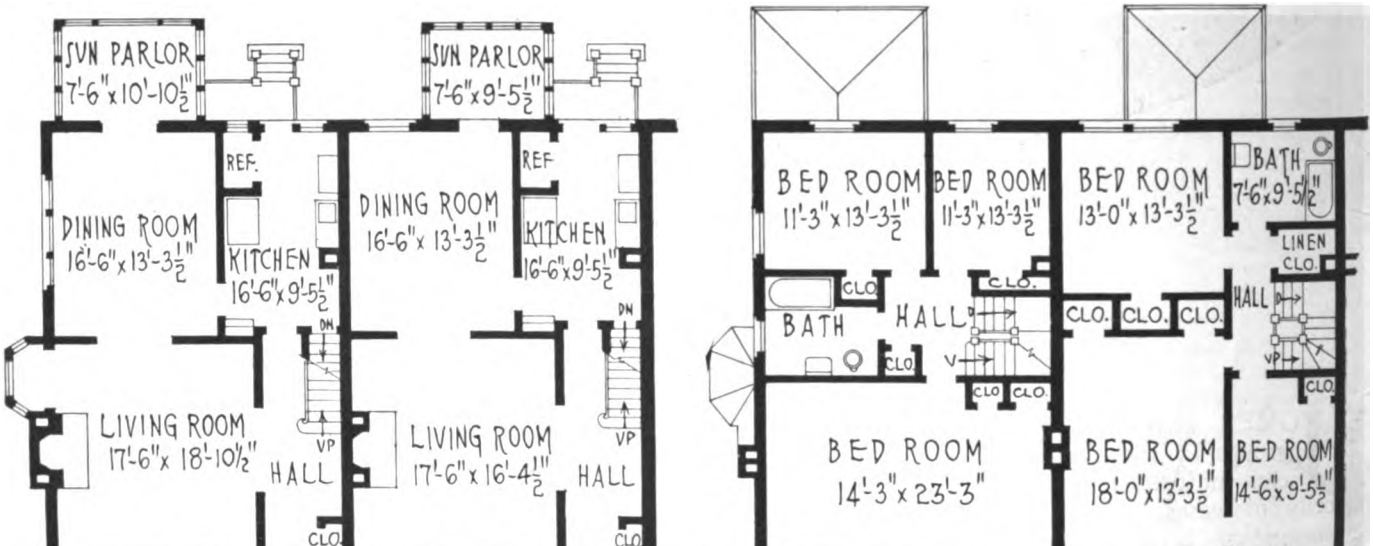
The above picture shows an interesting group of buildings called "University Homes" by its developer, Mr. George R. Morris of Baltimore, Md. This development is located at Canterbury Road and 39th Street, Baltimore, within a short riding distance from the heart of the city. The original property was the farm and garden of one of the old-fashioned large country houses. Mr. Morris laid out streets, put in sewers, sidewalks, curbs, gutters, underground electric service, water, etc. Also a rear driveway for automobiles and rather than wait for the city to pave the streets, this was also done.

An Inviting Front Entrance to a University Home

Mr. Morris was an architect by profession, who branched out as a speculative builder, and is now one of the leading operators in Baltimore. He is the designer of the buildings of "University Homes." He operates his own construction department; all the work on "University Homes," besides his other building projects, were all undertaken by his own organization. Different items, however, were let out to contractors, such as plumbing, electrical work, heating, etc.

Of course, by buying in large quantities and erecting in a wholesale manner, many savings were possible that would be entirely out of the question in the erection of one or even a few houses.

"University Homes" were built to meet the desires of apartment dwellers for a real home of their own, which contained all the conveniences of an apartment house. Mr. Morris conceived the idea of this unique development as the result of



Digitized by Google

On the other hand, the great disadvantage of an apartment life, even though in a measure the heating troubles are done away with, is the dependency upon the efficiency of a janitor, which, on an average, is not very high.

The apartment, of course, lacks the privacy of the individual home, and most important of all, the apartment house dweller loses the wonderful stimulus that home ownership creates.

In attempting to bring about the desired result in these homes the designer first eliminated the disagreeable features of heating by installing a steam heating plant, fired by gas and automatically regulated by a thermostat which needs no attention. The hot water is also provided in the same manner.

many years' experience in the designing and operating of apartment houses, as well as building a great many individual homes. In his contact with many renters, he learned just what features they desired the most. An effort was made to combine the advantages of both home and apartment, and at the same time eliminate the disadvantages of both.

The objections made to the individual home are the labor and responsibility of operation, such as care of the furnace, which entails a disagreeable job of handling ashes, the disposal of garbage, and other things of that sort. These are the things which drive people into renting apartments.

Digitized by Google

The always disagreeable matter of garbage and rubbish is overcome by the installation of the most modern and only efficient garbage incinerator.

The apartment house dweller is usually put to a great deal of inconvenience by his inability to secure garage space near his residence. Each one of the "University Homes" has a garage built in the basement—fireproof, heated and lighted.

The houses are built in groups of two or three. The exterior of every group is a little different from the others, and there are certain changes in details on each house, so that practically every house is different. The floor plans, however, remain practically the same.

The editor of BUILDING AGE and THE BUILDERS' JOURNAL recently visited Baltimore and obtained a number of pictures of these homes. We show three of the different varieties in this issue—half brick and half timber, all stucco, stucco and brick. Many of the houses erected are of all brick; one of these we will show in a future issue, together with the interesting story of how Mr. Morris sold his houses.

As shown on the floor plans, one enters the hall and on one side is a convenient coat closet, and the kitchen is located directly at the rear. Opening from the hall is a good-sized living room, practically square in shape; a large brick open fireplace forms an interesting feature of this room. In the end houses, as shown on the floor plan, a little ornamental bay window is an added feature to the living room.

The dining room is reached from the living room through a wide-cased opening. To the rear of the dining room is a sun parlor, closed off with French doors. This affords plenty of light to the dining room. On the end houses the dining rooms have windows on the sides as well as to the rear.

The kitchen is well laid out and planned, so that the work is most conveniently done. Plenty of closet room has been provided, and the cellar is easily reached directly from the kitchen.

Upstairs there are three bedrooms very conveniently laid out, with a minimum of hall space. The stairs extend to the attic, which is supplied with dormer windows, both front and rear, allowing for two additional bedrooms besides storage space. A very interesting feature of the attic is a cedar-lined storage closet.

All rooms have been provided with a number of electric outlets, so that different electrical devices can be easily attached. The bathroom is provided with the regular necessary fixtures, together with shower bath, glass shelves, towel bars, etc.

The cellar contains the laundry and garage. The garage is quite a feature of these houses. It is reached by a driveway placed at the rear of the houses. Our one picture shows the details very clearly; notice in this picture how the ice box drain has been run into the leader, this is a little idea that can be used in many cases.

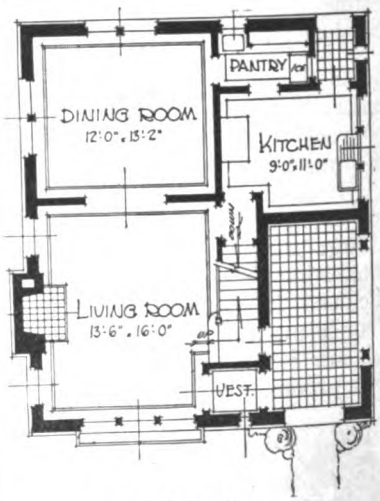
Conservative Little Home

Six Room House Specially Designed for Readers of Building Age and The Builders' Journal

By R. C. HUNTER & BRO., Architects

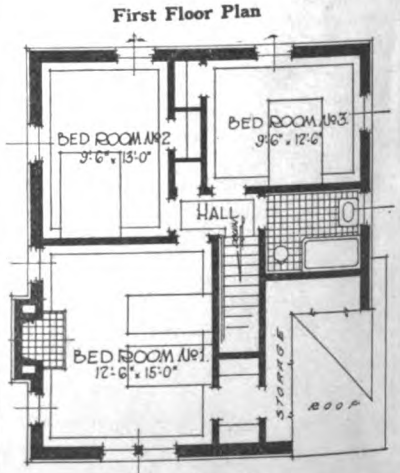
MOST of us like houses that appear substantial. Masonry construction with stucco finish and with simple detail gives one just this effect.

Then, too, the substantial house has a number of practical features that argue well for its adoption. First, there is the item of maintenance and repairs, a very important one, then there is the item of fire protection and insurance, together with the selling factor in case one decides to dispose of their house a few years after it is built. All point to good sound construction and conservative design.



In this little house the architects combine, with a substantial and attractive exterior, all of the advantages of a well laid out and economical plan, along conservative, practical lines.

Though none of the rooms are what one might care to call large, they are all of uniformly good size, providing comfortable living quarters for the average family. There is ample space for all of the required furnishings without cramping.



One enters the house through the porch into a small vestibule, the usual hall being eliminated. This arrangement gives over all space to the living room where it is most desired, while the vestibule gives privacy at the entrance that would be lacking should one enter directly into the living room.

The stairs form a decorative feature on one side of the living room with the fireplace opposite.

A group of windows that occupies the full length of one side of the kitchen gives plenty of light where it is most needed. The complete equipment of the kitchen and the adjoining pantry gives assurance that the

First Floor Plan

Second Floor Plan

Digitized by Google

"business end" of the house has not been overlooked. It has been laid out for convenience, comfort and economy. The heater room, laundry and storage space are located in the well laid out cellar.

The second floor has three good bedrooms and a bath. The bath is tiled and the tub is built in, giving not only an attractive appearance but also saving time in cleaning. The hall has been reduced to a size that allows room for the necessary doors to the various rooms and the required free space, but no more. This allows the room to be given over to more useful space such as the bedrooms. The small hall also shortens steps to the bathroom both from the bed rooms and from the stairs so that it is readily reached from the first floor.

Cost to build, about $7,800. Complete working plans and specifications of this house will be furnished for a nominal sum by BUILDING AGE AND BUILDERS' JOURNAL.

Quantity Survey *of* Conservative Little Home

(Shown on preceding page)

THE quantities given are for estimating. All measurements are NET unless otherwise noted; areas given for such items as sheathing, flooring, etc., are net areas to be covered, with no allowance for matching, waste, etc. Minor outs have been disregarded.

Such items as clearing site, temporary work and protections, scaffolding and general equipment and supplies have not been included.

Such items as are marked "Unit" are to be estimated in a lump sum, following requirements of plans and specifications.

Excavation

(Excavation for pipe trenches not included)

Excavation for cellar	189 cu. yds.
Excavation for footings	16 cu. yds.
Excavation for areas	13 cu. yds.
Excavation for leader drains and dry wells	9 cu. yds.
Excavation for trench walls	14 cu. yds.
Backfilling around walls, etc	34 cu. yds.
Leader drains and dry wells:	
Field stone for dry wells	5 cu. yds.
4" Salt glazed tile drain pipe	24 lin. ft.
4" Elbows	4

Masonry

Concrete work:	
Concrete for cellar walls	800 cu. ft.
Concrete for footings	290 cu. ft.
Concrete for trench walls	68 cu. ft.
Concrete for area walls	218 cu. ft.
Cellar floor (3" concrete and 1" cement finish)	560 sq. ft.
Area bottoms (brick and sand)	42 sq. ft.
Outside cellar steps (concrete cem. faced)	45 sq. ft.
Porch floors (12" cinders, 3" conc. and brick finish)	116 sq. ft.
Concrete forms	2300 sq. ft.
Reinf. conc. window lintels, concrete	60 cu. ft.
½" Sq. Steel Rods:	
10'-0" long	4
7'-0" long	2
⅜" Sq. Steel Rods:	
4'-0" long	22
Pointing cellar window sills	19 lin. ft.

Hollow Tile

8" x 12" x 12" block (or 1200 blocks)	1200 sq. ft.
10" x 12" x 12" block	120 blocks
4" x 12" x 12" block for corners	80 blocks
8" jamb blocks	150
1" leveling slab	60

Brick Work

Common brick work for chimney (Or 6 M.)	300 cu. ft.
Face brick for sills, etc	600 brick
Face brick for fireplace hearth and jambs. (or 224 brick)	32 sq. ft.
Fire brick for fireplace (or 200 brick)	40 sq. ft.
12" dia. T. C. flue lining	80 lin. ft.
6" dia. T. C. Ash chute lining	14 lin. ft.

Masons' Iron Work

Fireplace damper (3' 0" opg. with throat, etc.)	1 unit
Fireplace damper (2' 8" opg. with throat, etc.)	1 unit
C. I. Ash dumps	2 units
C. I. cleanout door for ash pit (16"x12")	1 unit
C. I. cleanout door for boiler flue (8"x8")	1 unit
Thimble for boiler flue (8" dia.)	1 unit
Anchor bolts for wall plate (¾" dia. x 24" long with 4" washer and nut)	34

Plastering

Three coat Patent plaster on wood lath, Gross (Net 310 sq. yds.)	390 sq. yds.
Three coat Patent plaster on hollow tile, Gross (Net 97 sq. yds.)	135 sq. yds.
Dampproofing under stucco....Net	2200 sq. ft.
Stucco on hollow tile, etc....Gross (Net 220 sq. yds.)	260 sq. yds.
Stucco on metal lath	21 sq. yds.
Cast concrete brackets for flower boxes	2 units
G. I. corner beads	60 lin. ft.

Tile Work

Tile work for bathroom:	
Floor (1" hex. white)	38 sq. ft.
Wainscot (3" x6" white wall tile)	140 sq. ft.
6" base	14 lin. ft.
Cap	33 lin. ft.

Sheet Metal Work

Tin flashings for roofs, etc	11 lin. ft.
Tin flashing and counterflashing for chimney, etc.	10 lin. ft.
Chimney cricket	8 sq. ft.
Tin Valley lining	34 lin. ft.
4" half round hanging gutter (galvanized iron)	70 lin. ft.
3"x4" G. I. leaders	9 lin. ft.
Bends for same	2
Ornamental heads	1
Gutter thimbles	1
3" dia. tin leaders	54 lin. ft.
Bends for same	6
Gutter thimbles	3
3"x4" G. I. gas range vent	21 lin. ft.
Cap and thimble for same	1

Carpentry

Timber:

All No. 1 common stock, hemlock, rough unless noted.

Cellar girders:	
6"x10" spruce—1/18, 1/12	150 F.B.M.
2"x3" nailer—52 lin. ft.	27 F.B.M.
Wall plates:	
3"x8"—2/16, 1/14, 6/12, 1/8	252 F.B.M.
Studs, girts and plates, 1st floor:	
2"x4"—32/16	342 F.B.M.
Studs, etc., 2nd floor:	
2"x4"—47/16	500 F.B.M.
1st floor joists:	
2"x10"—21/14, 12/12	730 F.B.M.
2nd floor joists:	
2"x10"—22/14, 11/12, 7/10	894 F.B.M.

Carpentry—continued

2nd floor ceiling joists:		
2"x6"—17/14, 9/12, 9/10	436	F.B.M.
Rafters:		
2"x6"—52/12	625	F.B.M.
Hips and ridge:		
2"x8"—4/12, 2/10	91	F.B.M.
Valleys:		
3"x8"—2/18	72	F.B.M.
Floor bridging:		
2"x3"—250 lin. ft.	125	F.B.M.
Cellar partitions:		
2"x4"—14/14	132	F.B.M.
Sheathing (7/8"x8" shiplap):		
Walls—to cover	112	sq. ft.
Sheathing paper (waterproof)	150	sq. ft.
Shingle lath (7/8"x3")	2700	lin. ft.
Grounds (3/4"x2", surfaced one side)	1700	lin. ft.
Sheathing for cellar partitions (7/8"x8" shiplap)—to cover	215	sq. ft.
Rough flooring (7/8"x8" shiplap) 1st floor —to cover	550	sq. ft.
Furring (7/8"x2")	300	lin. ft.
Shingle roofs (18" stained shingles) 136 squares	8700	shingles

Exterior Finish

Raking cornice:		
7/8"x2½" fascia	64	lin. ft.
5/8"x7/8" strip	64	lin. ft.
Half timber work—7/8"x5"—1/12, 1/14, 3/8	50	lin. ft.
Sawed brackets	2	
Flower box:		
(1⅛" wood boxes lined with zinc)		
12"x12"x9'6" long	1	unit
Porch finish:		
7"x7" box. cols. 8'0" long with cap and base (solid stick)	2	units
7"x7" head timber 10'0" long	1	unit
Cellar bulkhead:		
7/8"x6" matched and beaded N. C. pine	65	sq. ft.
5/8"x7/8" cove	20	lin. ft.
Windows:		
Frames complete with sash, outside trim, etc. Sash 1½" thick, glazed D. T.		
Cellar windows:		
Single top hung sash, casem, 3'0"x2'0", 4 light	4	
Mull. sash, ea. 3'0"x2'0", 4 light	1	
First floor windows:		
Triplet D. H. sash, ea. 2'4"x4'10", 12 light	1	
Mull. D. H. sash, ea. 2'4"x4'10", 12 light	1	
Single D. H. sash, 2'6"x3'2", 12 light	4	
Mul. D. H. sash, ea 2'6"x3'2", 12 light	1	
Triplet D. H. sash, ea. 2'6"x3'2", 12 light	1	
Single casem. sash, 8"x2'10", 3 light	1	
Mull. D. H. sash, ea. 2'4"x4'6", 12 lights	1	
Single D. H. sash, 2'4"x4'6", 12 light	2	
Single D. H. sash, 2'8"x4'6", 16 light	4	
Shutters (1⅛" thick solid paneled):		
2'4"x4'11" pr.	2	pr.
2'6"x3'3" pr.	4	pr.
Blinds (1⅛" thick, movable louvres, solid upper panel):		
2'4"x4'7" pr.	3	pr.
2'6"x3'3" pr.	1	pr.
2'8"x4'7" pr.	4	pr.
Exterior door frames (1¾" thick rabbeted), complete with outside trim:		
Frame for front ent. door, 2'8"x7'0"	1	
Frame for rear ent. door, 2'8"x7'0"	1	
Frame for cellar ent. door, 2'10"x6'6"	1	
Exterior doors (all to detail):		
Front ent. door, 2'8"x7'0"x1¾"	1	
Rear ent. door, 2'8"x7'0"x1¾", glazed	1	
Cellar ent. door, 2'10"x6'6"x1¾", 5 cross panel	1	

Finished flooring:		
Living room, dining room, ent. vest. plain sawed white oak, 13/16"x2¼"—to cover	370	sq. ft.
Kitchen, etc., No. 1 maple 13/16"x2¼"—to cover	129	sq. ft.
Second story, No. 1 comb grain Y. P., 7/8"x2¼"—to cover	491	sq. ft.
Lining paper under floors	500	sq. ft.
Rear porch floor, 1⅛"x3" cypress—to cover	18	sq. ft.
Slat floor under laundry tubs, 3'0"x4'0"	1	unit
Joist hangers (1/4"x2" W. I.):		
For 2"x10" beams	8	
For 4"x10" beams	5	
Beam anchors, 3/8"x1½"x18"	28	
Cement filled pipe cols. in cellar, 4" dia. x 7'6" long, with caps and bases	2	

Interior Finish

(Whitewood unless noted)

Door trim:		
7/8" jambs, 1/2" stops, 7/8"x4½" moulded and mitered trim with wall moulding. Trim both sides.		
For doors, 2'6"x6'8"	6	sets
For doors, 2'4"x6'8"	6	sets
For doors, 2'0"x6'8"	1	set
For cellar doors, etc. (plain), 2'6"x6'6"	2	sets
For door, 2'10"x6'6"	1	set
Trim for inside of exterior doors:		
Front ent., 2'8"x7'0"	1	set
Vest., 2'8"x7'0", both sides	1	set
Rear ent., 2'8"x7'0"	1	set
Trimmed openings finished same as for doors:		
Opg., 5'0"x6'8"	1	set
Trim for windows:		
7/8"x4½" moulded and mitered trim with wall moulding, 1/2" stops, 1⅛" moulded stool, 7/8" moulded apron, 5/8"x7/8" cove under stool.		
For windows, triplet, ea. 2'4"x4'10"	1	set
For windows, mull., ea. 2'4"x4'10"	1	set

For windows, mull., ea. 2'6"x3'2"	1	set
For windows, triplet, ea. 2'6"x3'2"	1	set
For windows, single, 8"x2'10"	1	set
For windows, mull., ea. 2'4"x4'6"	1	set
For windows, single, 2'4"x4'6"	2	sets
For windows, single, 2'8"x4'6"	4	sets
Base, 7/8"x6", moulded	300	lin. ft.
Base, 7/8"x4", plain	50	lin. ft.
2" base mould	300	lin. ft.
1/2" quarter round at floor	350	lin. ft.
Picture moulding, 7/8"x2¼"	340	lin. ft.
Mantel for living room	1	unit
Interior doors:		
(2 cross panel birch veneer)		
Door, 2'6"x6'8"x1½"	6	
2'4"x6'8"x1½"	6	
2'0"x6'8"x1½"	1	
Glazed vestibule doors, 2'8"x7'0"x1¾"	1	
Solid pine cellar door, 2'6"x6'6"x1½"	1	
Batten door, 2'6"x6'0"	1	
Closet shelving, 7/8"x12" pine	24	lin. ft.
Hook strip (7/8"x4")	14	lin. ft.
Rabbeted shelf cleat	16	lin. ft.
1" dia. pipe clothes rod	10	lin. ft.
Pantry cupboard with countershelf, drawers, doors, etc.:		
Front, 7'0"x8'0"	1	unit
Main stairs, 1st to 2nd story:		
14 risers, 3'2" wide, box pattern, etc.	1	flight
Cellar stairs, 12 risers, box pattern	1	flight

General Conditions

Add for permits, fees for water and sewer connections, etc., insurance and general overhead charges.

Allow for general work not listed, such as grading, planting, etc.

Include sub-bids: Hardware and applying same, painting and decorating, plumbing and gas fitting, heating, electric work.

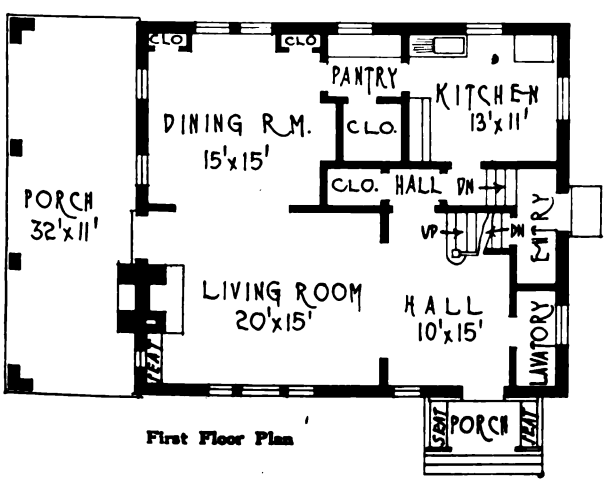
The House by the Lake

Designed by C. E. SCHERMERHORN, Architect

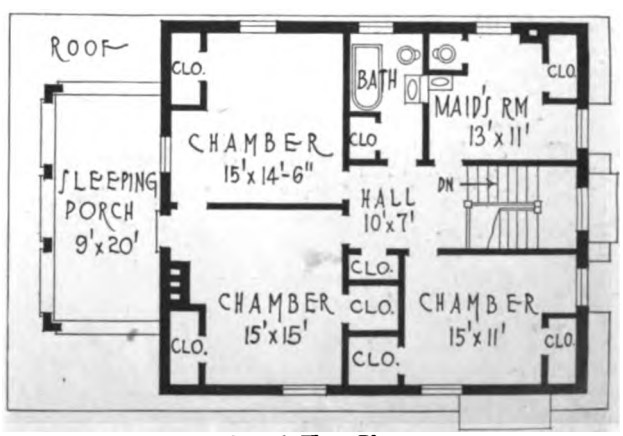
WHAT could be more truly ideal than the house and its site shown on our front cover, bathed in the soft glow of silvery moonlight?

We show on this page another view of this home, together with floor plans, which will show the arrangement of the different rooms. This house was recently built at Yardley, Pa., from plans prepared by Mr. C. E. Schermerhorn, Architect, of Philadelphia. The house, as pictured, was built of hollow tile covered with stucco.



There is a very interesting and convenient layout to this home. Perhaps the one feature that would interest most folks is the extra large porch, which is 11 x 32′ in size. This faces directly towards the lake, and from which an inspiring view of the surrounding country can be obtained. A feature of this porch is an open fireplace. From the porch, the dining room and living room are entered.

The lines of the house are very well proportioned, so that it presents a very pleasing appearance. The hood over the front entrance doorway is about the only piece of ornamentation used, the entire beauty of design being obtained by proper proportion and in the symmetrical grouping of the windows.



The entrance to the porch has a seat on each side, and the whole effect of this entrance is somewhat along the lines of the Dutch Colonial.

One enters a large 10 x 15 foot reception room. On the right there is a small lavatory, and to the left is a cased opening to the living room. The stairway to the second floor is at the rear of this hall, and off to one side is a large coat closet.

While the rooms are all large, the house is not overlarge, being 32 x 37 feet, exclusive of porch. It certainly is a very interesting example of a convenient home, and its pleasant location certainly makes it an ideal home.

Summer Homes *for* Sea Side *and* Country

By CHARLES G. PEKER

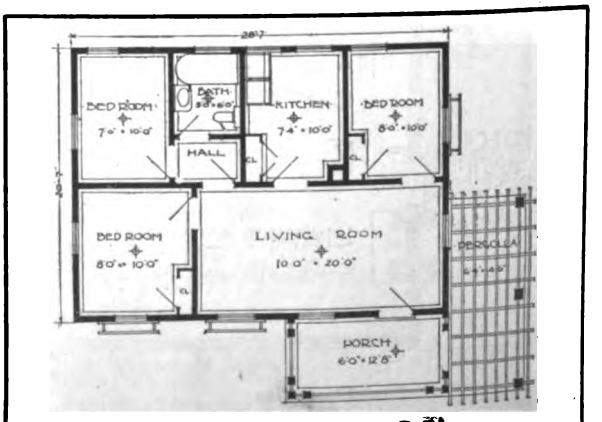
BUILDING summer homes is a profitable line of work for the building contractor. These homes are usually of the bungalow order, built for occupancy for a few months of the year only. They seldom have cellars or foundations, outside of posts. In the majority of cases even masonry posts are dispensed with and wood posts are used to support the building.

The ordinary type of a summer bungalow has been rather crude in most localities. At some of the seaside colonies and lake colonies they are nothing more than unattractive-looking shacks and therefore our few designs along this line will be welcomed by builders, as they give something out of the ordinary and at very little added expense.

The summer bungalow is a place to rest and loaf in and everything around it can be fixed with the idea of cutting out work.

Summer bungalow colonies are being built in the vicinity of nearly all large cities; they are usually situated on the shores of some lake or the seaside. The lots are in some cases rather small, necessitating small houses, and another reason why everything is made small for the summer type of bungalow is the expense and the big item of taking care of it.

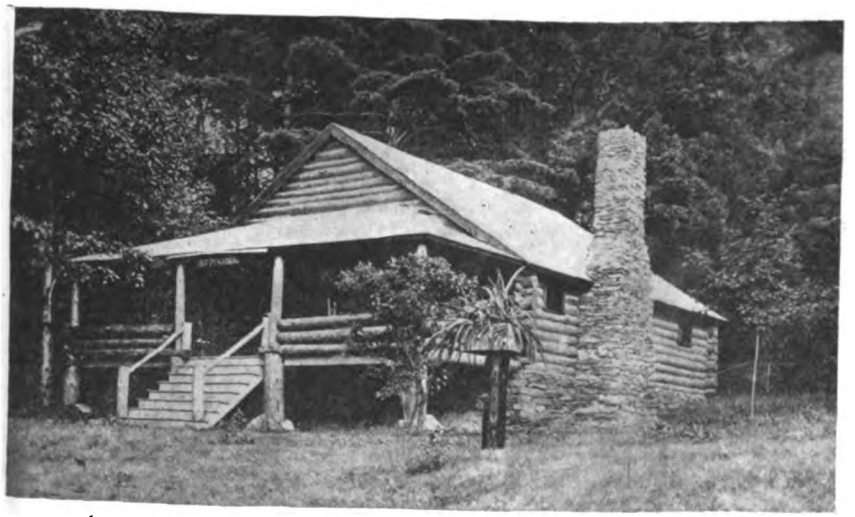
Mothers and Kiddies Enjoy the Sea Side That's Why Summer Homes Are Popular



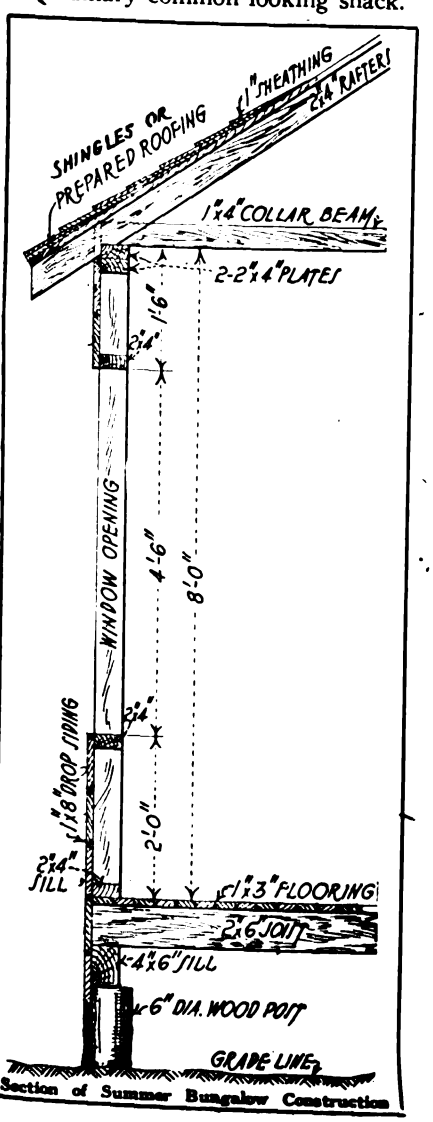
The idea of the summer bungalow is to give one a vacation and therefore everything is cut down as much as possible. The house is merely to give shelter during stormy weather and to sleep in. People going to these places usually live out of doors; still they like a pretty looking place. The alert builder will be ready to give the people what they desire.

The sectional view shows a method of construction that is suitable for building a summer bungalow. This is a good form of construction and while it takes a little more timber than is sometimes used, it gives a neat finish inside, besides making more of a rat and mouse-proof structure.

The construction of a summer bungalow is somewhat radically different from that of a regular all-the-year-round type of building. Being only for summer occupancy it is only necessary that it be rain and wind-tight and sometimes even the wind-tight property is of not very much account.



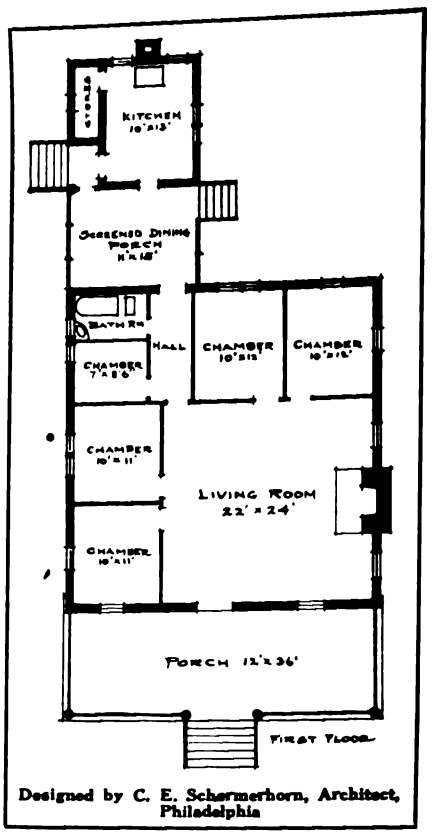
Many people who have camped in tents are now occupying a more permanent abode, that is, a simple summer bungalow, as it is termed. Quite a number have been erected and in many cases there are, unfortunately, nothing more than shacks, now at but very little added expense they can be made better and have a pretty look, something that one will be proud to own and that will please the lady folks. Everybody likes a good-looking place and if the builder submits a good design he gets the order.



Minter Homes Company, Builders

Digitized by Google

The few pictures shown herewith show how even a cheap summer bungalow can be made an object of beauty at but very slight cost over the ordinary common looking shack.



Section of Summer Bungalow Construction

The first point that is to be considered is the foundation. In practically every case posts will be used; chestnut or locust, about 5 or 6 inches diameter seems to be about the favorite material to be used. These must be set below frost—from 3 to 3½ feet is usually sufficient. It is best to either tar or creosote these before being placed in the ground, but in the majority of cases this is not done. Of course if there are a number of stones lying around it would be best to make the piers of stone. These should be about 14 x 14". Of course, they should go below frost.

Even the Smallest of Bungalows Can Be Attractive in Design

If preferred, brick or hollow tile can be used. One method that we have observed is to use clay pipe about 10" diameter and fill this solid with concrete. Of course, if concrete is used it must be put in molds, or if concrete blocks are to be had they can be used.

If the bungalow is to be erected on marshy ground a mud sill should be used on which to set the posts. This consists of as big a piece of

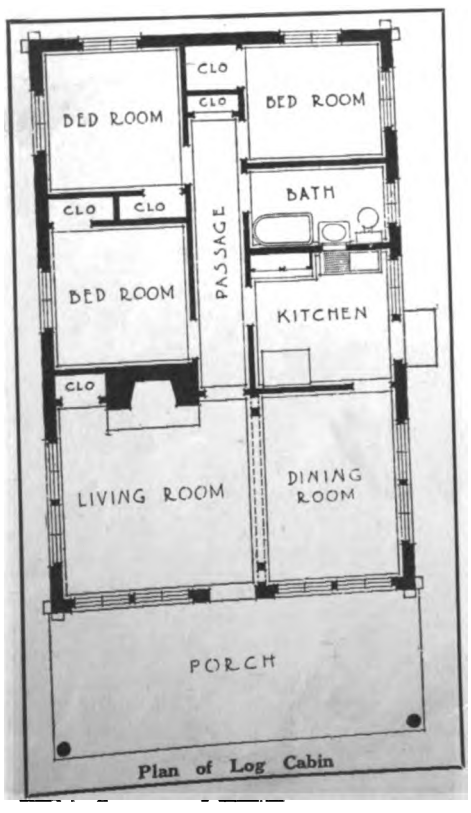
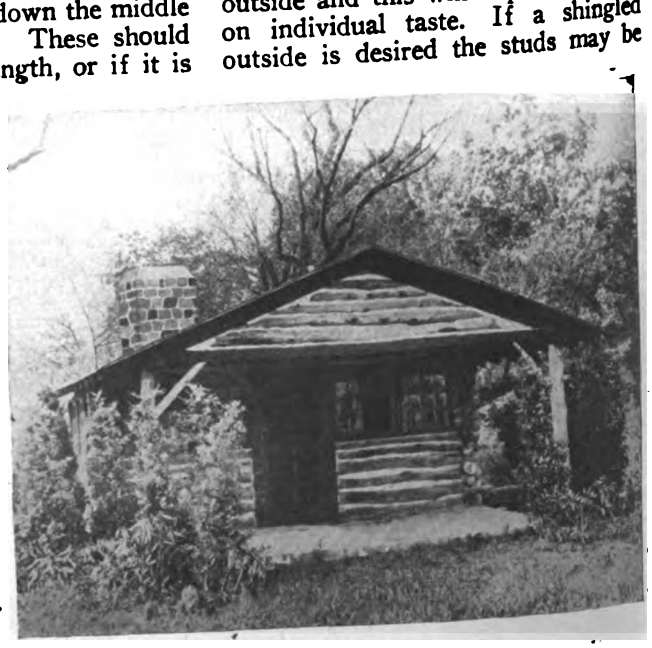
Plan of Sea Side Bungalow

timber as can be had and it should be long enough in the one length to go either the width or the length of the building. If the ground is rather low and the bungalow is to be set high, that is, over 3 or 4 feet, it is necessary that the posts supporting the sill should be braced diagonally by 2 x 4. This method throws the weight of the entire building over a bigger area of ground, which, if it is not done would cause some posts to sink directly into the marsh. This has frequently happened where no mud sills have been used.



If the bungalow is set on posts, a necessary effect to obtain for appearance sake is to tie the building to the ground, as it looks rather awkward to see a house stuck up in the air on a few stilts. The most common way to do this is to put lattice work all around the building, or, what is in most cases preferable, is to tie the building to the ground by means of shrubbery, that is, plant all around the house. This adds the touch of nature that is necessary to complete a bungalow.

On top of the posts or foundation the sill is placed. This consists usually of a 4 x 6 timber running the entire length of the building. Also one of the same size down the middle to serve as a girder. These should be in a continuous length, or if it is necessary to join them it should be done by a half joint.



"WE WON"
To Give the Boys Healthy Outdoor Exercise Is Another Reason Why Parents Will Invest In a Summer Home

On top of the sills and girders the 2 x 6" or 2 x 8" joists are placed, and over this the floor, the floor to extend out to the end of the joist. On top of the floor all around a 2 x 4 piece is laid as a sill for the studs. These studs continue to the full height of the ceiling required, usually about 8 foot, and on the top of this is placed a 4 x 4, or as is usually done, two 2 x 4. This serves as a plate on which the rafters rest. The rafters are placed 2 feet on center. The ridge at the junction of the two sets of rafters finishes the framing of the building. The outside of these vertical studs are covered with some form of sheating, depending upon what the owner desires. The material mostly used is called novelty siding. This is simply nailed to the studs. There are other different ways of fixing the outside and this will depend entirely on individual taste. If a shingled outside is desired the studs may be

Plan of Log Cabin

A Log Cabin for the Woods Is the Ideal Summer Home

Digitized by Google

Stucco and Bevel Siding in Combination

Designs by Minter Homes Co. Bevel Siding Used to Advantage

covered with rough sheathing boards or with shingle lath just about 6" on center. If a stucco exterior is desired the building may be rough sheathed, the same as for shingling, then covered with a tar paper and metal lath attached, and the stucco applied to that, or perhaps Bishopric board can be applied or Bykirt lath and stucco applied to that. The latter two methods give an interior wall surface that needs no further treatment and is a cheaper form to put up for a stucco exterior.

In using novelty siding all the interior studs, etc., are all to be of dressed timbers. The idea of this is that the whole interior of the bungalow is of exposed wood which can be stained some color to suit the owner. This makes a very neat appearance from the inside and is the one mostly adopted.

Log cabins, etc., all come under the head of summer bungalows. Of course, a good deal of taste can be displayed in their erection. Perhaps the simplest method is to use slabs as sheathing so as to give a regular log effect and still preserve a smooth interior. This is by far the cheaper way of producing a log cabin effect.

In regard to the roof the rafters in most cases should be sheathed with ⅞" boards as this gives a neat finish from the inside. This should always be done where the room is to be left open. Over this sheathing board any roofing that the owner desires is placed. A rubber composition or canvas roofing can be placed over same and going up a little in expense is the chip slate roofing which is now being largely used in roll or shingle form.

In shingles there are quite a number of different varieties, there is composition, ordinary wood shingles, metal shingles, not to mention asbestos, slate or tile which are in most cases too heavy for the summer bungalow.

If shingles are to be used for covering the roof they may be placed on 1 x 2 inch shingle lath but this will not look as well from the inside if that is to be left all open to the rafters, it is far better to use the sheathing board which should be laid smooth side down.

Sheets of asbestos can also be used as sheathing; simply nail them to the studs and cover the cracks with thin strips of asbestos or wood lath or if an English half timbered effect is desired cover it with vertical strips.

In regard to the floor; a single floor is all that is required for the summer but if the house is to be used in cold weather we advise a double floor with tar paper between. One important thing about a camp is to be sure to have a good dry floor; a double floor gives it.

Bulk headed porches seem to be mostly in favor as they are more easily screened and serve better as outdoor sleeping rooms. One important point in the summer bungalow is plenty of windows. Quite often these are casement so that the full opening can be had in order to get a maximum amount of fresh air.

Picture to Your Prospective Customer the Joys of Having a Home in the Woods by the Side of the Lake—Fishing, Rowing, Swimming, Hunting

These summer bungalows are seldom erected where there is a sewerage system. Therefore, a cesspool is a necessity if water closet and bathroom are to be installed in the house. If one wishes to forego this expense a chemical closet can be installed and a small dry well used to take care of the waste from the kitchen sink.

The water supply is rather an important item. Where there is running water, of course, there is no trouble but if a shallow well has to be driven particular pains should be taken in the location of the cesspool to avoid contamination.

The exterior of the bungalow may be painted with some pleasing colors and can be made very attractive if a little judgment is used in the design. There is absolutely no need to have the neighborhood disgraced with a miserable-looking shack. It does not cost any more to get a well proportioned building that will be an ornament to the landscape instead of a blot. A neat fence with entrance gate and arbor, etc., adds to the attractiveness of the place.

Builders would do well to have ideas to offer the owners of summer homes. It is seldom that they go to an architect for a plan of such structure and it is up to the builder to supply it. It is good business to build an attractive bungalow of this sort because prospective residents will see some bungalow that they like and they usually ask the name of the builder. It is a case of one job being the recommendation for another. Many a carpenter has started in the contracting business by putting up these small summer homes and by giving satisfaction has built up quite a lucrative business of this specialty.

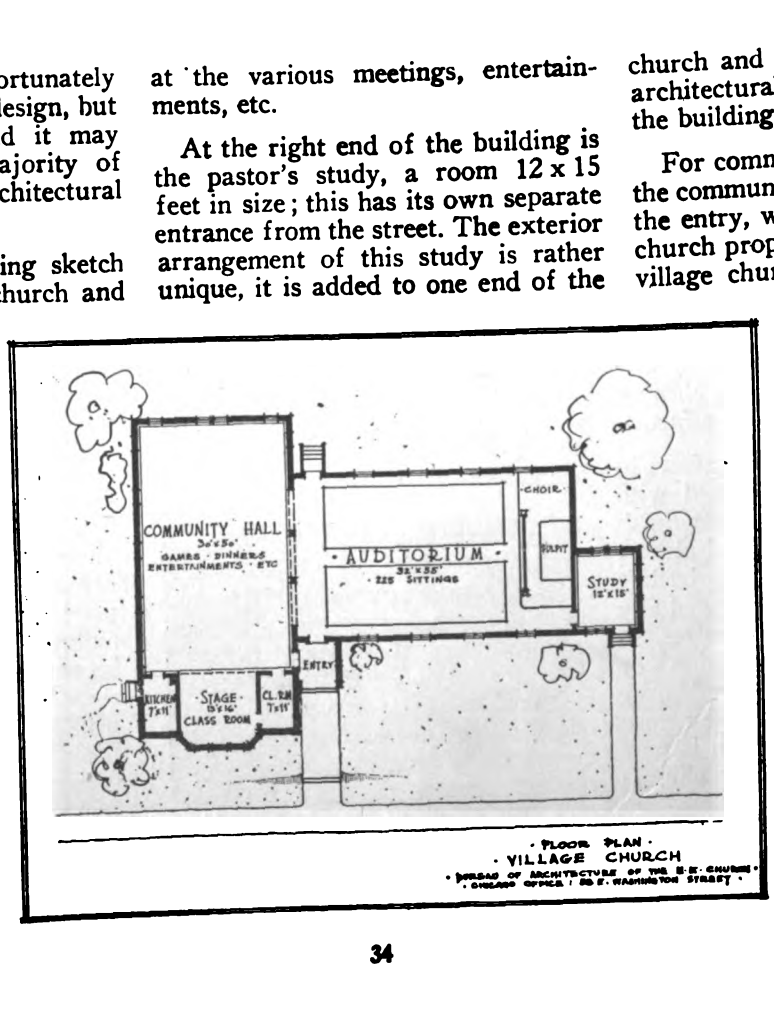
A Wood Church, English in Character

Designed by RALPH E. MILMAN, Architect

MANY churches unfortunately lack good artistic design, but on the other hand it may truly be said that the majority of churches are noted architectural features of their locality.



Here is a very interesting sketch and plan of a combined church and community hall. The church proper is a structure 32′ x 55′ in size, affording seats for about 225 worshippers. Additional seating capacity can be had by opening the folding doors leading to the community hall.

This community hall is equipped with a small stage, which, when not serving this purpose, can be used as a Sunday School class room. Adjoining it is a smaller room which serves as a cloak room. Opposite is a kitchen for the serving of refreshments at the various meetings, entertainments, etc.

At the right end of the building is the pastor's study, a room 12 x 15 feet in size; this has its own separate entrance from the street. The exterior arrangement of this study is rather unique, it is added to one end of the church and forms a very interesting architectural feature of this part of the building.

For community meetings, access to the community hall is had direct from the entry, without going through the church proper. This is a design of a village church recommended by the Methodist Episcopal Church Bureau of Architecture. It is a design which was planned for a clapboard or shingle exterior, although it would look equally as well in stucco, either on frame or hollow tile or even of masonry construction.

The large English bay window is an outstanding feature of the community hall end, the slope of its roof is in line with the slope of the main roof. A minaret or small steeple adds to the attractiveness of the design.

Standardization in the Building Industry

By JOHN M. GRIES,
Chief, Division of Building and Housing, U. S. Dept. of Commerce

THE building industry has passed through the youthful stage in which it wanted to try something new every day. With the development of various lines of industry, it was most natural that the experiments would be numerous and the variety of products almost endless. This period in the construction industry has largely passed. There was a time when the producer of materials wanted to make something different from that made by his competitor; to make something distinctive, and he attempted to supply the needs of all customers regardless of the difficulties in producing the article.

Style Goods Versus Staples

A little later the construction industry seemed to have followed in the footsteps of the producers of style goods. Later, however, the builder found that his line of merchandise could be called a staple in a large degree and not style goods.

Better Understanding Among Groups

As long as the building industry did not recognize its component parts, as long as each group attempted to go its own sweet way, as long as the architect, engineer, contractor, building material producer and building material dealer failed to recognize that he was only a part of a larger industry—the construction industry—a semi-chaotic condition existed, but now when they have begun to see more clearly that they all have many interests in common, that conditions favoring active construction favor all, and that a sound construction industry is of the highest public interest, the situation is improving.

Lack of Standardization

It is often said that there is little standardization in the building industry. By this some refer to the design of the buildings, others to the parts out of which the building is constructed, and others to building practice. It is not strange that there are many points of view, for the materials used are numerous and the product differs widely.

The product may be a one-room house, or a forty-room house; a one-family house or a one hundred-family apartment; a business building or a factory. This may be true, but there are thousands of each of these types.

Much of the material in a house is not visible and need not be considered insofar as beauty is concerned. That there should be different designs for houses, all will admit, but this does not mean that no two houses should use the same dimensions or the same materials.

Types of Buildings Considered

While buildings include many kinds of structures, I shall confine my remarks to residential, business and industrial buildings. Here the product is not standardized, and I may say that there never should be a single type for each group. We probably never will have as few designs or models of houses as we now have of automobiles. While we may have houses of a thousand different designs built of a thousand different materials or parts, of different quality or dimensions, standards are found everywhere.

Tendency to Eliminate Varieties

Much has been accomplished. That there is great room for simplification and more standardization is evident to all of those who have started to simplify or eliminate varieties of construction materials. The progress that has been made is most remarkable in some lines, and in every line of building materials some steps have been taken to reduce the number of sizes of the finished products.

Standardization of Materials

Standards of quality are often questions of physics or chemistry which may require long investigation, but certain problems of dimensional standardization promise early results and need not interfere with the necessary variation in design or style. There are entirely too many different sizes and grades of many of our materials. The tendency is towards fewer but the progress is slow. Considering various building materials, we find that lumber cannot be standardized as can steel. First, we have many different species of trees. Many are well adapted for the same purpose and they must compete with each other. They give room for a difference in texture, color, grain, as well as strength. We do not care whether they be soft woods or hard woods, pine, hemlock, or fir; oak, maple, or gum. Still all the species are used in building, and in certain directions there is little chance for standardization. There is, and there should be, greater standardization of sizes and grades.

Some people do not seem to understand the lumber business. They talk as if we had the knotless pine something like the seedless raisin or orange. They seem to feel that you can cut lumber into any shape or size as you can roll steel. There is a limit to the standardization that can well be effected in lumber. Trees do not grow so that you can get a certain number of logs of a single length out of each tree. There necessarily will be different lengths and different grades, dependent largely upon defects. Much standardization has been effected in the past and there is room for more, but the layman's idea of standardization in this field is, as a rule, very crude.

Cut Stone

Cut stone, for example, may vary in size. While the number of sizes may well be reduced, there should not be a single size. A product like stone, which is expensive to work on the job, should be standardized as much as possible and cut at the quarry. If the sizes could be arranged in simple series and rooms or buildings designed with reference to these sizes, there could be a great saving of work on the job. It is often said that products such as stone, brick and tile should be standardized first, since they are most difficult to work to size after they leave the plant.

Sizes of Brick

Some say that we cannot reduce the number of sizes of parts. Look at common brick. Here we have few sizes. Although there is much difference in quality, the sizes are few and dimensional standardization has been advantageous. While standardization of face brick can never be carried so far as in common brick,

Digitized by Google

the present efforts of the industry towards elimination of odd sizes should be encouraged.

Window Sash

The number of styles and sizes of window sash now used is very large. Comparatively few styles or sizes are needed in the building of small houses. The wholesale sash and door dealer often advertises more than 400 different styles and sizes. It would probably accrue to the advantage of the producer, the vendor, the builder and the public if there were a much wider use of a relatively small number of sizes.

Window Glass

If there any need for 100 or 150 sizes of single strength window glass, and approximately the same number of sizes of double strength glass? Are all of these sizes necessary to satisfy the artistic sense of our people? They are not.

Structural Slate

It has been the custom in the structural slate industry for the quarryman to prepare the structural slate in accordance with the orders he receives. The architect and builder specify the sizes. Here we have another instance of production to order which does not permit the quarryman to produce for stock, for neither the size nor the design is known in advance.

Time for Elimination

It is possible that a smaller number of sizes of pipes, drain tile, hollow building tile, glazed tile, the fittings, doors, locks, and other items of hardware, be produced. Just how far it is advisable or advantageous to go in the direction of the elimination of variety, I am unable to say, and I believe few manufacturers or builders are now in a position to answer the question.

Standards of Work

One of the serious problems of builders is that of estimating the amount of labor required to do a given piece of work. Knowing the cost per unit of material it is easy to compute the building cost from the bill of materials, but it is not so easy to compute the probable labor cost from a knowledge of the wage scale. How can a builder figure on the cost of construction without knowing what the labor cost will be? While some of you have done construction work of a certain kind for years from which you have evolved a more or less crude experience table, a rough standard, you are not in a position to estimate the labor cost easily on a new kind of work. You are often compelled to do some guessing.

How many hours will it take, or should it take, to lay 100 square feet of flooring? If the flooring is 2¼" wide, the cost will be different from what it will be if the flooring is 3¼" wide. The cost will differ somewhat if, in one case it is laid on a sub-floor and if in another case it is nailed to the joists. How long should it take to lay 100 square feet of flooring in a six-room bungalow? An office building? An apartment house? Will it take on hour? One and one-half hours? Two hours? or how long will it take the average workman to lay 100 square feet of flooring of a specified size or kind in a specified type of building? This merely illustrates the problem. What is the experience of the best builders? You may know your own records but how do you know that your gauge is all that can be expected?

Laying of Brick

There are few accepted standards of work. Occasionally a builder says that the average bricklayer should lay one thousand or fifteen hundred bricks per day, but what does he mean? One man is talking about summer, another about winter. One is talking about the laying of common brick in a small house, and another is talking about laying brick in an office building.

Some contractors have made time studies and know approximately the number of brick a good workman should lay in eight hours for different types of wall and under different conditions, but the great majority operate on guesses only.

Standards of work should be determined for many different operations. We should know more about the laying of hollow tile, the work of the tile setter, the time required for performing certain units in framing, roofing and siding.

We can not establish standards for work as long as the builder fails to schedule his work. One of the first essentials is to have materials on hand. If the management fails to order the work properly, if it makes the carpenter wait for the framing, if it makes him walk 100 feet to get the studding, you can neither expect results nor establish standards in which both an employer and employee will have confidence.

A Common Language

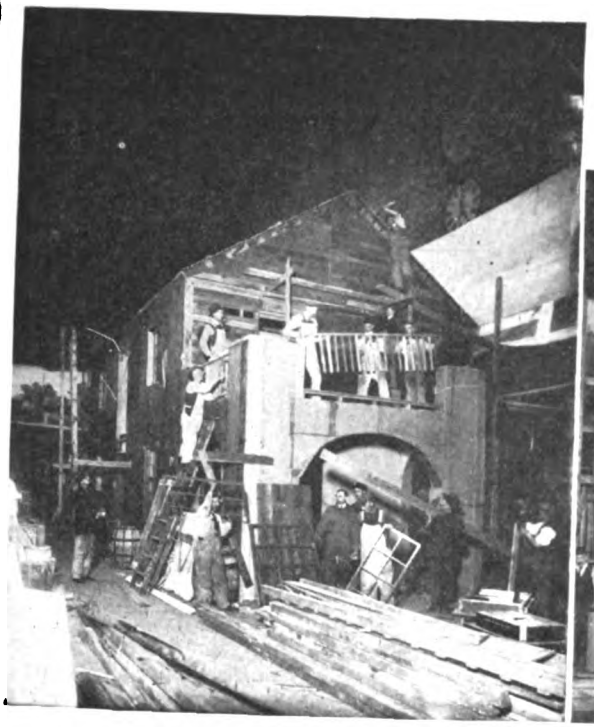
With the closer cooperation of every element in the construction industry, we will soon speak the same language. We must accept a common terminology. Furthermore, cost accounting must be more uniform than it is today. What two producers, what two vendors, or what two contractors have the same definitions for ledger accounts? Many will say that all agree. You think the other fellow uses your terms and he in turn thinks that you use his. I have examined many sets of books and found that even among those who claim to have the same system that the definitions of accounts differ.

Cost Accounting

When contractors compare costs with each other, I become skeptical. Why? Because I have often found that the definitions of labor accounts vary widely, that contractors are talking about entirely different things. The account may bear the same name but the expenditures charged to the account are not the same. I have seen trucks charged to a single job or to the month's expenses, while others have charged it to equipment.

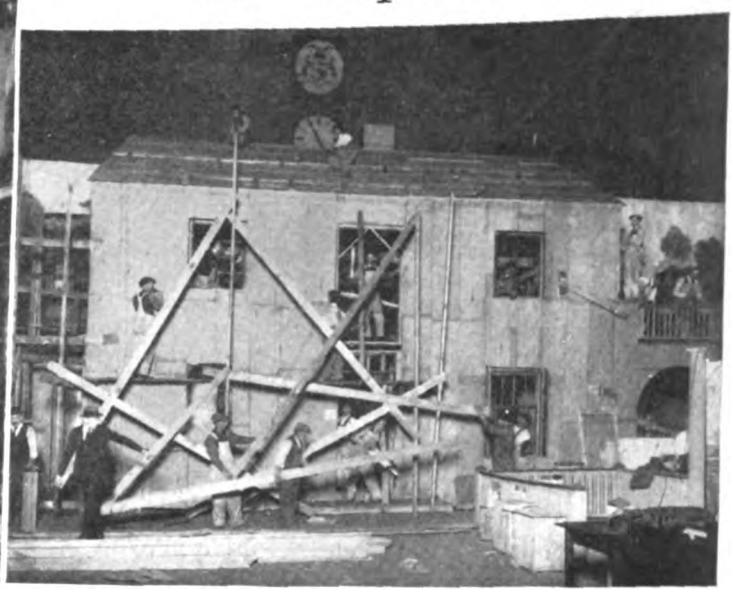
Forms of Contract

Why should not contract forms be more nearly standardized? If good contract forms are adopted much less time need be devoted to the study of the contracts. Litigation will be less common. There will be less misunderstanding and a better spirit exist.



All Are Interested in Simplification

To reduce the number of varieties is one way of eliminating waste, of producing at lower cost and increasing the amount of building and home ownership. And the owner of the building when completed will find it much less economical not to be able to buy standard stocks in maintaining the structure.



The construction industry is making great progress. One of the greatest advancements made recently is the recognition of the fact that it is one of the great industries and that the individual parts or groups realize that they are a part of that industry and that cooperation is necessary to insure progress and obtain the benefits of economies made possible only through cooperation.

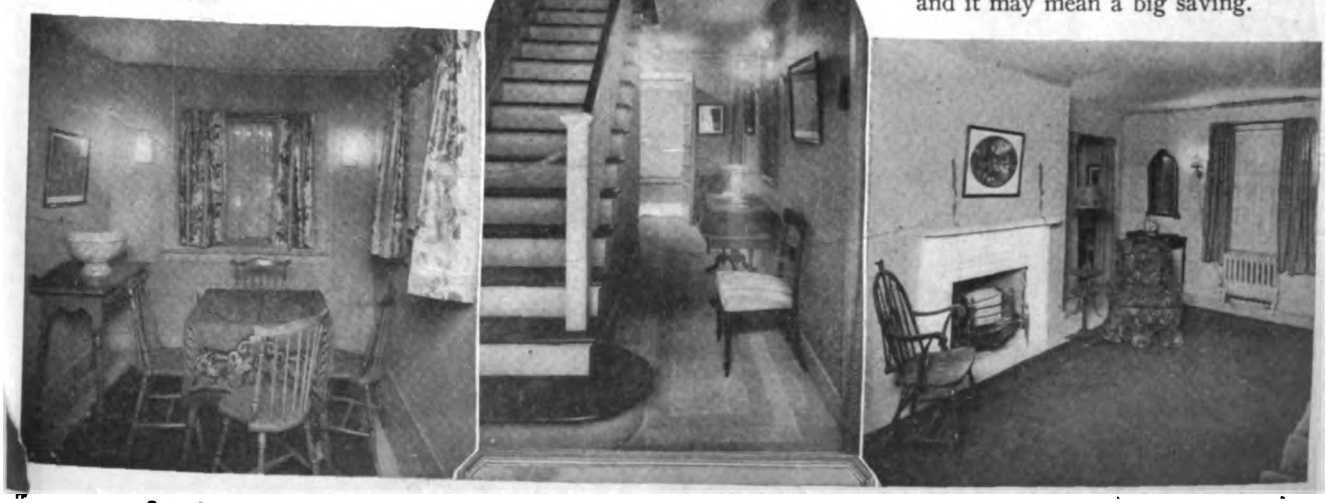
Rapid Construction for Exposition

Wednesday

Thursday

trim for the front entrance door with the ornamental window and balcony above were all set in place and the finished coat of stucco started.



While the outside work was going on the inside was being wired for electricity both for lights and appliance outlets. Wall board was applied to the studs and joists, the stairway installed, the floors covered with a special rubber tiling, plumbing fixtures set in place, etc.

Saturday morning the house was cleaned out and the outside scaffolding removed, and rubbish cleaned away, and the finishing touches applied to the exterior trim.

Then the house was given over to the furnishers who placed the furniture, hung the draperies, pictures, etc., in fact made it a home. At 3 P. M. it was ready and opened to the inspection of the public.

The construction work was carried on under the direction of the architect, Dwight James Baum. The erection was the work of the Lewis Lumber & Supply Co., of New York, and too much credit cannot be given them for doing a really creditable piece of work in a very short time. It seems a pity that such a complete little home was not up for keeps but it served its purpose by being a very interesting feature in an interesting and successful exposition of home building.

The same principle of construction that made for the rapid erection of this building could be applied to reguler field construction. Framing can all be cut and fitted together at the shop and spiked in place just as was done in the erection of this building and it may mean a big saving.

Shop Framed Houses

How to Save Labor and Material by Fabricating and Assembling the Framing Sections at the Mill

By A. H. SCOTT

THE idea of the ready-cut or ready-framed house is nothing new, but under the limitations and handicaps with which builders have had to work during the past few years the production of such houses has been given an impetus which has produced many economies. Close attention has been given to cutting down every possible item which would affect cost of production, and equally close study has been made to reduce the amount of labor which must necessarily be performed when the parts for such a house reach the site where the house is to be erected.

The results of all this study and effort are of interest to builders and contractors everywhere, for under pressure of the shortage of houses and the high cost of building it well behooves the builder to keep thoroughly abreast of the constantly improving methods by which ready-framed or ready-cut houses are produced and erected.

"Homes, Not Houses," is the slogan of Mrs. Kate E. Wilder, the originator of Wilder's Ready-Framed Houses, and anyone who has inspected one of the buildings erected by this woman architect and builder will readily agree that it is all that the term applies. Mrs. Wilder got her idea of brace framing in sections from our New England forefathers, whose method was to frame the structure in sections flat upon the ground, and when all was ready to call the countryside to the "house-raising." From 30 to 50 husky men usually attended these affairs and it was quite usual, with the aid of a convenient cask of cider, to not only raise and roof over the house, but to completely sheath it in one day.

Mrs. Wilder's method of fabricating and assembling the framing sections at the mill is a distinct advance over the original method and over

Digitized by Google

The Fabricated Frames Ready to Be Raised

that of the so-called ready-cut house, in which much time is lost in sorting over the various parts. The lumber, North Carolina pine, is first dressed on all four sides and then cut according to drawing, in sets of five, as this is the minimum number of any design which it has been found economical to fabricate at any one time.

To prepare material for five houses requires only 70 working hours at the mill, all the sawing for five duplicate houses being done by one man, who has to make but one reference to the drawings for each set of five of any one part. These parts are piled in sets of five and move forward to the assemblers, who nail the framing materials together and number the sections thus formed. The diagonal bracing is all cut from material which would ordinarily go to waste if the lumber were hand-sawed on the premises.

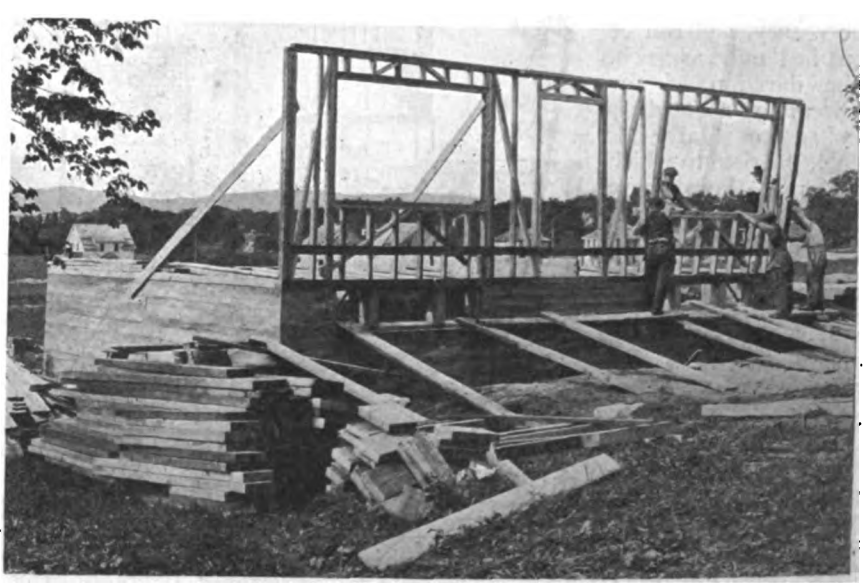
To take a specific instance, many piazzas are 7 feet wide—an odd width, which results in much waste of material. Mrs. Wilder makes her piazzas 8 feet wide and uses the 4 feet left over from 12 foot studding to make two 2-foot braces. This diagonal bracing, which is also used between studding in partitions, holds every stud firmly in place, resulting in a wall that will not crack and a house that cannot sag.

The sections are made to fit perfectly, being just the proper sizes to load well on a flat car, one car usually being sufficient to carry the framing and other rough material for a house.

All sills are tarred and bolted to the foundations, the floor joists being set on 16-inch centers and well spiked to the sill and upright stud. A solid line of bridging is set, and all rough flooring laid diagonally.

The old style lock corner and brace is used and makes the building so firm and rigid that old Dame Nature is unable to rack it. These braces also safeguard the plaster from cracking, for when a house is balloon-framed straight up and down and when the inevitable shrinkage comes, something has got to give—the lath pulls from the studding and cracks the plastering.

The accompanying illustrations show various stages in the erection of one of these houses, the actual time of raising all four sides of the first story being 38 minutes, and it was only necessary to remove ⅛ inch from the lower end of one section to make a perfect fit—eloquent testimony to the accuracy of the work.



The same exceptional care is used "from the ground up" in Wilder's houses; an 18-inch footing of 3 to 1 concrete mixture is provided to insure an absolutely firm foundation and to eliminate any possibility of the setting of cellar walls and the consequent sagging of the whole structure.

Timbering is never shaded below what is standard practice. Girders are 6 x 8 long leaf yellow pine; joists first and second tiers 2 x 8 on 16-inch centers, third tier 2 x 6 on 16-inch centers; roof rafters 2 x 6 on 24-inch centers, and 2 x 4 studding. Sills are 6 x 8, tar coated on all sides and imbedded in a rich concrete mixture. Half-inch bolts are set in the foundation every 6 feet, anchoring the sills and the whole structure firmly to it.

The cellar windows are all set in concrete and well packed with 3-ply building paper on all four sides.

If there is an overhung bay window or bedroom which extends out over the line of underpinning or piazza, unusual precautions are taken to prevent the entrance of draughts, the bedroom floors being protected with 3-ply waterproof paper over which is laid wire lath, followed by a scratch coat of cement.

This effectively prevents the entrance of wind and also allows for any shrinkage. The deck under the bay window is protected with canvas decking, properly shrunk with salt water and filled with white lead, followed by several coats of oil. As a further precaution, this space is filled in with broken tile over which cement is poured.

Apartments for 1,600 Families

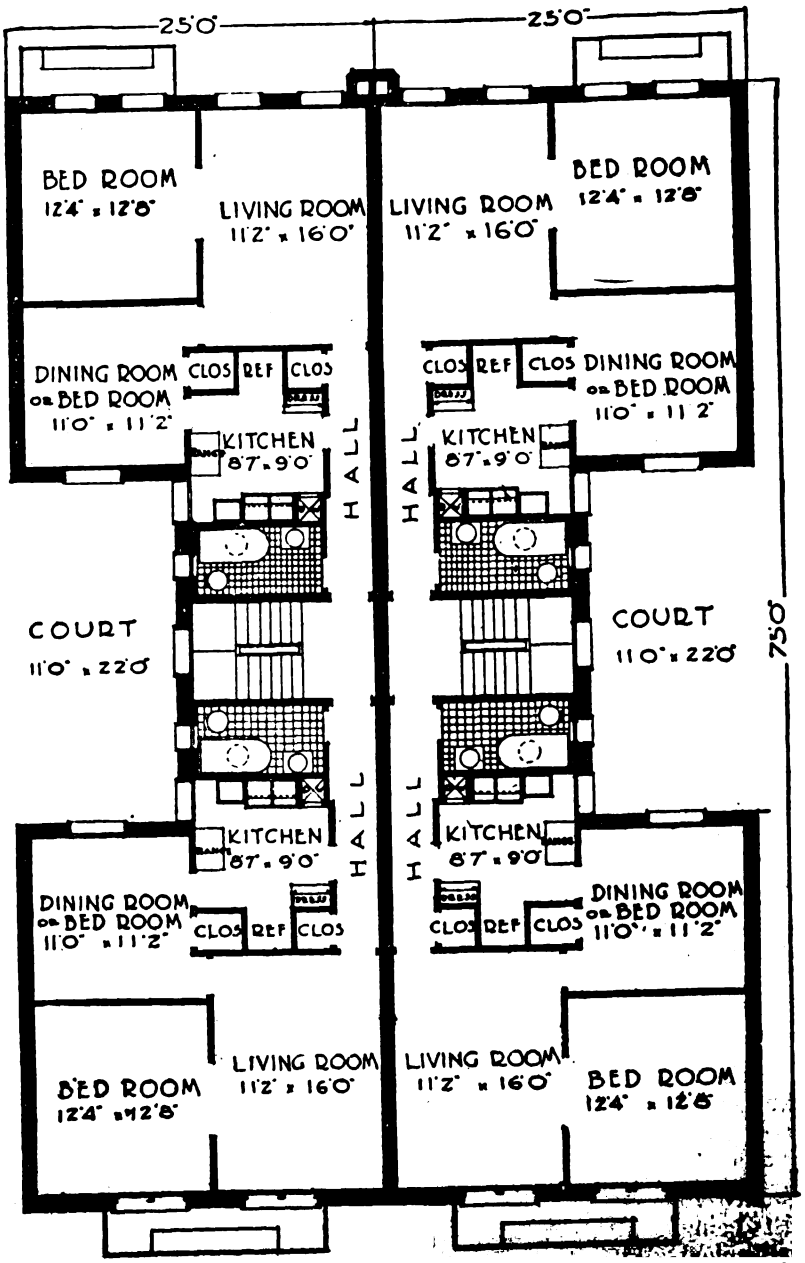
The Mammoth Building Project of the Metropolitan Life Insurance Company $100,000,000, to Be Invested in the City of New York

ON April 14, the Governor of New York signed the bill which enables the Metropolitan Life Insurance Co. to invest some of its funds in housing construction. Previous to this as described in the last few issues of the BUILDING AGE and THE BUILDERS' JOURNAL, this insurance company was able to help building along by advancing large sums to different loaning companies who acted as their agents. No loans were made direct.

In approving the Metropolitan bill the Governor said that it was a temporary measure only, to relieve an emergency, and could be justified only as such. The Governor reiterated today previous statements that he had serious doubts about the wisdom of the bill, but said he yielded to the belief that there was little danger of any harm from the measure and much hope of real relief. In a memorandum he said:

"This is a temporary measure to relieve an emergency, and can be justified only as such. The duration of the powers granted is limited to March 1, 1924, the date to which the rent laws have been extended, or to the duration of the present housing emergency, which must be construed to mean until March 1, 1924, unless the Legislature shall further extend the emergency laws.

"At least one company proposes to take advantage of the act, and has already prepared plans which it is prepared to put into immediate execution. It proposes to erect sanitary, well ventilated tenements to rent for $9 per month per room or less. Its estimates, based on actual market conditions and labor costs, without taking into account possible concessions, indicate that at a less rental than that prescribed by the act, the investment will yield a 6 per cent return after allowing for depreciation and a sufficient amortization during the tax exempt period to offset a possible decline in prices.



"Proper housing so vitally affects the health of the community as to be a matter of pecuniary interest to insurance companies."

Type of Houses Selected

The building program of the Metropolitan Life Insurance Company will be started immediately with the erection of fifty houses, accommodating thirty-two families each, in Long Island City and Astoria. Walter H. Stabler, Controller of the Metropolitan, said tentative plans for the apartment houses have already been drawn, and the company is ready to buy sites after selections have been made from a number of pieces of property offered.

Andrew J. Thomas, who has been engaged by the Metropolitan as architect for the new apartments, has commenced work on the detailed plans. C. Everett Waid, architect for the company, will cooperate with him. Mr. Stabler said that the architects' forces would work night and day to rush the plans to completion and that he expected that they would be ready within ten days or two weeks. We show a floor plan of an apartment project recently designed by Mr. Thomas.

The type of house that has been chosen is a four-story structure with three, four and five room apartments with baths. All the houses are to be steam heated and will be without interior courts. "Mr. Thomas's plan is an excellent one," said Mr. Stabler. "Everything is very simple.

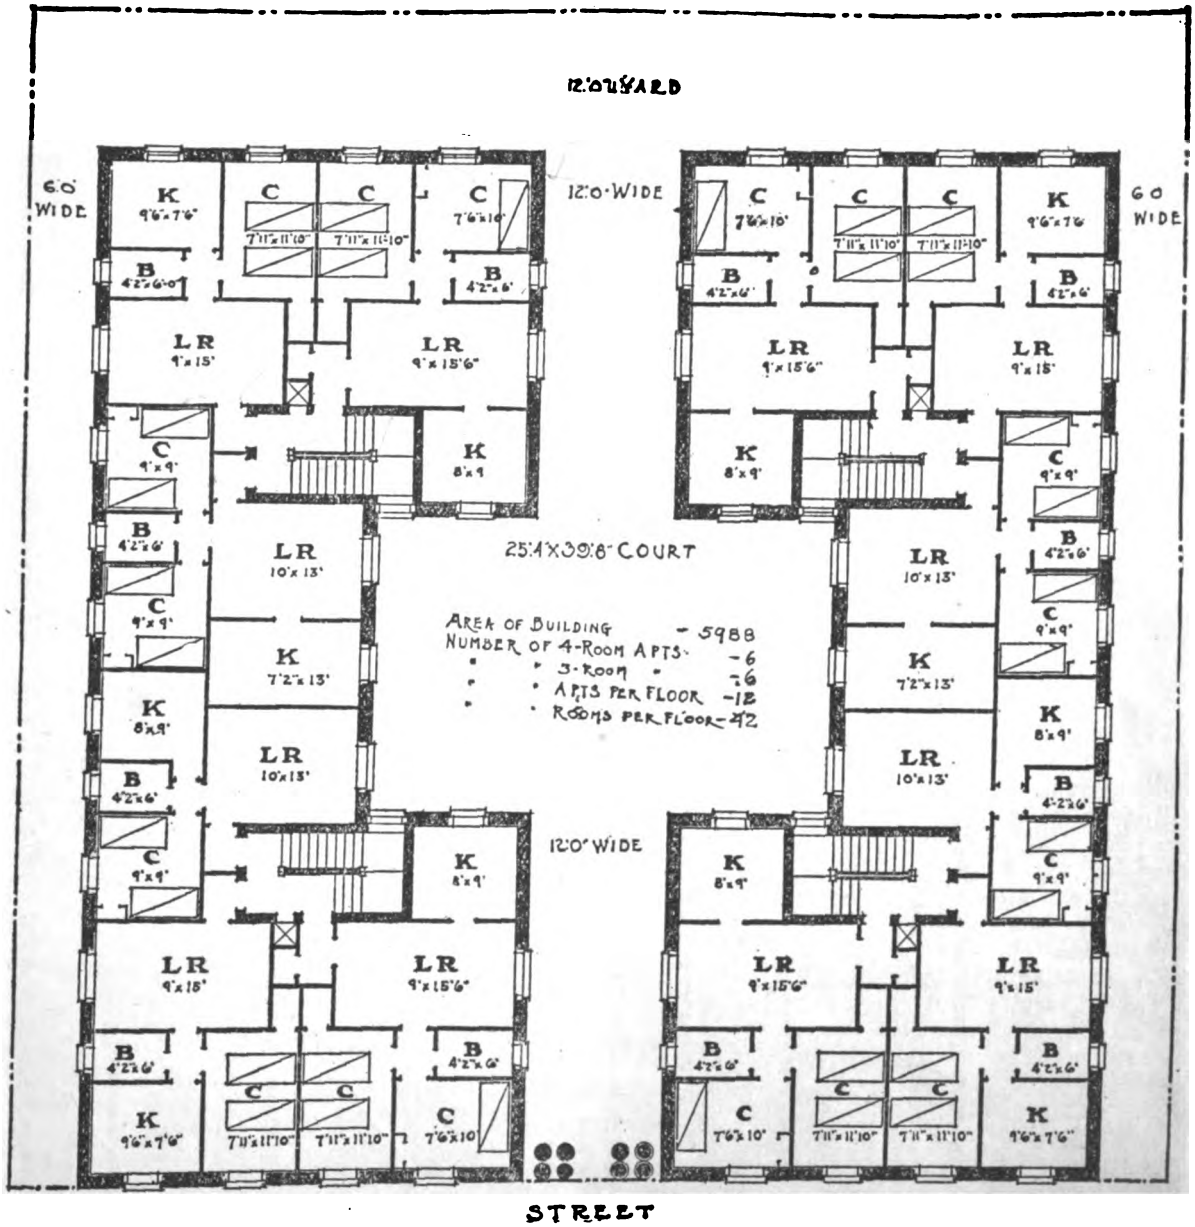
Typical Floor Plan of the 68 Apartment Houses to Be Erected in Norwood Gardens, Long Island City, by Bernard M. Maltz

Digitized by Google

There are no fancy fixtures, but the houses will be good, wholesome places for people to live. All of them will be comfortable and well ventilated."

The houses will be erected in blocks, and it is expected that four whole blocks will be required for sites for the first fifty structures. Mr. Stabler said that all of the sites under consideration were close to good rapid transit facilities.

Taking Mr. Stabler's figures for the cost of the first fifty buildings in relation to the number of tenants they will accommodate, homes for 128,000 persons would be provided if the entire proposed $100,000,000 building program of the Metropolitan Company is carried out. The first step in the program, calling for the fifty houses, would provide homes for 1,600 families.



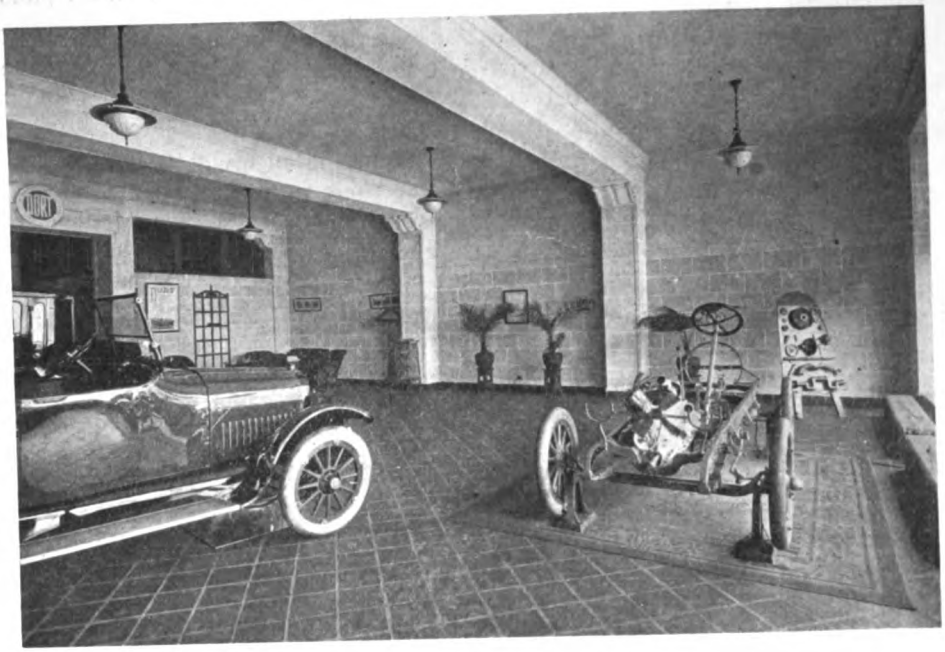
About six weeks ago, the Metropolitan Life Insurance approved loans amounting to $2,750,000 to build sixty-eight, six-family apartment houses, forty-eight two-family houses and 250 one-family houses in the Norwood Gardens and Arleigh sections of Long Island City, at a cost of more than $5,000,000, including the land.

These buildings, which will provide accommodations for approximately 800 families, or about 4,000 people.

Bernard M. Maltz, one of the largest builders in Brooklyn, will build sixty-eight six-family apartment houses, each 25 by 75 feet, on plots 25 by 100 feet.

Each building as shown on the floor plan shown here, will contain six four-room apartments.

The buildings will be thoroughly first class in construction in every respect, the fronts being of the best quality tapestry brick, with stone trim.



House With Open Court, Designed by Andrew J. Thomas. Plan Drawn to Prove That a Better and More Profitable Building Can Be Erected on 55 to 60 Per Cent. of a Lot Than on a Larger Percentage.

Window Glass and Its Glazing

By A. ASHMUN KELLY

TWO things are essential to a perfect job of sash glazing, properly primed sash and good putty. The sash that comes from the factory ready glazed is apt to part with its alleged putty sooner or later. Such sash is dipped in a thin mixture of rosin oil, to which putty will not adhere. The putty used is apt to be made from pulverized limestone and mineral or resin oil. Such putty will not stand up very long against the elements. For a good job it is better to have the glazing done on the premises, where it will have the proper attention.

The best primer for the sash is raw linseed oil with a little white lead and a very small quantity of driers. The essential ingredient is the oil. It must be pure raw linseed oil. If the sashes are to be finished au natural, then prime with the oil only, with a little japan drier. If the inside is to be finished natural and the outside painted, then prime the whole sash with clear oil only.

The purpose of the oil primer is, of course, to keep the wood from robbing the putty of its oil, which would weaken it. The white lead simply aids the oil in closing the pores of the wood. The factory plan is to use whiting in place of white lead in the priming, and that is not so good.

Directions for glazing need not be given, for the painter will attend to that. But here is a little wrinkle that all expert painters do not know; when done glazing a sash take the duster and dip it in clear cold water, and brush the glass off around the glazed parts, which will remove the grease. If this oily grease is left to dry on the glass it is almost as difficult to remove as paint.

It is always best to bed sash, though it is not usually done on small lights. This, because it very seldom occurs that glass is perfectly level on its flat side, hence does not lie flat against the wood. But to bed glass

Nothing looks much worse than the putty showing from the inside, against the glass; to prevent it don't let the putty come quite to the edge of the muntin, as seen below the glazing. So also, when tracing the sash, don't let the paint get beyond the muntin. Expert painters know what to do, but they sometimes require watching, to keep them right.

In fastening down the glass do not get the latter too tight against the wood, but allow for expansion, for glass sometimes breaks because sprigged too tight. The bevel side of the glass is placed to the outside, the flat side to the wood. Never cut the wood to make a glass fit, but rather cut the glass. If the light is short, fasten it at the top so that it cannot slide when being handled.

For quick jobs of sash priming and glazing, use raw linseed oil with plenty of driers and no white lead, or use boiled oil alone.

To bed small lights quickly, roll out some putty on a level board with a rolling pin, to any desired thickness, this depending upon size or thickness of glass, and take up the putty by pressing the edge of the glass against it.

To remove putty marks from ground glass, or glass with any sort of rough surface, to which the putty will stick, use a solution of lye, with a small swab. Some rub soap along the glass before glazing.

The question has been asked, should the sash in a front door be placed with putty inside or out? The carpenter seems to be the arbiter in this matter, but as a general thing such sashes look better with the putty showing outside, but there are some exceptions. The writer thinks, as a mere painter, that the sash and door will look better with the putty showing from the inside.

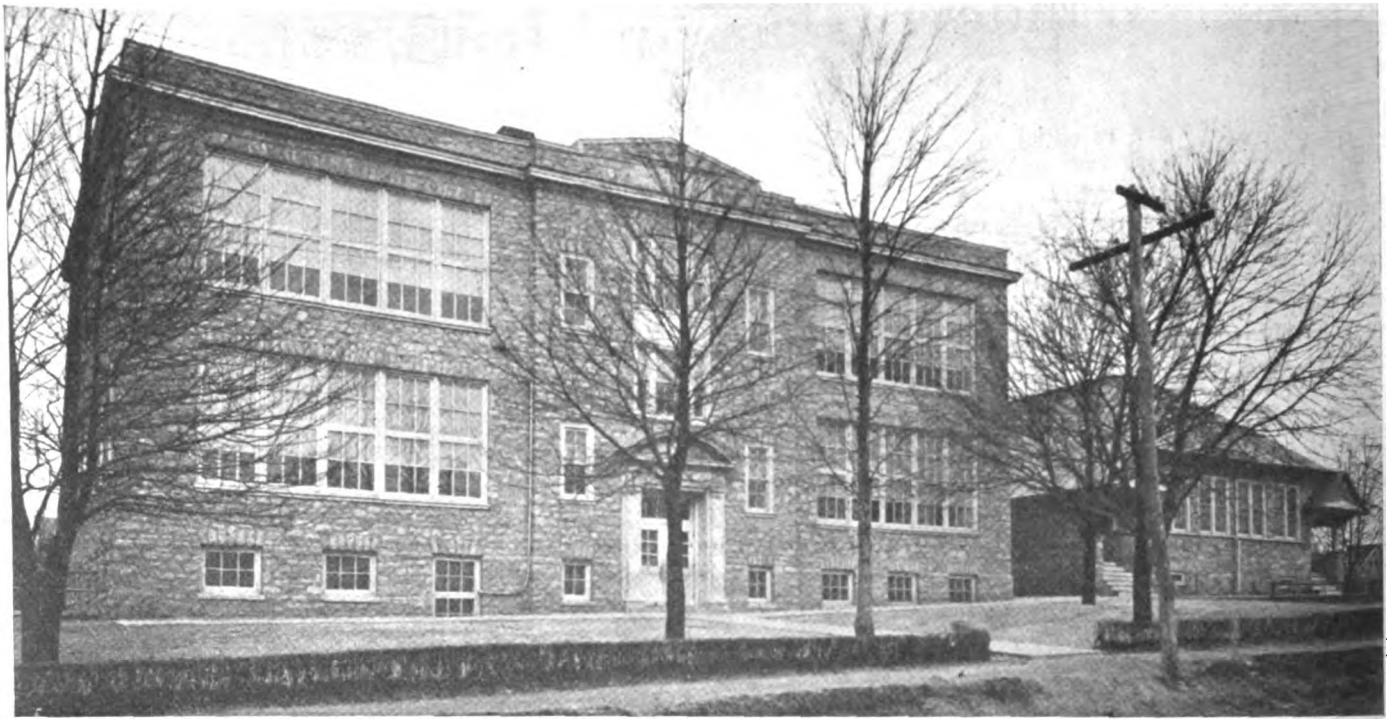
Plate Glass

USUALLY the specification for plate glass is for American glazing-quality, and if a better grade is desired then select the "silvering" quality. Or for the very best specify the "French silvering" quality. This is as fine a glass as probably can be made. It is nearly silver-white, whereas, the American shows a slightly greenish tinge. While the usual thickness of this glass is about one-fourth of an inch, yet it may be procured in any size or thickness for special purposes.

The only defects apt to be found in plate glass are bubbles, with an occasional gray spot, where the polishing has not been perfect.

There is a double-thick first quality American sheet glass that may be used in place of plate in many cases. It is a clear glass, with good weight and sufficient thickness for usual plate glass purposes. It is, of course, cheaper in price than regular plate glass.

The thickness of plate glass runs according to the size that it is necessary to use, and this according to the wind-stress, for which I have no figures at hand, and it is the architect's matter anyhow, and he has figures showing the facts in the case.



Even plate glass has considerable flexibility, and in large panes is strong enough to withstand great wind pressure, but that is not the only test that it must ordinarily undergo. One of the agencies it must be guarded against is the power of the sun, which expands and contracts it when subject to its full power. It is for this reason that it is not advisable to paint or letter too extensively on a plate glass window, owing to the unequal expansion and contraction of paint and glass. Many cases of broken plate glass windows have been reported from this peculiar cause.

Sheet Glass

AMERICAN single-thick window glass averages about 1/10 inch in thickness, and weighs about 18½ ounces per square foot. It is safe to use against ordinary wind pressure in sizes up to 30 x 40 inches. Double-thick glass, which is about 1/7 inch thick, requiring a counter-balance of 24½ ounces to the square foot, may be had in sizes up to such as will make the total sum 320 inches. That is to say, 60x60 inches, 40x80 inches, or anything within these limits. While double-strength glass may be used in place of plate, it is only in stationary lights and in protected situations.

It is hardly safe to use double-thick window glass above 40 x 44 inches in exposed positions or in movable sash.

Modern School

Interesting Design with Assembly Room in Separate Building

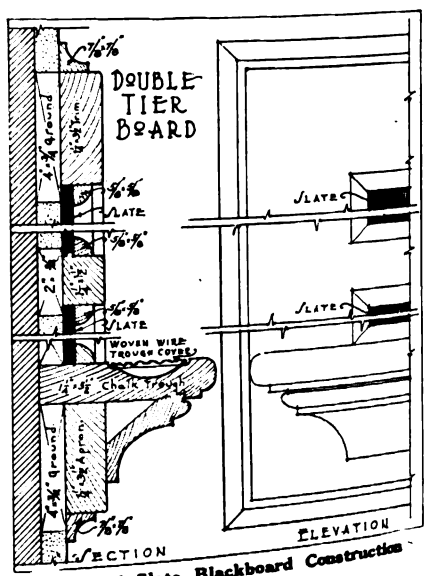
Designed by SCHERMERHORN & PHILLIPS, Architects

HERE is an interesting school which was erected at Fort Washington, Pa., for the Upper Dublin township, from plans prepared by Messrs. Schermerhorn & Phillips, architects, Philadelphia. The general contractor was William L. Hampton of Pottstown, Pa.

An old four-room building was remodeled into an auditorium, which was connected to the new building by means of a covered passageway. First two class rooms (Nos. 1 and 2) were erected. At this time a dry closet toilet system was installed of ample capacity for the completed building.

Slate Blackboard Installation

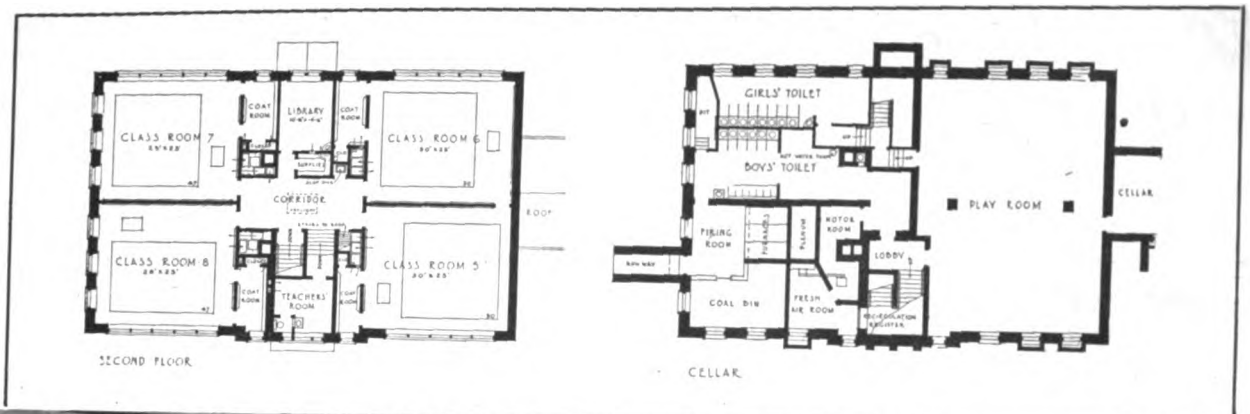
The main stairway is of reinforced concrete construction with side walls of glazed brick. Slop sinks are provided on each floor in a janitor's closet.



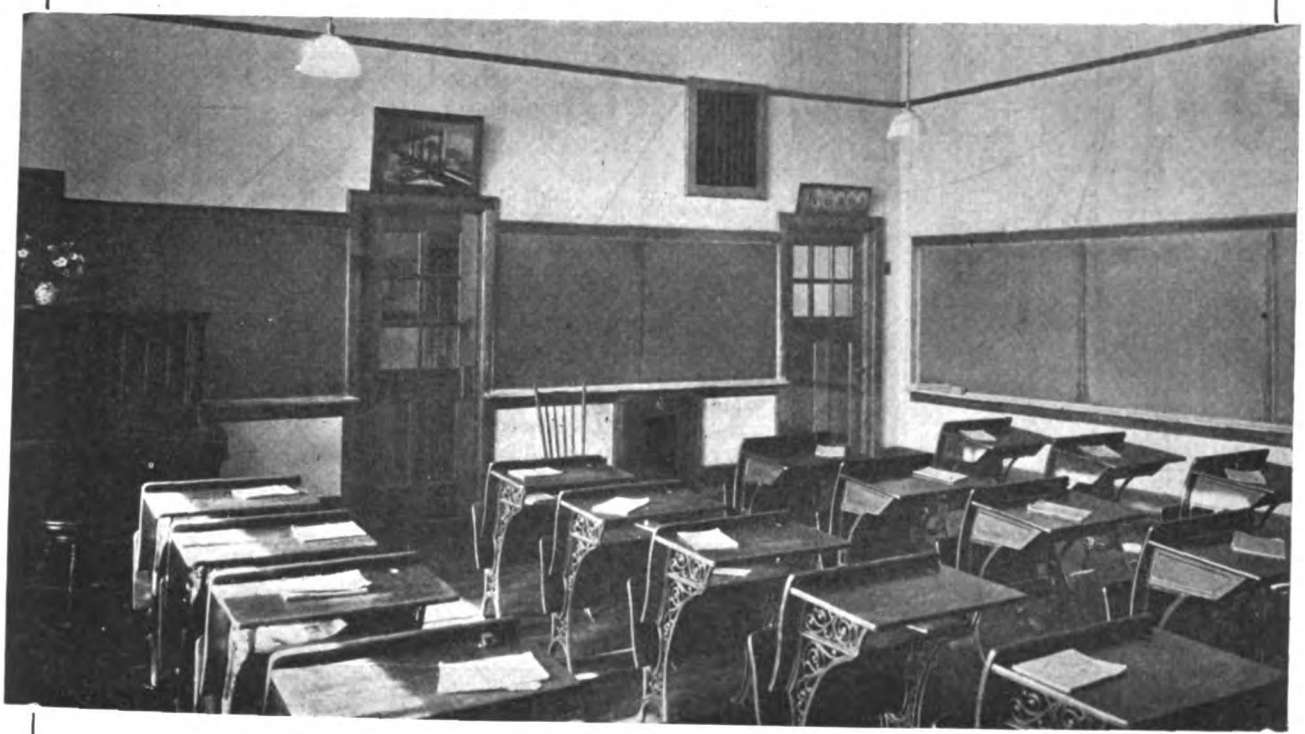
The library on the second floor is also used as a directors' room. The teachers' room over the main stairway contains, besides toilet facilities, a built-in medicine closet and electric heater receptacle which is used in making coffee, etc.

The building is built of local stone and is heated and ventilated by means of a fan furnace system.

Above the main entrance is the inscription *"Let the Spark of Learning Glow."* This inscription was selected from many submitted in a competition by the pupils of the school.



The picture on the opposite page shows an interesting view of class room No. 1. The other class rooms are laid out in a similar manner, blackboards are placed along the walls.



In regard to this subject, we give two details of good methods of erecting slate blackboards in school rooms. These details were kindly supplied us by Mr. D. Knickerbacker Boyd, Architect, Philadelphia, who has made a special study of the proper instllation of slate for the Structural Service Bureau of the slate producers.

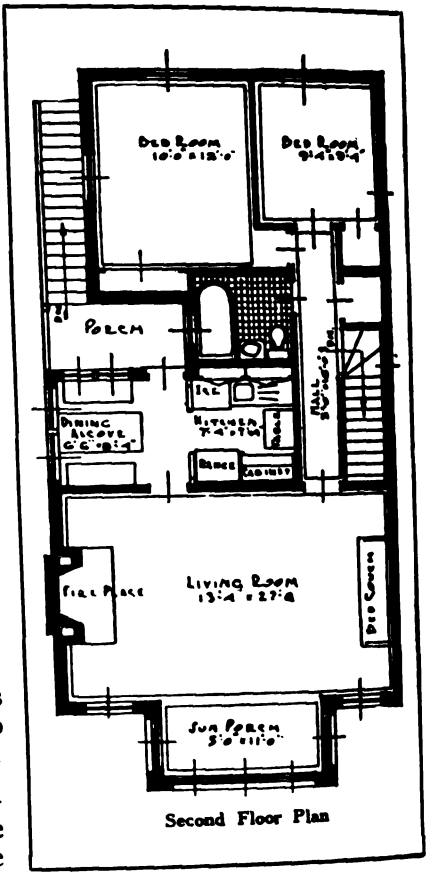
Two Family House Design

Erected Complete as an Exhibit at the Recent Own Your Home Exposition in Chicago

Plans prepared by HENRY K. HOLSMAN, Architect

First Floor Plan



stead of detracting from it as is so often the case in this particular type of a dwelling.

This house really consists of two very convenient five-room bungalows placed one over the other, each having a large living room with attached sun porch, two bedrooms entirely separated from the living rooms with adjacent bathroom, and a most conveniently arranged kitchen with a dining alcove which is exceptionally well lighted.

The kitchen is provided with plenty of storage room in the way of cupboards and closets.

This is an economical type of house to build because one basement, laundry, heating apparatus, one plumbing stack and the one roof serves both homes. It casts less than two separate homes and it makes a better investment, for in a great many cases rent from one home is sufficient to make the payments on the building.

The house was built on the Exposition floor as an object lesson to home builders. It was constructed of frame

Second Floor Plan

ONE of the interesting features of the recent Chicago Own-Your-Home Exposition was the complete two-family house shown as the principal exhibit.

The plans for this building were prepared by Henry K. Holsman, Architect, of Chicago, and the building was erected and built on the Exposition floor by the Holabird Construction Company also of Chicago.

The house as pictured here has the appearance and good proportions of a one-family dwelling of two stories. It has been so arranged that the back porch and back stairs add to the lines of beauty of the design in-

covered with stucco, with brick trimmings and had an asphalt shingle roof.

The design is somewhat along Spanish lines; a very artistic effect can be had by having the stucco tinted a cream, the brick a dark red, the trim of the windows, etc., a light green, with the balcony rail in black, this with a red Spanish tile roof either in metal or clay.

The plumbing arrangement cuts down the cost of the waste, and vent pipes and the labor of installing is therefore easier. All these little details have been considered so as to have the cost of construction reduced to the minimum.

Training Apprentices

Extracts from a Paper Submitted to the National Conference on Construction

By HUGH FRAYNE, of the A. F. of L.

I DO not believe there is any question as to the need of vocational or industrial training, or that there should be a sound and unified system of promoting it throughout the country.

We have advanced far in this connection and with the new condition that has come as a result of the world war, the need for highly and specially trained workers in industry is more apparent than ever before. This is not only necessary to meet the emergency of reconstruction now but it is a fundamental that applies to the social and economic life of the nation for all time.

It must be started by a group that will be representative, that will set forth a constructive program, and I think now is the time to decide upon organization and to start the work by the employers, the representatives of labor and the boards of education of the country formulating a definite program.

Recognizing the necessity of well trained mechanics in the various branches of the building trades, developed through a properly regulated apprenticeship system such as will give the boy the right kind of training that will make him a competent mechanic, able to give a fair minimum of service at all times, due consideration must be given to the fitness of the apprentice to take up or learn any given trade.

The responsibility of proper training rests upon the employers' associations and the unions, both in the selection and the development of apprentices. The building industry does not need more mechanics as much as it needs better mechanics.

WE believe that technical and industrial education of the workers in trades and industries, being a public necessity, should not be a private but a public function, conducted by the public, the expense involved at public cost and as a part of the public school system. In order to keep such schools in close touch with the trades and industries there should be local advisory boards including representatives of the industries, the employers and organized labor. I believe it is not impossible in many instances for a person to do much more work without extra physical strain through the proper training. There is a right and a wrong way to work. An experienced trained man can work as many hours as necessary without strain and do efficient work, whereas an untrained man, not knowing how, will work harder and accomplish less. This will apply to any worker who has not been properly trained in the handling and use of tools.

There is a right and a wrong way to sit on a chair or at a bench and work; a right and a wrong way to stand at a machine and to adjust it. All of these things have an important bearing upon the question of industrial training.

When properly worked out this systematizing tends to increase efficiency and production without causing extreme physical strain upon the worker. This extra production should always be recognized and the workers should share in it by an increased compensation.

THERE are many so-called trade schools in this country where they attempt to teach young men and women trades and parts of trades, and turn them out after a time, absolutely unfit to take their proper places in any of the trades or callings. They become dangerous competitors of the unions who have worked to establish themselves not only as skilled in their trades but to establish a high standard of living.

THE untrained worker is a liability on industry. The skilled worker is its greatest asset.

Skilled workers and trained mechanics are a nation's income, while the poorly, inefficiently trained workers are its deficit.

In many of the private trade schools employers train young men especially for their own industry and when that young man leaves that employment he is helpless to go out into the world because he is not competent to work as a skilled mechanic and command the wage rates and standards established by the unions.

As to what the American Federation of Labor is doing to promote vocational education, I believe I am safe in saying that its work up to the present is of a sound and constructive nature. We believe that the public schools should teach the theory of the trade while the actual practice and processes should be taught in the shops.

INSTRUCTIONS in a trade should be taught by an experienced, practical journeyman of the trade, with ability to impart knowledge. This method permits of continuous development of capacity and relieves the manufacturer of the expense of theoretical instruction and provides a means of weeding out boys who are not adapted to particular trades.

By this method the boy, the employer and the community are benefited. The obligation to provide industrial education of a theoretical nature, therefore, should rest entirely with the public schools.

It is generally agreed that the boys and girls of the present and future should be properly trained but that training should be of the right kind. The student should understand to not only work the materials but to learn all about the materials.

The hands and brain cannot be too highly developed. The student or apprentice should be developed to fit the trade, not the trade to fit the student. Higher skill developed in the mechanic means higher wages and better conditions, as well as a general benefit to the country.

The First Contract

Homes That Holm Built

Two Brick Houses

Interesting Story of How a Bricklayer's Apprentice Became a Successful Contractor Specializing in Home Building

STARTING in the building trade as a bricklayer's apprentice, and in a few short years becoming one of the leading home builders of Chicago sounds more like a good story in a magazine on success than the real tale of a business career in the building game.

Truth is often said to be stranger than fiction, but the truth about the success of T. A. Holm is not so strange when he tells it himself: Vision, hard work, and satisfying his customers sums it all up in a few words.

Mr. T. A. Holm is the head of T. A. Holm & Co., Builders and Realtors of Chicago, and they have over 500 houses to their credit in about nine years of operation—almost one a week!—a record to be proud of.

T. A. Holm was born in Copenhagen, Denmark, on August 17, 1880. His early education was in the elementary schools, with two years spent in high school.

Coming to this country when a lad, he began work as a bricklayer's helper, and later became a full-fledged bricklayer. He spent his spare time in studying the building business, practising drafting, reading books and magazines, and spending two years in a night course at a technical high school.

He kept on working at his trade, saved his money, observed what people wanted, studied the essential principles of home building, then with an ample fund of experience, and his little capital, he started the year 1908 by commencing work on two small brick houses, pictures of which are shown above.

These first houses contained a layout of rooms and features that he observed were what the people wanted, and he had but little trouble in selling them at a good profit. The next step was to build more and sell these, and he has kept at it for the past fourteen years.

Later, as the business grew, it was necessary to form a mortgage company so as to handle the financial part of their construction business. This is another service for the home builder, and is in line with what we have mentioned quite often in the columns of BUILDING AGE and THE BUILDERS' JOURNAL, that builders, to secure more desirable business, should form some reliable financial connections so that they will be able to offer the prospective home owner a complete service payable on easy terms. Holm will sell the lot, prepare a plan, secure the money, and build the house for a small cash payment with balance same as rent. This sounds good and meets the popular demand.

Of course, to do all this requires considerable attention to many details, and Mr. Holm has been fortunate enough to secure some able lieutenants who see that all the various little matters are attended to so that his customers are pleased and stay pleased. Mr. Holm declares, like Mr. Ford, that a satisfied customer is the best advertisement he could obtain.

Mr. Holm, away back in 1914, obtained a sworn statement from fifty satisfied customers, and he made the most use of this to convince prospective customers of his fair dealing and ability. The testimonial reads as follows:

"We, the undersigned, have purchased homes from T. A. Holm & Company, Oak Park, and have found them to be all that was claimed.

"Our dealings with this firm have been entirely satisfactory and their treatment of us has been all that could be desired.

"We are pleased to have our names added to the list of their other Satisfied Customers."

This was signed with names and addresses of Mr. Holm's customers, also the date when they bought the house, and as some of these dated back several years they had more weight. The plan was to demonstrate to prospective home buyers, through the experience of others, as certified by them, the safety and desirability of doing business with the Holm firm.

PROPERTY is the fruit of labor; property is desirable; is a positive good in the world. That some should be rich shows that others may become rich, and hence is just encouragement to industry and enterprise. Let not him who is houseless pull down the house of another, but let him work diligently and build one for himself, thus by example assuring that his own shall be safe from violence when built.

—ABRAHAM LINCOLN.

Digitized by Google

No more effective means of sales making and interest creation could be had, perhaps, than the circulation of the fac-simile signatures and addresses of satisfied buyers, all uniting in friendly aid of the building firm which had helped them in establishing their homes.

"Homes That Holm Built" has become a slogan in the districts where he operates.

One very effective way of securing interest in his advertising literature is by the use of quotation of celebrated men on the question of home ownership. A quotation of Lincoln is reproduced here. This is one of Mr. Holm's favorites.

He has always been a distinctive and progressive advertiser, using the local newspapers, both display and classified space; also by cards in the street cars, and the distribution of booklets and circulars. These are well illustrated with pictures and plans of the houses. He had an interesting display at the Chicago Own Your Home Exposition, a picture of which we show herewith. Mr. Holm is seen sitting down toward the right of the booth. Here is a big, successful builder who finds it profitable to advertise.

In scheduling the material and labor for so many building operations it is necessary to keep accurate records. An itemized cost of each building is kept on file. Cost records and accounts are maintained as nearly as possible to a 100% efficiency basis.

Building superintendents visit each job daily to inspect the work and order the necessary materials delivered to same. Delivery is made by their own auto trucks. Material for many buildings are ordered at one time, frequently in carload lots. When these arrive every item is carefuly checked over with the bill of lading or delivery tickets.

It is up to the superintendent to see that the proper material is sent to the job, and approximately the right amount is delivered to each job, a list of which is given to the foreman, who places the material on the site in convenient piles and has same delivered to the workmen at the proper time.

On every job it has been found to be a profitable investment to use a concrete mixer operated by a gasoline engine.

Here are the primary reasons why Mr. Holm has developed his big building business until it has attracted signal attention among realty men and investors in home properties:

First, he figured that thousands of Chicago men want single family houses. Second, they must be good houses, honestly built, correctly designed, and properly located. Third, the transportation to and from the city must be good, and the future value of the property protected by desirable restrictions, surroundings and plan of development. Fourth, the houses must be moderately priced. Fifth, the houses must be sold upon an easy payment plan. Sixth, the policy of the building and selling organization must be one of fair, square dealing.

Exhibit of T. A. Holm & Co., at the "Own Your Home" Exposition, Recently Held in Chicago. Mr. Holm Is Seen Seated at the Right End of the Booth.

Artistic Design *of* Modern Building *for* Bank

Brick and Terra Cotta Combined Produced Dignity and Beauty

The LYTLE CO., Architects

PROPER housing for a banking institution is not only demanded by the business of the bank, but to have a good-looking building is also a direct and valuable asset to the bank itself. People have more confidence and greater pride in dealing with a bank that is housed in an up-to-date bank building of its own.

The building shown here is that of the Brown National Bank of Sioux City, Iowa. It was designed and erected by The Lytle Company of the same city. The base of the exterior is of limestone. This forms the pedestal for the pilaster treatment, the base and caps of the pilasters are of terra cotta, as are all the other ornamental parts. The flat walls and pilaster shaft projections are of dark red tapestry brick. The entire appearance is dignified, yet artistic.

The interior is very well laid out. There is adequate public space, and good working space. There are no side windows, as this bank was built on an interior lot; adequate light is secured from the front windows which are exceptionally high.

The arrangement of the vault in the center is a little different than the plan used in the majority of small bank buildings. It has been so arranged that it is easily accessible from the banking space as well as from the customers' room, so that the safe deposit boxes can be easily reached besides affording customers the necessary privacy. To do this effectively, two small booths have been placed in the customers' room.

What the Editor Thinks

Is There a Building Boom?

THE large amount of building now being done especially along residential lines, is somewhat in the nature of a boom. There is such a thing as having too much business to attend to and it is wise at this time to pause for a short time and consider the possible troubles that may arise.

When there is an active and eager demand for materials, as well as labor, the prices are bound to increase—this is the law of supply and demand. The present excellent state of the building industry is the result of a lowering in costs, both of material and money. Labor, however, has not decreased in a like proportion.

The situation may arise where builders will be bidding against one another for material, although from statistics available there will be sufficient material to be had to handle all jobs at a proper price.

The most serious trouble is likely to occur from labor. Many people are over-anxious to build and are crowding contractors for time. The chances are that there is likely to be a shortage of skilled labor.

Many have found that the union rate of wages in some particular trades was too high, but today we hear that many builders have in some cases paid one and one-half times and more than the union scale of wages to obtain certain mechanics. This, of course, means that the cost of building will be increased and as sure as building costs increase the demand for buildings will let up. In other words, it is a case of killing the goose that lays the golden eggs.

Let us all be careful of and keep clear of this folly, and this applies alike to material men, labor and contractors. Just recall how the price of clothing went up and up until folks just stopped buying—a buyers' strike they called it.

Rather than be gouged the public will be content to put up with insufficient housing facilities for a few years longer.

Building Apprentices

SKILLED mechanics for the building industries are required at the present time on account of the great increase in building activity; the demand for good men exceeds the supply.

During the last six or eight years but very little was done to educate young men to become skilled mechanics in the different building trades. We are now back to the days where the man that knows something will be paid a better wage than the uneducated man.

The way to improve is to have proper vocational training for our young men and when they start in to do practical work they must continue their education in their chosen trade by home study.

Any earnest young man can easily obtain reliable information about the theory of his trade from text books, night schools, correspondence courses, etc. This information he can apply practically in his daily work. What is needed is ambition on the young man's part, supplemented by proper guidance.

In an interesting article in this issue we present the opinion of a prominent labor leader on this apprentice subject. We all agree that proper training of future mechanics is essential for the well-being of the building industry.

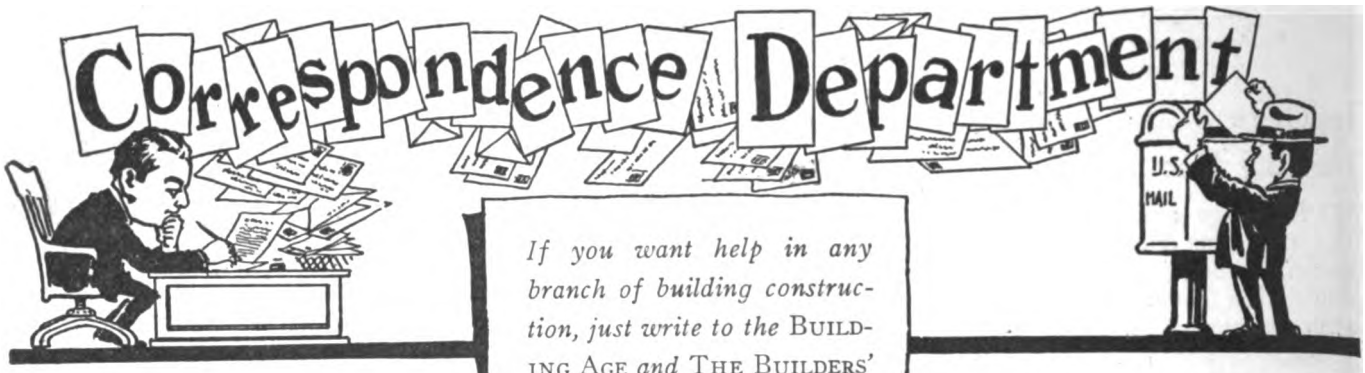
Plasterers' High Wages Increases Use of Wall Board

IN some cases, plasterers are receiving $15 and $16 per day for their work! This is an excessive amount of pay for plain plastering work and the result will be that the intending home owner of small means will be absolutely turned against plaster on account of the excessive cost.

Wall board will come to the fore; it is easily put up and is capable of being treated by simple decorative means to be a handsome and durable wall for interior use, capable of receiving various kinds of artistic treatment.

It is an unfortunate fact that there are still some loaning institutions so wedded to the plaster idea that they will not make a loan on a house unless it is to be plastered. In other words, they are, at the present time, playing into the hands of the plasterers, helping them to keep up excessive wages and tending to put the brakes on the advancing business of the building industry. This shortsighted policy adopted by some loaning institutions is, we believe, due to ignorance of the real worth and adaptability of the newer forms for producing serviceable walls.

Defective Chimneys



BUILDING a chimney in the proper way seems a simple matter but that it is not done is evident from the fact that the yearly loss by fires caused by defective chimneys and flues amounts to an average of over twelve million dollars! This stupendous sum is the loss every year due to the ignorance or the willful neglect of men in the building industry who do the work on chimneys.

The principal object in building a chimney is to prevent the flames and sparks from entering other parts of the structure from the chimney. Flue lining was devised for this very purpose but too often it is not used. In other words, one saves the cost of the flue lining and burns down the building. Some economy!

The Need of a Level and Transit

EVERY building contractor will find many uses for a good level and transit. When one possesses his own instrument it is easy to have the footings laid to the exact depth called for, floors level, etc. In foundation work one footing may be under an elevator pit or etc. To get your work out of line or at the wrong level may mean an expensive change for you to make—owning and using a well-made instrument will prevent many an error.

All readers are invited to discuss the questions and answers published.

Is Hip Shorter Than Valley Rafter?

READING with interest the article by Mr. John Parkhill, published in the April issue of the BUILDING AGE, I note he states that an unbacked hip rafter is shorter than a valley rafter of the same run and pitch. This was news to me. Theoretically he is right, but practically he is wrong.

I feel that his statements may be misleading to students of the subject and to many of your readers, and take this opportunity of explaining the catch to prevent a misunderstanding and confusion in the minds of some.

He states "that the plane or top edge of the common rafter passes through the corner of an unbacked hip rafter and to bring the corner into this plane, the hip rafter must be shortened." This statement is erroneous.

The hip rafter is not shortened, it is dropped, but it so happens that in the dropping of the hip, it does shorten a barefoot, unbacked hip rafter, but it doesn't change the length on the center line.

If the projection be added to the main rafter and laid out in one piece notched over the plate, the length does not change, whether backed or dropped. The length on the center line of a hip or valley of the same run and pitch is always the same.

This is illustrated in figure 1. The rule for dropping the hip is as follows: produce a level line anywhere on the side of the rafter as the seat cut "A-B." From the top edge of the rafter on this level line, point off one-half the thickness of the stock used for the hip as at "C." From the point "C" erect a perpendicular line as at "D." The length of this perpendicular line "C-D" is the amount of stock that should be taken off the plate level as shown by the dotted line.

It will readily be seen that the actual length of the hip is shortened "A-D." The center of the hip will not touch the wall line as shown in the plan, figure 2. The center line of the hip will be set back the distance "A-B" and the outside edges of the hip will coincide with the wall lines at "C."

On the other hand, if the projection is added and made in one piece, as shown in figure 3, the length does not change at all.

"A-B" is the original seat cut for a barefoot rafter. "A-C" equals one-half the thickness of the stock from which point a perpendicular line is drawn as at "D." The hip is dropped the length of the perpendicular line "C-D." So that if the hip was backed, the birdsmouth would be cut out on the lines "B-G-H," and if dropped, cut out on the lines "F-E-H."

I trust that I have made myself clear and simplified the question involved.
—R. M. Van Gaasbeek.

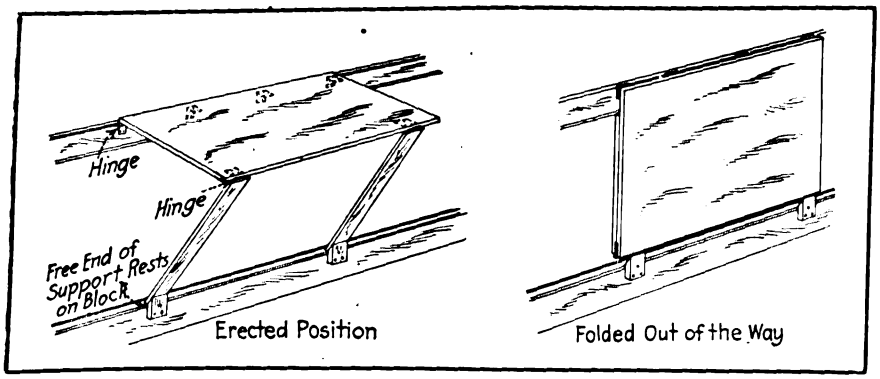
HAVE you ever used any machinery or device which has saved you time and money?



Have you ever invented any way of doing a piece of work quicker?

If you have BUILDING AGE and BUILDERS' JOURNAL wants your experience, and will pay regular space rate for it.

Your description should tell just how you saved time and money, either by a special way of using machinery or by short cuts in construction. Point out what methods you were using before adopting your "Time Saver" and show how your new method turns the trick. You can submit as many articles as you want.

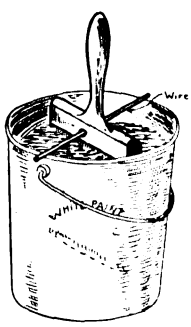
Drafting Board for Use in Limited Space

HERE is a simple idea for saving space in the builder's office, and also for the student or draftsman who does occasional work at home. The drawing board itself is the largest space-occupying unit of the drafting outfit; therefore if it can be readily put out of the way when not in use and as readily erected for use, a great saving in space can be effected. And this may be easily accomplished in the manner illustrated.

The drawing board should be attached to the window sill or wall moulding by means of small concealed hinges, and supported, as shown, below.—**C. Nye.**



Utilizing Odd Glass

A MASTER carpenter in a city of fifty thousand people, employing twelve men, makes the broken panes of glass his men take from windows, when they are setting new glass, a source of profit to him. They are instructed to save all the odd glass and return it to the shop, either carrying it back with them or sending it in the truck if it so happens that their kit is picked up by the machine. The broken panes are then stored in an out of the way corner of the glass room and on some rainy day the boss, himself, or his son, who works for him, goes over the lot, cutting it up into standard size.

Nothing is thrown away. From the smaller pieces, panes measuring 3" by 4" or 4" by 6" are cut: those come in handy for skylights. 3" by 10" and 7" by 9" are the next in size, utilized for cellar windows and sash of old-fashioned houses. 9" by 12", 9" by 13" and 10" by 14" are the most common sizes: these are in great demand for the ordinary sash. In some cases even larger panes are cut, 12½" by 24" or 12½" by 26", where the original size was large. The encrusted putty on the edge is scraped off, the glass washed, and then it is stored away in boxes with the size noted on a label pasted on each box.

Some of the glass is sold to customers, reduction of a few cents on the price being made because of the fact that it is second hand; but the greater part is used up in the course of business, on jobs of setting glass requiring the standard size. —**Henry J. Carr.**

Paint Brush Hint

HARDLY anything gets one as sore as grabbing hold of a paint brush and getting one's hand all full of paint from the handle, the brush having slipped down in the paint pot until the handle was well covered.

Here is a little kink that will get rid of the whole trouble. Simply drill a little hole in the brush above the bristles, through which run a stout wire. This will keep the brush suspended in the paint and keep the handle dry.

Try it out and see if it is not a temper-saver, to say nothing about the saving in time necessary to wipe the surplus paint off the handle and one's hands.—**C. A. Orr.**

Helping the Painter

RECENTLY an article appeared in your paper about preparing work for the painter. Now here is something I would like to add to it: Don't squirt tobacco juice all around!

It's a fine stain and a hard job to remove it from floors and trim. I have found a solution of oxalic acid a good thing to use for the removal of such stains. —**Harold Freedman.**

Concrete Mail Receiver

SOMETHING new in the way of a mail receiver for the city, suburban or country home is shown in the accompanying illustration. This may be of interest to the fellow who is thinking of building a feature of this kind.

This receiver stands before a home near Whittier, California, where the dwellings and ground are of a valuable character. In selectnig this feature the owner has chosen something that is durable in the extreme, for it is made entirely of concrete. This mail receiver would be an ornament to any home grounds.

It is five feet in height and the mail box portion is 10 x 18 inches, while the opening is 8 x 10 inches, being large enough to accommodate an ordinary size sheet iron mail box, if desired. The eaves have an overhang of about three inches all around. The round upright is ten inches in diameter and two feet long, the square section below, which is 20 inches square and two feet high. The base for the entire fixture is twelve inches deep and two feet in diameter.

The roof of this mail receiver has been painted green, while the remainder has been left the original finish that has been given to the entire fixture in general, known as "splatterdash."—**Albert Marple.**

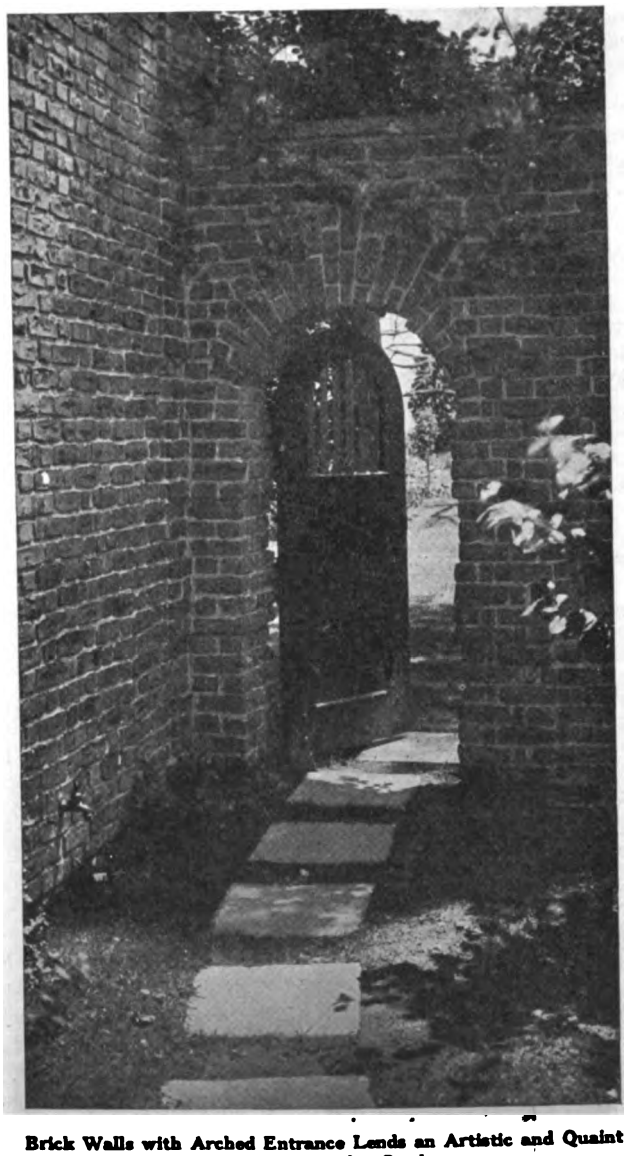
Garden Brickwork



A Chance for Profitable Jobs Some Builders Overlook

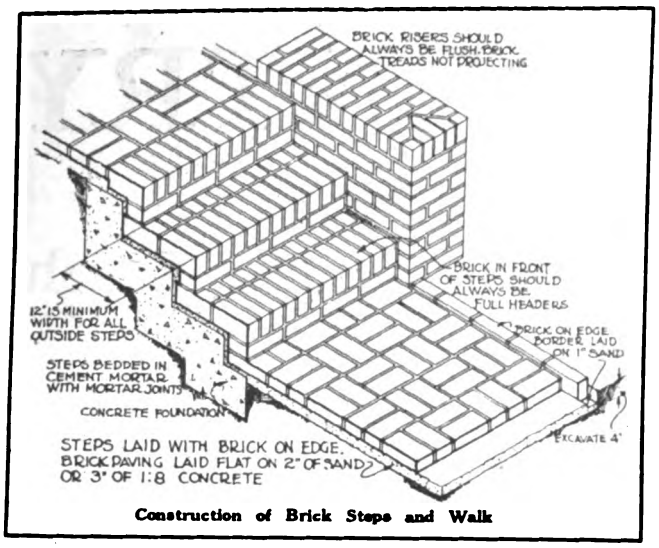
By WILLIAM CARVER, Architect

WHEN the house is finished and the keys turned over to the owner it is customary for the contractor to consider that his work on that particular job is finished. Supposing, however, that his relations with the owner have been fairly amicable the contractor has a mighty good chance, in many cases, to get another small contract in connection with the same job. He is, in fact, in a preferred position to do any extra work as a result of his long association with the owner when building the house.

When the owner takes possession the house stands raw and bare in its surroundings. Presumably the contract has called for removal of surplus earth and for rough grading about the house.

The next step is usually to call in the landscape gardener and to proceed with the planting of shrubs. But, assuming that the owner's means have not been too badly strained in the building of his house, it is here that the contractor, working with a landscape architect or gardener, can suggest to the owner the advantage of permanent brick walls and walks, and in more ambitious gardens of pergolas, summer houses, or other features as conditions warrant. Such features not only improve vastly the appearance and value of the property, but add to the owner's enjoyment of it.

Brick Walls with Arched Entrance Lends an Artistic and Quaint Enclosure for the Garden



Brickwork, by its nature and tradition, is naturally associated with garden architecture. With its beautiful colors and soft texture it blends well into any garden, formal or otherwise. When studying the celebrated gardens of Europe, and beautiful gardens which dot the landscape in various parts of the United States, one is impressed with the cool, inviting, and harmonious appearance of a background of rich red brickwork against green foliage and shrubbery.

On a hot summer day nothing looks more thoroughly inviting than a corner in a garden with spreading trees giving shade from above and ivy covered walls shutting out the horizontal shafts of heat and light. Add to this a brick walk stretching to the house and providing a streak of welcome color through the garden.

Probably much of the pleasing effect of brickwork is due to the fact that it does not glare in the sun. It does not reflect sunlight, but absorbs it, and is restful to the eye, contrasting with the green foliage and grass at the same time.

There are many selling points for garden brickwork which the contractor can use when discussing the matter

Digitized by Google

Construction of Brick Steps and Walk

with the owner. The privacy which brick walls afford should not be overlooked and this is not only an advantage in the summer time, but is of much more importance in the winter, when shrubs and trees have shed their foliage and no longer serve as a screen.

The cost of brickwork in the garden is not necessarily great, and the extra expense is well justified by its qualities of permanence, to say nothing of its beauty.

Where walls are used to divide the same property, and consequently do not have to follow a boundary line, such walls are built with a continuous wavy plan to give them stability. Thus laid out, four-inch walls are frequently built seven and eight feet high. Straight walls four inches thick are built up to four or four and a half feet high, generally reinforced at intervals of about five feet with nine-inch square piers. Thus built, a brick garden wall will last as long as a brick house—around the century mark.

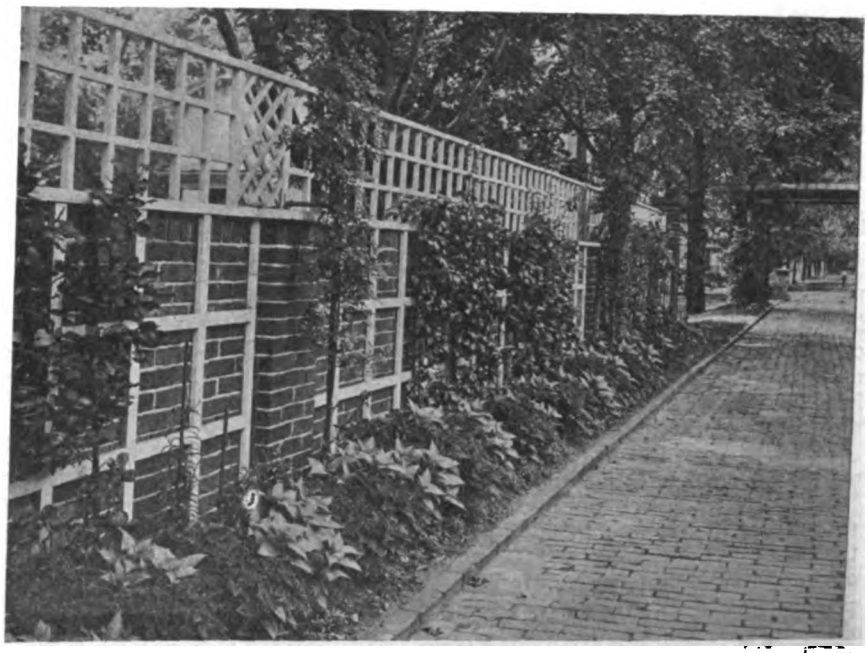
Walls should be carried below the frost line, but do not need a spread footing, except that four-inch walls should be laid on a course of headers placed on edge to insure maximum stability.

A course of brick on edge laid in rich cement mortar forms a neat and effective cap for walls eight inches thick and over. Immediately below this cap a course of shingle roofing tile or slate projecting about an inch on either side forms a drip and adds to its effective appearance, besides being useful.

Brick walks may be laid to have a variety of effects. Many people like to see a brick walk laid unevenly, probably with grass growing up in the joints; as in old walks.

The walk may also be laid in a variety of patterns, a very pleasing arrangement being the herringbone or criss cross pattern. This is, however, naturally a little more expensive than patterns in which the brick are laid square with the walk.

The brick may also be laid on edge or flat, the different size of the exposed surface of the units not only allowing a variation in effect, but also making a difference in the price of the work, brick laid flat requiring fewer brick. If an uneven effect is wanted, bed the bricks on sand, with vertical joints either sand joints or mortar joints. If it is not desirable to have vegetation appear in the joints, mix salt with the sand.



Bricks for walks, steps, or any floor surface should of course be only the hardest burned brick, and it is advisable to state the purpose for which these brick are to be used when ordering them.

On a hillside, or where there is a change in grade, brick steps can be advised to advantage and such steps also form charming ornaments in the garden. Steps should be laid on concrete, not sloped on its under surface, but stepped off so that it cannot slide out of place. Joints should be filled with mortar.

For porch floors, too, brick paving is very extensively used, its warmth of effect and economy making it a very desirable material for this purpose. Porch floors should always be laid on a concrete base, with mortar joints.

Joints in outside steps and floors should always be filled with rich cement mortar. A very effective joint is the thumb joint—a broad, slightly concave joint thoroughly rubbed with a steel jointing tool. Sometimes, in the best work, the face of the brick is given a coat of raw linseed oil before being laid, which prevents mortar sticking to it.

Pergolas, gate posts and summer houses, all these, too, come to mind as items of construction and embellishment which may be suggested by the contractor when conditions and extent of grounds would warrant their construction. It is sound business to develop one's market to the utmost for the commodity one has for sale.

Good Practice in Frame Construction and Finish

How to Frame a Roof of Unequal Pitch

By RICHARD M. VAN GAASBEEK

School of Science and Technology, Pratt Institute, Brooklyn, N. Y.

UNEQUAL pitched roofs are those formed by the intersection of two roof surfaces having different pitches, one surface sloping more than the other. The hip and valley rafters form the dividing line. The roof surface on one side of the rafters being framed to one pitch and the roof surface on the opposite side of the rafters to a greater or lesser pitch.

The plates for the two roof surfaces are at different heights, those on the short common side or steeper pitch, being higher than the plates on the long common side or lower pitch. The hip and valley rafters travel the diagonal distance of an oblong with reference to the plate in comparing them with the framing of a hip and valley rafter for a roof of equal pitch, which travel the diagonal distance of a square and cross the plate at an angle of 45 degres.

The center lines of the hip and valley rafters must intersect the facia line at the extreme corners or returns on the facia line, and because they travel the diagonal distance of an oblong, they are thrown to one side of the corner of the building or the return walls, crossing the plates at an angle to one side of the corner of the building. The common and jack rafters, as in any other roof, cross the plates at right angles. This roof creates several interesting framing problems, which at first may appear difficult, although simple, when once the basic principles are understood:

Specifications

Plate, long common side, 7/8" by 2½".

Plate, short common side, 7/8" by 3⅛".

Hip and valley rafters, ¾" by 1¼".

Common and jack rafters, ⅜" by 7/8".

Ridge, ⅜" by 1⅛".

Projection, 2".

Facia, ⅝".

Plancher level to plate level, short common rafters, 2⅝".

Plancher level to plate level, long common rafters, 2".

Pitch, long common rafters, 12" rise in one foot, (½ pitch).

Dimensions. (See plan, Fig. 1.)

Rafters, spaced 2" on centers.

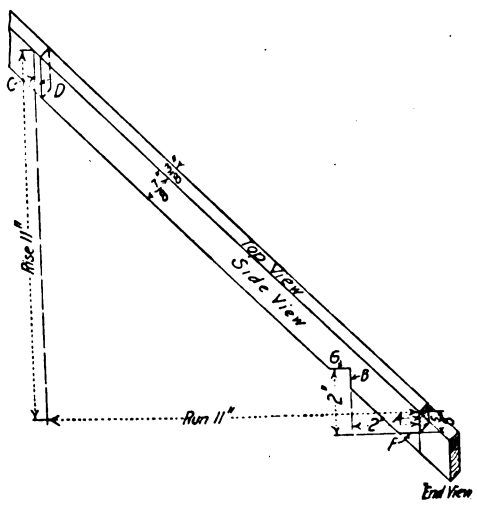

Fig. 3—Developed Length of Long Common Rafter No. 16

Lay-Out

A full size working lay-out of the plan (Figure 1) should be drawn on a board or sheet of detail paper. The lay-out will represent a scale of 1 inch to the foot. In applying the various measurements full size, substitute the word feet for inches in listing the runs and lengths of the rafters.

Number each rafter and ridge as shown on the plan. Put the corresponding numbers on the rafters as they are laid out so as to insure ready identification and proper location during the erection of the roof.

It will also be necessary to develop a profile of both the long and short common rafters on the layout, as shown in Figure 2, so as to determine the proper heights of the walls or plate levels. First, draw a profile of the long common rafters, the specifications calling for a half pitch roof, or the rafters rising 12" in one foot of run.

In a half pitch roof, the run and the rise is the same, so if the run of the long common rafter is 11" (see plan Figure 1), the total rise of the rafter must also be 11".

With the total rise of the roof known draw a profile of the short common rafter, the run of which is 8", thus determining the pitch of the short common rafters. In accordance with the specifications which give the desired width of the facia and projection, locate the plate levels on either rafter.

Digitized by Google

It will be discovered that if the plates on walls J-K and L, which support the long common rafters, were on the same level or height as the plates on walls M-N and O, which support the short common rafters, the birdsmouth on the long common rafters would almost cut the rafters in two.

To overcome this difficulty the plates on walls J-K and L, which support the long common rafters, are dropped sufficiently to get a good seat cut on the plates and yet not weaken the rafter at the birdsmouth.

With the birdsmouth developed independently on both long and short common rafters, measure the height of each plate level from the plancher level and subtract the two figures, which will give the difference in the heights of the two plate levels, the plancher level being level throughout the entire roof.

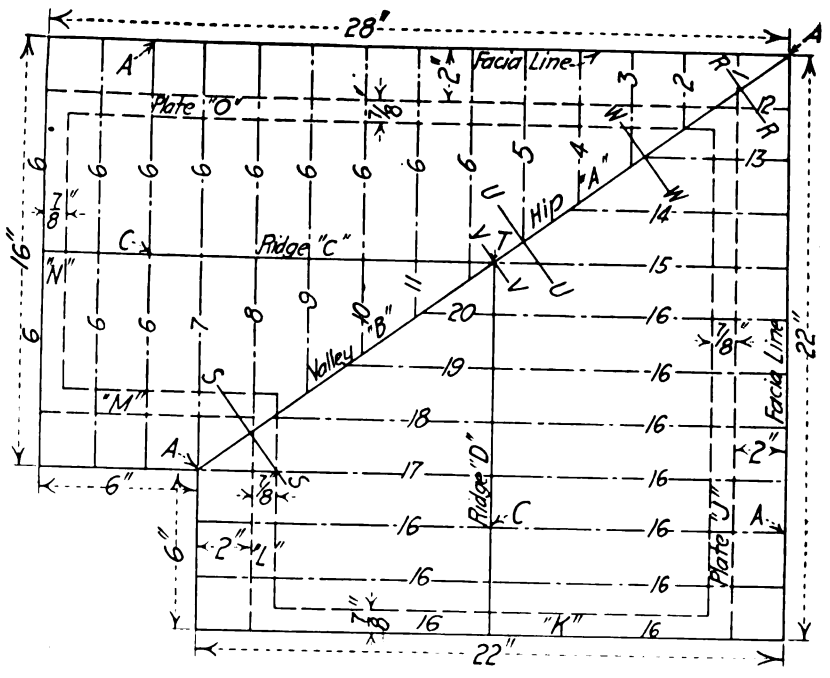

Fig. 1—Plan of Hip and Valley Roof of Unequal Pitch From Which Layout Is Made

To Lay Out Long Common Rafter

The pitch of long common rafters No. 16, required by the specifications, is 12" rise in one foot. The run is taken from the lay-out, Figure 1, measuring from the facia line to center line of ridge "D", A-C, or 11".

Set the fence and square at 12" rise on the tongue and 12" run on the blade. Mark on the tongue for all plumb cuts and on the blade for all level cuts. Press the fence firmly against the top edge of the stock to be used and produce the facia line or first plumb line to the extreme right, A, Figure 3.

Slide the fence to the left and measure on a level line from facia line A, the run of the rafter, 11" and produce plumb line C, Figure 3, the extreme length of the rafter to the center line of ridge D. From this length deduct one-half the thickness of the ridge, 3/16", and produce plumb line D, the cutting length of the rafter against the ridge.

To complete the lay-out of the lower end of the rafter, measure in from facia line A, measuring on a level line, 2", the width of the projection, locating wall line B.

Measure down on facia line A, from the top edge of the rafter, 5/8", the width of the facia, locating plancher level F.

Measure up from plancher level F, measuring on a plumb line, 2", (Note: Take this distance from the lay-out Figure 2), locating plate level G. Cut on line A for the facia, on line F, for the plancher level, on lines G and B for the birdsmouth, and on line D for the cut against the ridge.

In the next issue the method of finding the developed length of the jack rafters will be discussed.

The problem of the unequal pitch roof is a very interesting one, and every student of roof framing will find that there are many points to be considered so as to obtain a good job without constant cutting and trying.

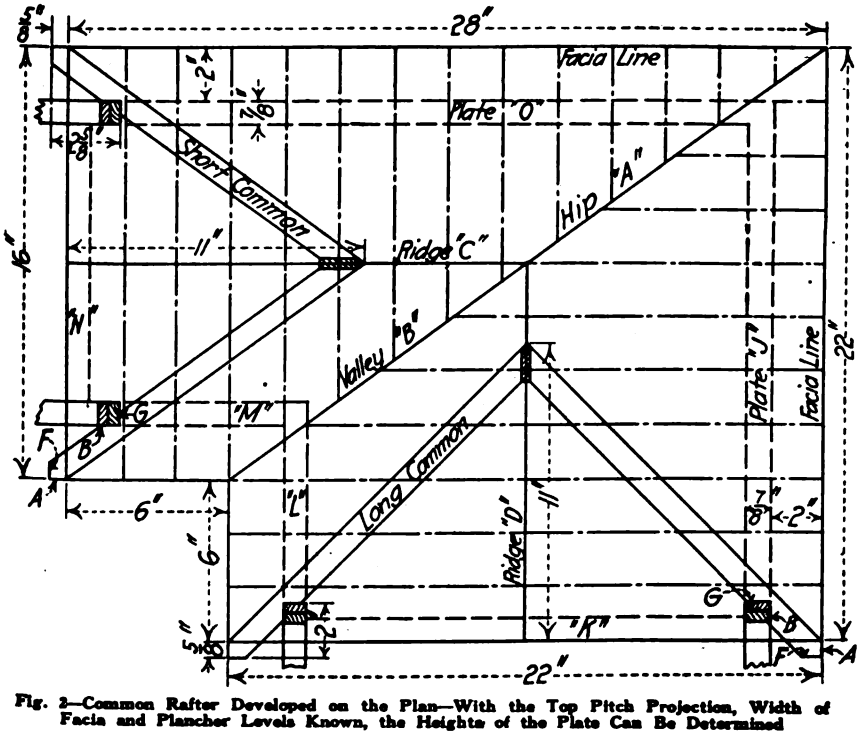

Fig. 2—Common Rafter Developed on the Plan—With the Top Pitch Projection, Width of Facia and Plancher Levels Known, the Heights of the Plate Can Be Determined

Detail for Stucco Porch Construction

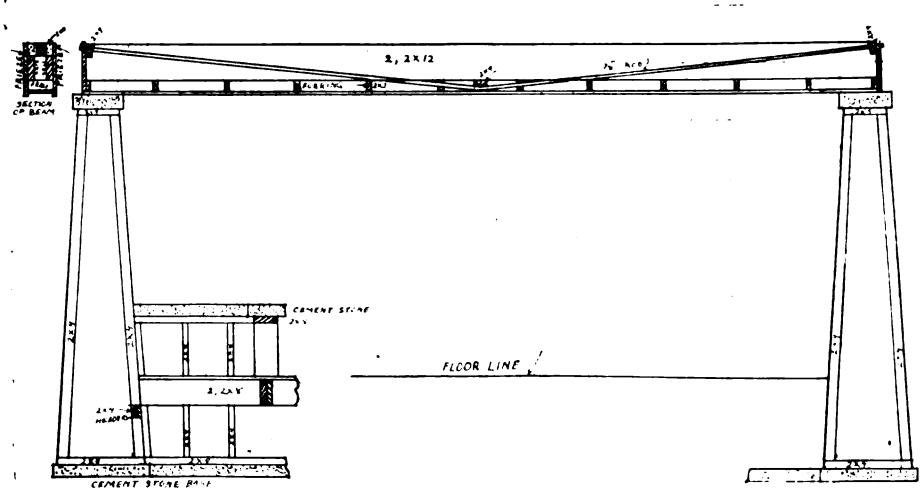
Practical Instructions on How to Build a Wide Span Porch

By I. P. HICKS

MANY bungalow houses are now being built with a stucco exterior finish and with wide spans between the porch columns. There are many of them where there are but two columns, even when the porch extends all the way across the front of the house. When built in this way the columns and the porch beam should be built very large and strong, which gives the structure a massive and grand appearance.

This kind of construction makes it absolutely necessary to build a strong porch beam, one that will be sure to carry the weight of the roof without any danger of sagging. Our sketch shows how to build such a beam. Take two 2x12's of the required length, space them the proper distance apart, frame in a 2x4 or 2x6 on the ends as shown, spike on a 2x4 or 2x6 on the bottom in the center, then put in a ⅞-inch truss rod from end to end and with a wrench turn the nuts up tight. With this kind of construction you can safely span a 24 foot porch with only two columns. For spans up to 26 or 28 feet we recommend three 2x12's and two ⅞-inch rods.

The furring at the bottom is necessary for there must be depth to the beam in order to give strength to the truss. The furring could be made a little less. It could be cut down to about 1½ inches by using a metal plate on the bottom of the beam instead of the wood. The plate should be about ½ inch thick and 6 inches wide. This would really be better than the wood for the iron truss rods might cut into the wood, which would be the result in case of great weight coming on the beam. For safety use the iron plate over the bottom of the beam and also put an iron plate over the 2x4 at the ends of the beams. When this is done you should have a beam that should never fail to carry the load placed upon it.



The Type of Porch Needing Special Framing to Support Rafters

Build the columns strong and large so that they will look massive and in accord with the beam above. They should be about 2 feet 6 inches square at the bottom and 1 feet 3 inches at the top for the frame work. The frame work should be braced diagonally across the columns in order to keep them square and should be bolted to the cement base at the bottom.

The columns can be sheathed up with Bishopric stucco board. It gives strength to the column and is an ideal material over which to apply stucco. Do not use wood lath over the beam or the column caps, use metal lath of an approved make for these places. The shrinkage of wood lath in such places is sure to result in unsightly cracks in the stucco finish. See that the furring is well nailed and that the metal lath is securely fastened to the furring and that the lath is well lapped where the joints are made. You must have solid and well built work if you are to get a satisfactory job, all of which can easily be had if due care is used in the construction work.

Put in a cement stone base at the ground line of the column. In fact every house that is to be stuccoed to the ground should have a cement stone base run all the way around just at the ground line and to extend 4 inches above the ground. This makes a fine place for the starting of the stucco and being a little above the ground it does not have the tendency to get dirty.

A Method of Framing to Support the Rafters

Prize Winning Remodeling Job

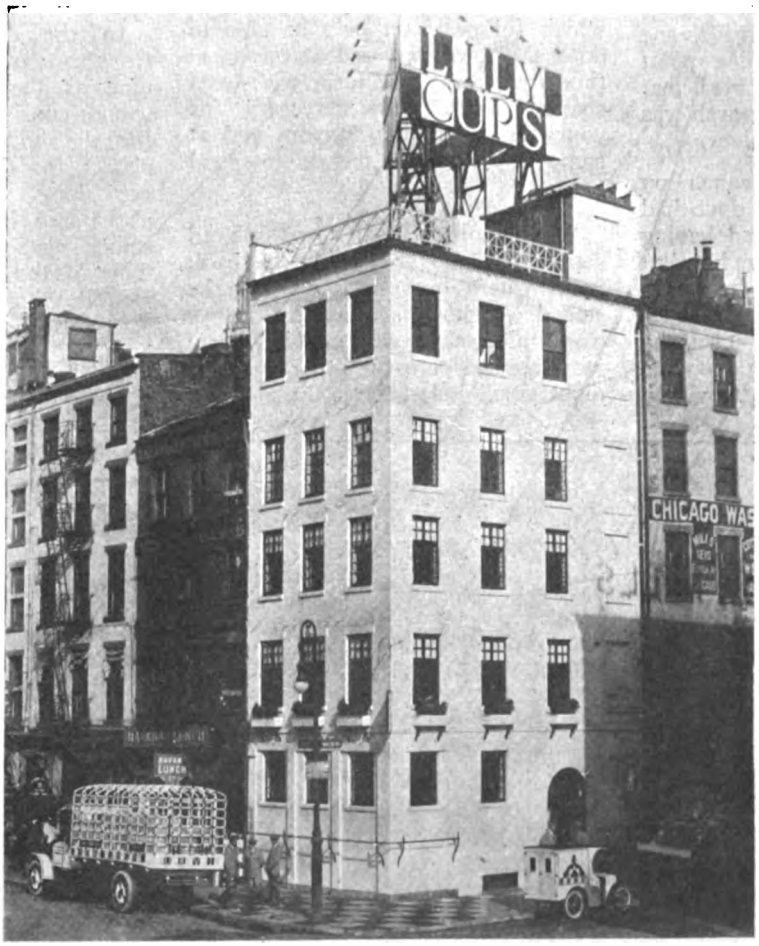
Interesting Alteration of Old Saloon Building Into Modern Office Structure

NEW buildings for old sounds somewhat like the tale of Aladdin and the Wonderful Lamp. But many remodeling jobs have lately been finished that are truly remarkable in the great change that they have made in the appearance of an old, dilapidated building.

In our January issue we showed pictures of the remodeling of an old but well built office building into a modern structure for the International Mercantile Marine Company. This was a very interesting job, and was awarded first prize by the Downtown League of New York for the best alteration job in 1921. The second prize was made to Errett, the Lily Cup man, for the alteration of a very unattractive saloon and tenement property at Fulton and Water Streets, in New York.

This whole building was remodeled into a clean little office building that adds dignity to the neighborhood. The appearance of the building before alteration was exactly the same as the building to its right. A similar building is shown on the left, with one building intervening.

This modern office building used to be a dingy saloon with characteristic projecting doors and a "ladies' entrance" under the old-fashioned outside steps, which led to a ramshackle factory above, itself provided with an unsightly fire-escape. The present appearance of the adjoining property gives you the idea.



Under the direction of J. J. Diemer, architect, James C. Hoe's Sons, Inc., builders, took out the insides of building and replaced with modern steel construction "and everything." The old hoistway was rebuilt to be occupied by an Otis automatic, electric elevator, and the old steps gave place to a new fireproof inside stairway, cellar to roof.

Tiled floors were laid on all floors, steel windows installed, interior walls covered with black oak wainscoting. Black oak beamed ceilings with cement plaster panelings, black and white wash-rooms, and the black and white entrance gave the Lily Cup trade-mark. In the cellar an automatic gas-heated steam boiler was installed.

Outside, the saloon appearance was removed by altering the window openings, erecting an arched iron doorway, and facing the entire front with white Portland cement. John Gallin & Son, the mason, did this.

An immense steel sign with great enameled steel letters like kid's blocks stands high above the roof. Lighted at night it announces to passengers on the Brooklyn Bridge, to night workers in downtown office buildings, and to folks who loiter in the neighborhood of City Hall, that this is the New York home of a progressive manufacturer.

It is rather interesting to note what great improvements can be made in old buildings to have them modern in appointments and artistic in design. There are many thousands of good substantial buildings that are relics of a bygone age when folks only thought to build strongly without giving any thought to architectural design.

Buildings of this sort offer a very profitable field of work for the building contractor. Make suggestions of what can be done and show a sketch to the owners and interest will be aroused and many an order secured this way.

Main Street in most of our older towns certainly presents a very unattractive appearance to our modern eyes and tastes. Builders, by working in conjunction with their local Chamber of Commerce, can stir up considerable interest in making a town beautiful.

One of the biggest arguments to use to put over this idea is that it will pay for itself in increased trade.

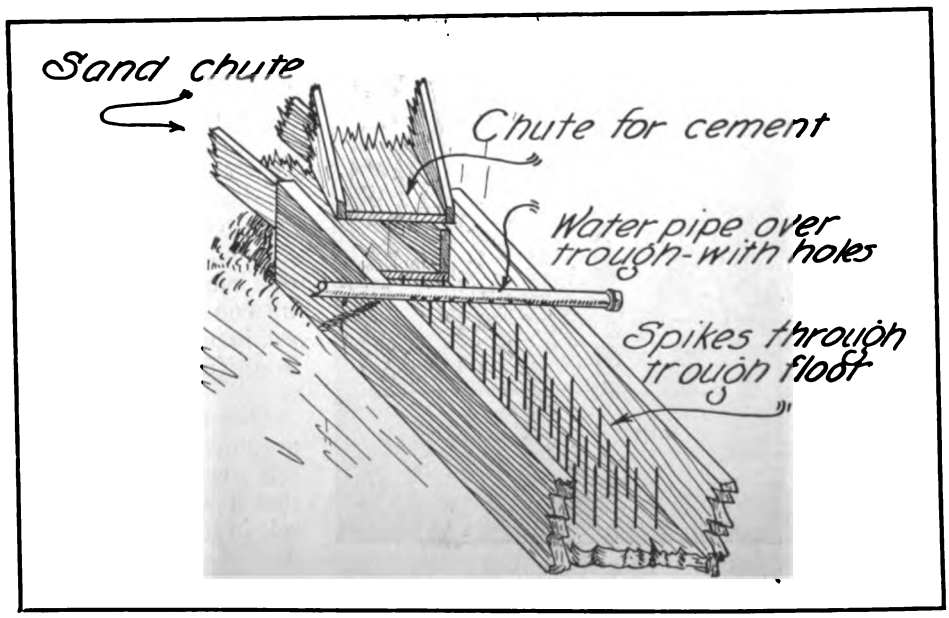
CONCRETE
Form Work-Reinforcing Methods
Monolithic and Block Construction

A Few Concrete Hints



By DALE R. VAN HORN

HERE is a novel way of mixing concrete by the action of gravity which was used on a large concrete job. The work to be done was at the bottom of a rather narrow, but deep ravine and the nature of the work consisted of the erection of a concrete dam across the bottom. This job was staged some thirty miles from a shipping point and after it had been decided that the dam was to be put in, search was made, and in vain, for a mixer.

The foreman of the ranch on which the work was being done had seen a bit of country. And having seen, he had also observed as he went along. So that, all in all, he was a pretty practical fellow. He suggested the mixing of the mortar by sliding it down a trough laid on the bank of the ravine. Providing proper and necessary precautions were taken, he said, things should turn out all to the good. And since he bossed the job, things went as intended and did work out all right.

By means of the accompanying drawing and a short description which follows, you may be able to dope the thing out and at the same time tuck away the idea, with such changes as may be necessary for your particular environment, and at some future time put it to good use.

A temporary tank was placed some distance farther up the bank from where operations were to be staged. From this was run a length of old pipe which was found. A cap was screwed onto the other end and eight small holes about three thirty-seconds of an inch were drilled near the end in a space eight inches long. Between the tank and the lower end of the pipe, a valve was placed so that the amount of water could be regulated to suit the condition of the sand and cement.

In the drawing is shown the trough, two chutes and the water pipe as they were installed. The trough consisted of a ten-inch plank for the bottom with two six-inch planks for the sides, each eighteen feet long. At regular intervals, about two inches apart, each way, spikes were then driven through the floor of the trough from the under side, leaving about three inches of the ends protruding, as shown.

Two chutes were introduced into the upper end of the trough, one above the other, and each at an angle sufficient to insure the moving of the material as soon as it was placed there.

The chute for the cement was run back and to one side and connected to a small hopper, with an adjustable door so that the quantity of cement passing through in a given time could, too, be regulated.

With a little practice it was found that one man, shovelling steadily and at a moderate rate, could furnish the aggregate for the finished mixture. The water supply valve and the door in the cement hopper were then adjusted accordingly.

The trough, when set on the bank, was about forty-five degrees from the horizontal and the lower end

Digitized by Google

emptied into a wide, shallow receptacle, from which the concrete mixture was carried by the two workmen below to the forms of the dam.

On small jobs when the chance presents itself, the use of gravity for this purpose will come in handy, since considerable time will be saved in the process, the amount depending upon the size of the job and the speed with which the ingredients are run through the stages.

Omitting Reinforcing

It is surprising how some folks will want to save a little money by omitting some really important part of construction, bracing and reinforcement seem to be items often picked upon. We illustrate here a couple of examples of what is likely to result by omitting the reinforcing in concrete work.

In one case the owner was laying a concrete foundation for a barn. Thinking that he could effectively cut the cost by doing this work himself with the aid of two hired men, he apparently was taking every precaution against possible failure. The forms were filled, the bolts were placed for the sills and in due time the carpenters and contractor arrived and the barn was built.

Six months later, a large crack appeared at three of the four corners of the foundation. Perplexed, the owner went to the contractor and sought his opinion.

Wall Failure in Solid Concrete

"Did you reinforce the corners," the contractor asked.

"No."

"Why not?"

"Didn't think it was necessary," the owner replied.

That short conversation seems to contain a lesson. Because the owner thought that he knew the rules of the game, the very foundation of the structure was weakened. Two years later one side of the barn had settled to such an extent that it was necessary to remove the wall and replace it. The cost doubled the original cost of the foundation. It would have been much cheaper to have left the whole program in the hands of one who knew what to do.

If you know how to do it, all right, but be sure that you do. First, be sure you're right, then go ahead. That simple slogan would have meant money saved to this owner.

While on the subject of construction, it might not be out of place to consider, briefly, retaining walls. The cut showing a fractured corner of concrete blocks is but a common example of what results when such walls with side pressure are built regardless of the existing natural laws.

A compound fracture exists here. The wall has not only given way. due to lack of reinforcing, but the lower corner blocks have been split, due to uneven settling. A little extra time spent here when building, would have prevented the trouble.

This long crack is due to the uneven settling of one wall and also to the tipping outward of the other, due to this side pressure.

Two things would have prevented this damage: if the foundation had been laid on solid ground, or upon earth properly prepared, the settling would not have taken place. The use of reinforcing would have prevented the second.

No matter how sound concrete blocks are constructed, they give way, if the force exerted is sufficient. The reinforcing should have been quarter-inch rods, bent at right angles and the ends bent down or up, to fit into the first joints.

Shovel for Concrete

When mixing thin plasters and mortars an old square point shovel which has been slightly altered to suit the occasion, will come in handy. If holes are cut through the sheet metal large enough to let considerable mortar through at each stoke, the mixing will be much more rapid than in the ordinary way.

Another Wall Failure

Mark lines on the back of the shovel proper two inches apart and over an area extending from a point two inches from the blade to where the hump shows the location of the lower end of the handle.

Drill holes on these lines, two inches apart and afterward smooth off the rough edges left by the drill. This alteration will take care of mortar which includes a medium grade of sand as the largest of the aggregate.

If a shovel is wanted for slightly larger or coarser work, or work which will not contain quite as much water, drill holes in pairs one inch apart, with a five-eights inch drill and then with a cold chisel cut away the narrow intervening metal portions between the pairs of holes. This process leaves holes five-eights of an inch in width and not quite two inches long.

In mixing concrete it is knowledge gained by experience that will tell a man when the mixture is just right. Lack of enough water results in a dry or mealy mixture and too much water results in a soup that is bound to run out of the forms and carry most of the cement with it.

WHAT'S NEW

New Materials and Equipment that Keep Your Work Up to Date

Device for Fastening Wallboard

AFTER two years of experiment, the Upson Company, manufacturer of wallboard products, has recently placed on the market a little device which not only makes the putting up of wallboard easier, but produces a better job.

Carpenters have tried for years to make a good job of applying wallboard by countersinking nails. But nail-head depressions are almost impossible to conceal successfully, even by the best of painters.

This great little improvement, known as the "Upson Self-Clinching Fastener," eliminates this one big objection. The fasteners are nailed to the studding, prongs outward, before the wallboard is applied. A piece of 2x4 is then placed upon the wallboard panel over the fasteners, and a few heavy blows are struck upon it with a hammer.

The prongs firmly clinch the wallboard from the back. The surface of the board is not marred or disfigured in any way—a clear, unbroken spread of paneling is ready for the painter.

Like most of our every day conveniences, the outstanding feature of this fastener is its simplicity. It is made of tempered steel, and is about one inch square. It has five prongs. One of these is straight, and the other four are curved. The straight prong holds the panel so that it will not move from side to side. At the top of the fastener is a nail slot for fastening it to the studding.

Tests have been made demonstrating that one fastener will hold more firmly than nine finishing nails.

The use of this fastener cuts down the cost of installing wallboard by one-half. It eliminates the tedious

labor and cost of countersinking hundreds of finishing nails. It does away with the cost of filling nail holes —a difficult thing, seldom done perfectly.

The introduction of this fastener appears to be one of the biggest steps in the development of the wallboard industry. It is the final step in the use of quality wallboard in the finest of homes. As the wallboard is held firmly in place at every stud handsome wall paper can be used without fear of cracking, as bulging is entirely eliminated.

Handy Saw Table

HERE is a portable machine that can be easily moved by two men and is especially desirable for use on repair or new jobs where it can be carried from floor to floor and from room to room. It is operated by an attached electric work. The size of the table is 18x24 inches and it is 3 feet from the floor. The weight is 170 pounds.

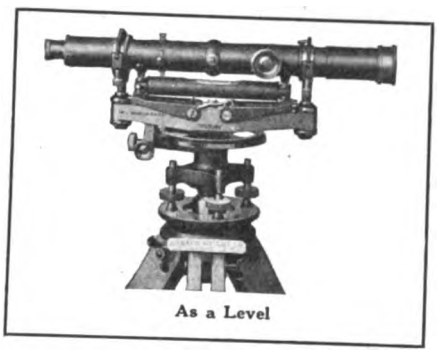
It is a light weight yet strong machine and is manufactured by the American Saw Mill Machinery Co., Hackettstown, New Jersey.

A light weight strong machine, having tubular steel legs cast into corner fittings, forming an inseparable rigid frame to which the steel top is attached. This frame also supports the swinging arm or yoke which carries the saw mandrel.

When fitted for belt drive the countershaft turns in babbitted bearings. When motor driven the motor is mounted on a wood base attached to the swinging arm and belt centres do not change in adjusting the saw.

The illustration shows the motor running clockwise. When a non-reversible anti-clockwise motor is used the position of the motor may be reversed.

The saw may be raised or lowered and is held in any position by means of a positive clamp, a convenient handle being provided for raising and lowering the arm.

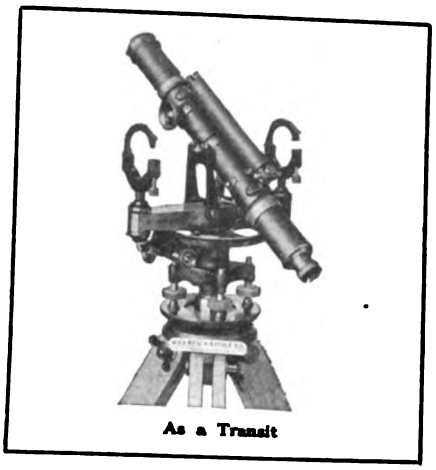


A slot is planed in the table for cut-off gauge which is supplied with each machine. This gauge can be set at any angle, right or left, for mitre work.

An excellent ripping gauge is provided which opens 8½ inches from the saw and is held in any position by a quick-acting clamp. It is adjustable for alignment with saw and can be removed quickly for long cut-off work.

Safety guard and splitter and guard is provided, the saw being guarded both above and below the table.

The construction of the machine is such that it may be changed from belt to motor drive simply by removing the pulleys and mounting the motor, no extra parts except the wood motor base being required. A motor driven machine can be changed to belt driven by the addition of the countershaft and pulleys.



As a Level

Combination Level and Transit

BUILDERS are just as anxious to obtain results quickly as well as accurately and this is true of leveling as well as other operations.

The new Sterling level as shown here is made by the Warren-Knight Co., Philadelphia, Pa. It is a level that can be instantly changed to a transit (for sighting points above and below the level of the instrument) without the use of detachable parts and free from all of the drawbacks of the usual makes of levels.

The top of telescope is free from projections which would obstruct free sighting. The convertible device consists of two permanently attached hinged uprights for instantly changing the instrument into a transit with a range of over 45 degrees of elevation or depression in the vertical plane and provided with spring tension trunnion clips for frictionally retaining telescope in any desired position. The uprights may be folded down against the level bar when not in use.

As a Transit

Asbestos Building Lumber

THE high cost of installing tile work in the bathrooms and kitchens of our moderate cost homes have made builders to look for some other suitable material that would give a good appearance and that will stand the hard wear that such a wall is necessarily subjected to.

Ambler Asbestos Building Lumber is such a material. The Asbestos Shingle, Slate & Sheathing Company of Ambler, Pa., manufacture this building lumber in thickness of 3/16 of an inch up to any desired thickness and it can therefore be used for a large variety of purposes.

For wainscoting this asbestos lumber can be had grooved in squares or oblongs and furnished with a moulded cap of the same material which may be used to give a tile effect at a very nominal cost.

This asbestos lumber does not require painting for a finish, but if such is desired it can be used. Some very pretty effects can be obtained by having a stenciled border on some of the tile-like divisions of the wainscot, etc., thus it lends itself to simple artistic treatment.

Asbestos building lumber, within a moderate length of time after it is manufactured, can be treated very much in the same manner as wood, since it may be sawed, chiseled, planed, etc., and nails driven through it without cracking; it seems to become tougher and harder with age.

As it is a fireproof material it has many uses in electrical installations as it is also a non-conductor. For houses with wallboard walls it is an excellent material to be used on the wall space behind the kitchen range, as it is fireproof and also a good heat insulation.

BUSINESS GETTING METHODS

Ideas that have worked for others

How One Builder Advertises

KEEP OUT THE FLIES

MY FULL SIZED WINDOW SCREENS are made from Clear Cypress Lumber thoroughly dried. All joints are morticed and tenoned to prevent warping, sagging or opening. The edge of the wire cloth is covered with plain screen mould ing carefully fitted into place, insuring a neat workman like finish. I use the best GALVANOID screen wire cloth obtainable. I recommend the use of Galvanoid Wire Cloth, which costs only a few cents more than the black wire, and has a far much longer life. Galvanoid Wire is a STEEL WIRE. Galvanized before it is woven. Then is Re-Galvanized after it is woven and then run through a transparent VARNISH BATH.

All my screens are made from 1-1-8 Clear Cypress and are made to order only As these screens are made from Clear Cypress Lumber they are furrished pain ted, two coats with best drop black paint, unless otherwise ordered As they are made from clear lumber there are no defects to conceal, and the quality is suitable for either Natural Finish or paint.

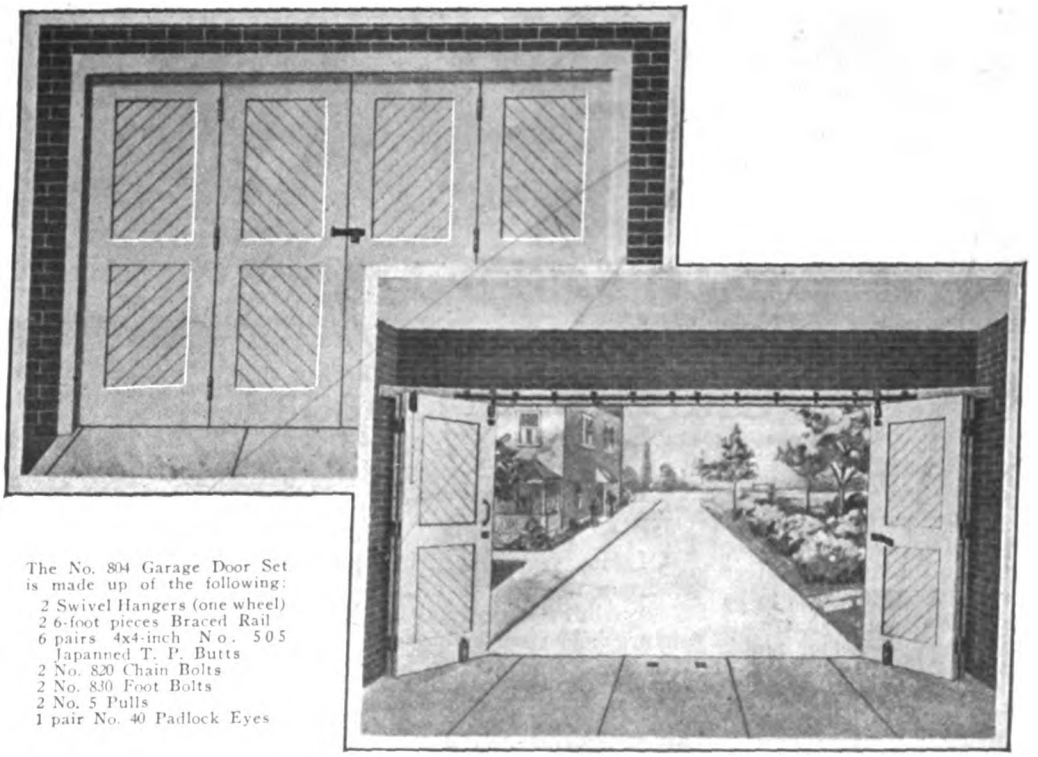
I also make SCREEN DOORS, which are made up of the same kind of material and I can furnish these doors to you in just the plain door or the combination screen and storm door, painted or unpainted, any style or size made to order. I can furnish you these on short notice, no Competition closer than the mill. Send me your list of Screens for estimate, before placing your order.

(I also carry a full line of screen wire at all times.)

J. E. DONAHO, MILTON, IOWA.

FLY-TIME is about here and there will be plenty of people wanting screens. The past few months would have been the best time to have had made these, but most folks will usually wait until the last minute before ordering anything, and this is true of screens as well as of nearly everything else.

In the illustration given above we show one side of an interesting card which was recently circulated by a progressive builder of Iowa to every house in his town. The reverse side of this card contained a large illustration of a fly. Mr. Donaho has several other interesting cards that he uses from time to time. Each one of them has the trade-mark which is shown on the upper left hand corner of this screen card. It is a good plan to have a trade mark and use it on everything, stationery, signs, etc.



The making of screens is, of course, a very simple job, but there is a way of making them better. Years ago folks were content to just simply have screens, and they did not care how the frames were made or what hardware was used to keep them in place, and a poor quality of wire screening, or even cotton fly netting, was generally used. Of course, these screens soon rusted away and the frames came apart. Substantial construction pays, both on the house and on its equipment, and screens should receive the same amount of careful attention as any other part of the house. When well made, they will last a long while.

Particular care should, of course, be taken in making the corners secure. The custom has been to just mitre the corners together, and use a few crimped nails to hold them in place. This kind of screen soon parts, and is unsatisfactory after a few years. For temporary work, of course, this cheap method of manufacture is allowable.

Today one can obtain different kinds of screen hardware which really have many advantages. Screens can be hinged so as to open like casement windows, and for screen doors there are many different sorts of spring hinges and different catches. The old hook and eye bolt is rapidly being displaced by some respectable-looking hardware that gives a certain class to the entire outfit.

Where a large number of screens are employed on a building, it is wise to have them numbered. Nowadays one can buy duplicate numbered tacks, one to go on the screen and the other to go on the window sill, etc. In this way there is no trying each screen to see if it will fit in a certain place when putting them up.

The No. 804 Garage Door Set is made up of the following:
2 Swivel Hangers (one wheel)
2 6-foot pieces Braced Rail
6 pairs 4x4-inch No. 505 Japanned T. P. Butts
2 No. 820 Chain Bolts
2 No. 830 Foot Bolts
2 No. 5 Pulls
1 pair No. 40 Padlock Eyes

When You Install A National Garage Set You've Got the Best There Is!

And the best is none too good when the qualities of the job you turn out are at stake. Doors that open and close easily and do not sag; doors that require a minimum of space when open, and are weather-tight—such are proofs of the judicious selection on your part of a good Garage Set.

The No. 804 Garage Door Set illustrated, features each of the above points and in addition allows for a hanger construction permitting doors to swing into opening against stops. Neither snow nor ice will interfere with the opening and closing.

This set works as freely and easily as any house door—simply push and the doors are open; a slight pull and the doors are closed. Complete instructions accompany each set that comes packed complete in a box.

Each style of door—every sort of garage—has its own type of Door Set peculiarly adapted for that use. Above is shown our No. 804 and our catalog illustrates and describes a number of other styles. Write for copy of our "National Garage Hardware" Catalog.

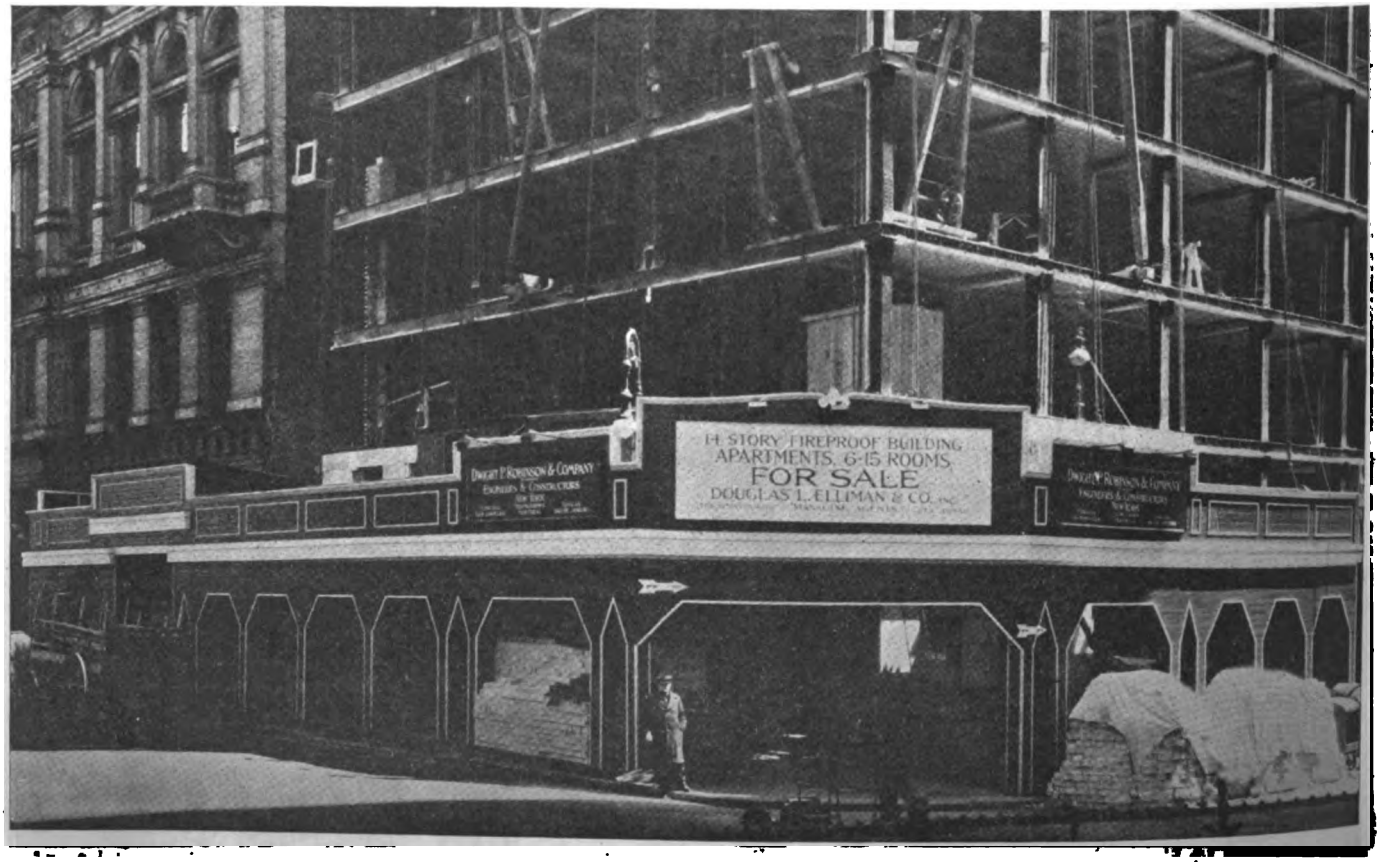
CONTRACTING EQUIPMENT

Reliable Information on Time and Labor Saving Devices

Side Walk Sheds



IT is a requirement in nearly all large cities that whenever a building or any part thereof situated within 10 feet of the building line, is to be raised to exceed 40 feet in height, a Side Walk Shed is to be used for the protection of pedestrians. This rule also applies when buildings are being demolished.

Naturally such a shed, which needs to carry quite a heavy load, must be very substantially built. It is usually made of heavy timbers as supports, with good solid joists and heavy planking for flooring. Unfortunately, this construction is more substantial than elegant, and it is usually an eyesore while it is in place. It seems to be one of the necessary evils in building.

Of late years there has been a tendency to make this Side Walk Shed a little ornamental, and in the picture below we give a very interesting example of this. This particular Side Walk Shed was erected by Dwight P. Robinson & Company of New York, on a new building operation at Park Avenue and 58th Street, where they are building a large fourteen-story apartment house.

This Side Walk Shed is stoutly built, and has been well finished with new lumber, and it is painted with two coats of dark olive green paint with buff trimmings. Besides serving for building construction purposes, it also serves as a good publicity space, as it supports four electric signs which are illuminated at night.

A protection of this character makes a side walk safe, keeps the premises clear of materials, and directs favorable attention to the building operation, impressing the public mind in a definite way that a construction project is going forward by some wide-awake and careful contracting firm.

Enduring attractiveness and low repair costs

THE same qualities in Redwood which assure enduring beauty to these houses in the Country Club District of Kansas City, make excellent selling points for the building contractor in marketing one or a dozen houses protected by enduring Redwood.

Redwood is not subject to any form of decay. A *natural*, odorless preservative permeates every fibre of Redwood during the growth of the tree and protects it against fungus diseases and against boring worms and insects. Seasoning does not destroy this preservative. Exposed to the weather or in contact with ground moisture, Redwood remains sound indefinitely. This keeps repair costs low.

Redwood's uniform cell structure gives the wood a firm, even texture and excellent working qualities. Waste is cut to a minimum and labor costs are smaller.

Redwood takes and holds paint unusually well and thus paint lasts longer in good condition. Re-painting is required less frequently.

Redwood's freedom from resinous compounds reduces the fire hazard.

Redwood lumber and millwork can be bought at prices little higher than for wood which cannot compare with it in rot-resistance or proportion of clear lumber, free from ordinary defects. T. P. L. Co. Redwood is properly seasoned. It does not warp, shrink or swell.

Using Redwood you can emphasize these points. They make selling easier.

Builders and architects will be interested in our "Construction Digest" and our "Engineering Digest", and also in our new "Redwood Homes Booklet". Our New York or Chicago office will gladly forward any or all of this literature.

ALL readers are invited to ask any questions that will help them solve any legal difficulty that they may be in. Our legal adviser will answer direct by mail and give his opinion as to the correct procedure. Questions and answers of general interest to the trade will be published in these columns. All inquiries must be accompanied by the name and address of the correspondent so that he may be answered direct or that he may be requested for further information if necessary to the intelligent answering of his question. No names will be published, only initials or a nome de plume. Remember that this service is free to subscribers. Address Legal Department, Building Age and The Builders' Journal, 920 Broadway, New York City.

Right to Enforce Claim for Work Done

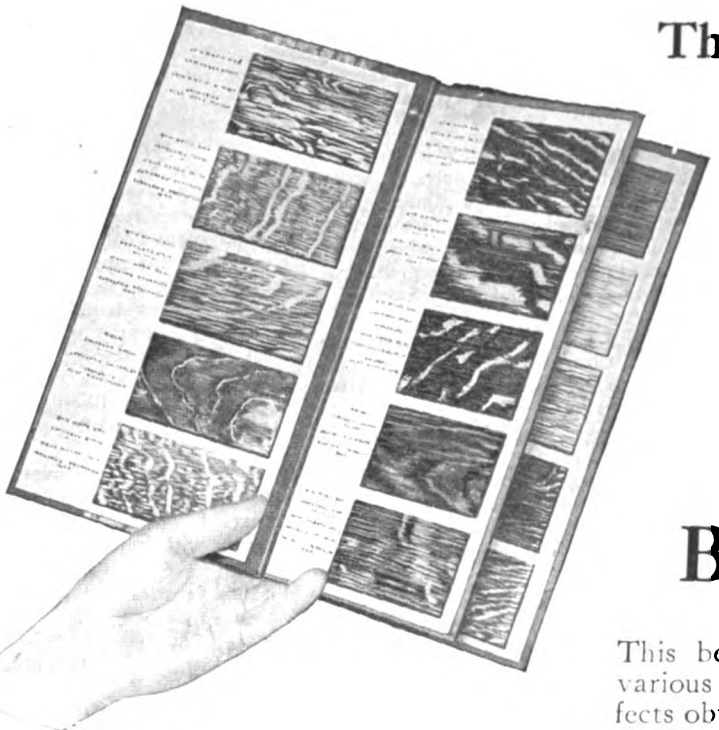
IN October, 1919, B was taken by V to the latter's mill with a view to B doing some expert mechanical work on it. On the way there V asked B what his charges would be. B replied that he was then getting $10 per day and expenses, including board and carefare, etc. Nothing more was then said about wages. In November V's brother asked B what the charge would be, and B replied that V knew all about it. The weather being unfavorable, the work was not commenced then. But in August, 1920, it was started, without any further agreement as to wages. After B had worked 18 days he asked V to pay him $225 on account. Without asking B how long he had worked, and without any mutual understanding as to the wage rate to be applied, V gave B a check for $225 and B credited the payment on his time sheet as covering 18 days at $12.50 per day, without charge for board, etc. Completing the work the last of October, 1920, B worked in all 48¼ days. Shortly afterwards he went away on another job and wrote to V for an additional payment of $300, stating that he, B, was not sure what balance was due him, because he did not have his time sheet with him, but that he was sure there would be an additional payment due after receiving the $300. V remitted the $300, and in June, 1921, B sent him a bill for $84.38, covering the balance due, computed at $12.50 per day. V now refuses to settle, claiming that he bargained for a rate of $10 per day. B received $15 per day plus expenses for work done for other persons before and after doing this work, and worked 10 hours a day for V, as against 8 and 9 hours for his other employers. Because of the peak prices of 1920, B thinks that V ought to pay $12.50 per day. Do the circumstances stated show an agreement as to wages? Is there any action that B can take against V? What kind would be the most severe? Could a mechanic's lien be enforced, and who would pay the cost of same? Could B close V's business for a day or longer? Who would be obliged to stand the costs? —G. B., New York.

There is no room for doubt as to the law applying to this case. The main trouble in getting at the merits of B's claim is to ascertain the facts as to the mutual understanding between V, or what they should have understood when the work was actually commenced.

When V asked what B would charge for the work and B replied that he was getting $10 a day and expenses that amounted to an agreement that that was what would be charged. And we believe that, under the circumstances, B was bound to notify V that he wanted more money, if he was not willing to proceed at a rate of $10 a day and expenses after the work had been delayed several months. B's crediting the $225 payment as covering 18 days' work does not bind V unless V was notified of that fact and made no objection. We believe that if the $37.50 which B has been overpaid (on a basis of $10 per day) covers or substantially covers his actual and reasonably necessary expenses for board, carfare, etc., he had better drop his claim. But on the facts presented he is entitled to full payment of $10 per day, plus such expenses.

The time for filing a mechanic's lien has long passed, and there is no way whereby B can enforce closing of any part of V's business, excepting as he may first obtain judgment and have legal process issued under it against V's property. Should B get judgment he would get costs with it, but would have to arrange with his attorney for the payment of the latter's fee.

On the facts stated we advise against litigation.



In an interesting Texas case it appeared that a written contract for the construction of a cottage provided on its face that the owner should pay $990, but it was verbally understood that the real price should be $1,078. This arrangement was made because the owner's father, who was providing the necessary funds, had refused to pay more than $990. In denying the builder's right to recover the extra $88, the Texas Court of Civil Appeals said: "No one could rely upon written contracts if they could be contradicted and destroyed by the oral testimony of the parties thereto."

A Michigan contract for installation of a hot-water heating apparatus contained a clause in which the contractor warranted that the plant would warm rooms to a temperature of seventy degrees in zero weather, and nothing was specified in this written agreement concerning any improvements to be made by the owner to facilitate heating. It was therefore decided by the Michigan Supreme Court that the contractor could not etsablish a verbal qualification of the warranty by setting up a claimed understanding with the owner that the latter would build a stone foundation under the house.

An Illinois builder, who bound himself in writing to construct ornamental coping on a building, was denied the right to set up an oral understanding before the contract was signed that cornice molding might be substituted. And in a similar case the Illinois Supreme Court said: "If the specifications were attached to the contract at the time appellees executed it, then it matters not what previous understanding or arrangement existed; all prior or contemporaneous agreements were merged in the contract as executed."

Since the specifications covring construction of a house distinctly required the builder who constructed the brickwork to make a fireplace, the Massachusetts Supreme Judicial Court ruled that he could not show an oral understanding to the contrary. And the Kentucky Court of Appeals, applying the same principle in favor of a builder decided that he hav-

This Beautiful $2.00 PORTFOLIO of Wood Panels FREE to BUILDERS

This beautiful portfolio shows on various woods the many beautiful effects obtainable with Johnson's Perfectone Undercoat and Enamel, Johnson's Wood Dye, Johnson's Paste Wood Filler, Johnson's Prepared Wax, Johnson's Floor Varnish, Sani-Spar, Varnish Stain, etc.

Every portfolio costs two dollars, so we can't afford to send them out generally, but we are glad to furnish them gratis to contractors who use Johnson's Artistic Wood Finishes in their work.

The attached coupon will bring you the portfolio promptly, all charges prepaid. You will find it very convenient to show clients and prospects the effects you can give them with Johnson's Artistic Wood Finishes.

JOHNSON'S WOOD DYE

With Johnson's Wood Dye soft woods can be finished so that they are as beautiful as hard wood. Johnson's Wood Dye is very easy to apply—goes on easily and quickly without a lap or streak—penetrates deeply—brings out the beauty of the grain without raising it—dries in four hours—and does not rub off or smudge.

Three Johnson factories are operated under ideal working conditions—full force—full time—no reduction in wages—an eight hour day—ten days' vacation on full pay—full pay during sickness—liberal pension and bonus systems. This policy can be continued only if artisans will co-operate by insisting upon the JOHNSON brand.

ing constructed a house according to his written agreement, the owner could not rely on any verbal agreement that a stairway should be wide enough to admit the passage of a piano and a bookcase.

In another Massachusetts case, the Supreme Judicial Court adjudged that a builder could not demand extra compensation for furnishing certain ornamental balconies called for by the plans and specifications which were made a part of his written contract, by relying upon a claimed oral understanding that the contract price should not include the balconies. And a Missouri builder was denied recovery of interest on a deposit made to secure performance of his contract, because there was no written stipulation for interest, although he sought to show that there was a verbal understanding to that effect.

Where it appeared under a Connecticut contract that a building was to be constructed for a lump sum, the Supreme Court of Errors of that commonwealth held that the owner could not show an oral contract that the price should cover a verbal guaranty that the architect's plans would prove satisfactory to the owner.

A New York court has declared that a clause in a building contract against subletting of the work could not be contradicted by proving a verbal agreement to permit subletting. And the Louisiana Supreme Court has gone so far as to hold that items of extra work could not be shown to have been performed under verbal agreement, where the written contract provides against claims for extras not covered by written authority.

But, illustrating an exception to the general rule, to the effect that where a written provision is not specific, there may be proof of a mutual verbal understanding, the New York Supreme Court has ruled that where a building contract in wiring required the builder to furnish a "storm door with fancy embossed glass," the owner might prove a verbal agreement that the door should contain oval glass.

By analogy to the rule applying to verbal agreements offered to contradict written agreements, there is a similar principle which forbids proof of customs and usages in the building trade which tend to contradict special written contract provisions. So, the Michigan Supreme Court

How Is This Contractor to Collect His Pay?

BROWN'S property which he leases to the T. Company for ten years with the right to make improvements. After two years the company subleases to the H. & T. Company for eight years. V., president of the H. & T. Company, employs a contractor to make a twelve-foot addition to a building on the premises. On starting of the work V. directs that the addition be extended to 25 feet. V. explained to the contractor that he would finance the work personally, without drawing on the H. & T. Company. V. gave his personal notes for $1,000 to apply on account, and a total bill of $2,200, plus $400 extras, remains unpaid. In the meantime the T. Company has resumed possession, ejecting the H. & T. Company for non-payment of rent. Before such taking of repossession, however, the contractor filed a lien against the property in the name of V. V.'s notes have gone to protest.

"Who is the contractor to collect from? Is the T. Company liable?"—J. W. D., New York.

We are afraid that the contractor is "left holding the sack," excepting as he may be able to enforce personal judgment against V. We see no ground on which T. Company can be held. It is possible that lien might have been filed against the leasehold interest of the H. & T. Company on a theory that V. acted as its agent. But that recourse would have been avoided by the termination of the leasehold for non-payment of rent. Furthermore, the contractor appears to have looked wholly to V, as is indicated by his taking the notes from him and filing a lien in the name of V. We suggest that the contractor place his claims in the hands of some energetic attorney if there is any likelihood of V being good for judgment.

Wife's Acquiescence in Husband's Contract

WHEN an improvement is to be constructed on land owned by a married woman in her own right, or jointly with her husband, she should be induced to sign the contract under which the improvement is to be constructed. Too much faith should not be pinned to her husband's authority to contract on her behalf. Disregard of this suggestion may lead to annoying and expensive litigation should the wife attempt to evade personal liability or to ward off a mechanic's lien, to say nothing of the possibility of her succeeding in such a defense.

But those who have omitted to secure a wife's signature to a contract affecting her property will be interested to know that her acts may be taken as evidence of authorization or ratification of her husband's contract.

Statement of the Ownership, Managament, Circulation, Etc., Required by the Act of Congress of August 24, 1912.

Of Building Age and The Builders' Journal, published monthly at New York, N. Y., for April 1, 1922.
State of New York } ss.:
County of New York }

Before me, a Commissioner of Deeds, in and for the State and County aforesaid, personally appeared C. G. Peker, who, having been duly sworn according to law, deposes and says that he is the editor of the BUILDING AGE AND THE BUILDERS' JOURNAL, and that the following is, to the best of his knowledge and belief, a true statement of the ownership, management (and if a daily paper, the circulation), etc., of the aforesaid publication for the date shown in the above caption, required by the act of August 24, 1921, embodied in section 443, Postal Laws and Regulations, to wit:

1. That the names and addresses of the publisher, editor, managing editor, and business managers are:
Publisher—Building Age Publishing Corporation, 912-920 Broadway, New York City.
Editor—C. G. Peker, 912-920 Broadway, New York City.
Managing Editor—C. G. Peker, 912-920 Broadway, New York City.
Business Manager—David Meyers, 912-920 Broadway, New York City.

2. That the owners are:
Building Age Publishing Corporation, 912-920 Broadway, New York City.
That the stockholders owning or holding one per cent. or more of the total stock of Building Age Publishing Corporation are as follows:
B. A. & C. P. Holding Corporation, 1 Madison Avenue, New York City.

3. That the stockholders owning or holding one per cent. or more of the total stock of B. A. & C. P. Holding Corporation are as follows:
Frank Meyers, 912-920 Broadway, New York City; David Meyers, 912-920 Broadway, New York City; W. H. Parsons, 912-920 Broadway, New York City; W. A. Bardgett, 912-920 Broadway, New York City; M. & S. Meyers, 1 Madison Avenue, New York City; George Meyers, 1196 First Avenue, New York City; Michael Miller, 794 St. Nicholas Avenue, New York City; David L. Short, Columbia avenue and Hancock Street, Philadelphia, Pa.; G. Friedman, 627 Broadway, New York City; A. Cowen & Son, 34 West 25th Street, New York City; John J. Robbins, 276 Fifth Avenue, New York City.

4. That the known bondholders, mortgagees, and other security holders owning one per cent. or more of total amount of bonds, mortgages or other securities are:
Architectural and Building Press, 243 West 39th Street, New York City.

5. That the two paragraphs next above, giving the names of the owners, stockholders, and security holders, if any, contain not only the list of stockholders and security holders as they appear upon the books of the company but also, in cases where the stockholder or security holder appears upon the books of the company as trustee or in any other fiduciary relation, the name of the person or corporation for whom such trustee is acting, is given; also that the said two paragraphs contain statements embracing affiant's full knowledge and belief as to the circumstances and conditions under which stockholders and security holders who do not appear upon the books of the company as trustees, hold stock and securities in a capacity other than that of a bona fide owner; and this affiant has no reason to believe that any other person, association, or corporation has any interest direct or indirect in the said stock, bonds, or other securities than so stated by him.

CHARLES G. PEKER, Editor.

Sworn to and subscribed before me this 21st day of March, 1922.

[Seal] SADYE BLUMENFELD, Commissioner of Deeds. New York City, No. 23028.

Certificate filed N. Y. County, No. 78.

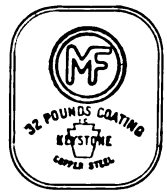
WEAR and *rust-resistance* are qualities of first importance—particularly for sheet metal used for roofing and construction purposes. Keystone Copper Steel means better buildings. *It lasts.*

KEYSTONE
COPPER STEEL



Superior in Service— Reasonable in Cost

The increased life of steel when alloyed with copper is a well established metallurgical fact. Time and weather tests have proved it to be best for both builder and owner.

Use Apollo-Keystone Galvanized. Shall we send new Weight Cards and Apollo Calendar?

For roofing, siding, gutters, spouting, eaves trough, sheet metal and tin work, use KEYSTONE quality Galvanized Sheets and Roofing Tin Plates. Sold by leading metal merchants. It assures satisfaction.

Write for booklets describing Keystone Copper Steel Sheets, Formed Products, and Terne Plates.

News, Notes and Comment

Money for Building Operations

THAT new building operations throughout the country may reach record-breaking proportions for the year is indicated by the tremendous amount of capital now being absorbed by the building industries, and the unusual demand for additional funds to be used for these purposes. S. W. Straus & Co., who are possibly the nation's largest lenders of money for new buildings, announce that since the first of January they have underwritten first mortgage building loans of $43,980,000, and that from inquiries for additional building loans now being received there is every indication that the nation is on the threshold of an era of unprecedented building activity. With regard to the building situation, S. W. Straus & Co., say:

"We believe building activities will proceed on an ascending scale as the season progresses. There is a good demand for funds with which to carry on new building operations, and the general fundamental conditions in the situation are now so nearly normal that since January 1st, have underwritten building loans amounting to $43,980,000 of which $26,510,000 was for apartment houses, $12,350,000 for office and loft buildings and $5,120,000 for miscellaneous structures. If the demand continues at the same rate, and fundamental conditions seem to so indicate, we shall be in a position to loan approximately $100,000,000 more to finance new building construction during the balance of the present year.

"That the present encouraging conditions are nationwide in character is indicated by the widely scattered range of these financial underwritings which includes loans in fourteen cities and thirteen states as follows: New York, Chicago, Philadelphia, Boston, Atlanta, Detroit, Fort Worth, Cleveland, Birmingham, Dallas, San Francisco, Kansas City, Seattle, and Portland, Ore.

"It is to be noted that labor conditions in the building industries are better than have been observed for some time and that prices of materials have reached a condition of stability. The tendency in building material costs, in fact, is toward higher levels which may be expected to continue as building operations expand. There is also a growing appreciation of the fact that permanent improvement can best be brought about through the natural and normal channels that have built up our great American cities.

"The immense amount of new building operations now getting under way throughout the country will have a helpful effect on general business and the unemployment situation, so that the large construction gains now being accomplished will, we are sure, prove the forerunner of more prosperous times."

Book Notices

Perry Lumber Reckoner; a book of 106 pages; pocket size; published by Benjamin L. Jenks, Cleveland, Ohio. Price, $1.50.

Everyone in the building trade has had the need of finding out how many board feet in a certain number of pieces of a certain size and certain length. To do this with the ordinary rule for figuring board measure, would, of course, take a good deal of time, and that is where this book is a decided, practical help, as it gets right down to accurate examples and gives the answer.

In its 106 pages of condensed reading matter it contains an immense amount of useful information, tables and matter regarding different size timber. It renders answers to nearly every question that has to do with the figuring of lumber. It certainly will be a big help in estimating.

Its size, 3½ x 6¼, enables it to be carried in the pocket or in the pigeonhole of the desk.

Columns — A treatise on the strength and design of compression members, by E. H. Salmon; 279 pages; published by Oxford University Press, New York.

This is rather an exhaustive treatise on the strength of columns and other compression members. The book contains quite a good deal of excellent information for the advanced student of strength of materials. It contains a bibliography of the different books on the subject that have been published, which will be quite an aid. While very excellent, we believe that it would meet more with popular approval if some of the higher mathematics were eliminated. Unless one has a good working knowledge of calculus, besides geometry and trigonometry, the book would be of very little value.

Success Through Vocational Guidance. By James McKinney and A. M. Simons. Published by the American School, Chicago, Ill. Price, $2.

Here is an interesting bok of 270 pages which contains some pertinent remarks on the choice of a life work. Its aim is to be a guide on how to choose wisely the line of business or profession best suited to one's abilities. An analysis can be made of one's own abilities, which will be a guide in this direction. The book contains some very interesting information and some really practical and helpful advice that will aid a young man in picking out a proper vocation.

Germs Pass Through Cistern Filters

CISTERN water that is used for drinking should be gathered with great care. Properly constructed cisterns that receive rain water from roofs generally afford good drinking water, but water of doubtful quality that is stored in cisterns is of course not safe for domestic use. According to the United States Geological Survey, Department of the Interior, most of the filters that are used in connection with cisterns do not remove the germs of disease, though they may make the water clear and apparently safe. Many cisterns are divided into two compartments by a brick wall, the water being admitted into one compartment and pumped or drawn from the other after it has passed through the wall. The passage of the water through the brick improves it in clearness and color but not generally in sanitary quality.

100 PER CENT PERFORMANCE OF BRASS PIPE

That was the significant result of a survey of hot water service in more than 100 apartment houses containing 1000 apartments

You Can't Argue with a Piece of Pipe

¶ When one of your men doesn't come up to your standard of good work, a little coaching produces the desired results.

¶ But you can't argue with a piece of pipe. All the persuasion in the world won't add a single hour to its allotted span of life.

¶ Pipe and pipe fittings represent only about 10 per cent of the cost of the plumbing installation, yet this relatively small item absolutely measures the useful life of the job.

¶ Brass pipe and pipe fittings—which, for hot water, add only about ⅓ of 1 per cent. to the cost of a building, and for both hot and cold water only ⅔ of 1 per cent.—give a length of service far out of proportion to their cost. For Brass *permanently* resists rust.

¶ Good plumbing deserves good pipe. Brass is the thing.

Millions of people are now being told the facts about *the permanence of Brass* in the Saturday Evening Post and the Literary Digest. ¶ Many of these millions of readers of our advertisements are doing business with you. ¶ You can sell them Brass—and, by thus giving them a better job, keep their business, and get their friends' business, too.

"Brass is cheaper because you pay for it only ONCE."

Trend of Material Prices

THE following are wholesale prices of basic building materials in the three markets which set prices for the rest of the country.

These prices are presented to show the trend of the wholesale market, which forecasts prices in the retail market. They are not prices which the average contractor can buy at, but are quoted to show him the movement of materials so that he can buy to better advantage.

Followed in conjunction with the Review of Building Conditions, these prices will prove invaluable.

All prices are for carload lots, F. O. B. market quoted, unless otherwise noted.

BUILDING MATERIALS

GUMLASTIC—The Best Protective Roof Coating on the Market

It toughens and callouses with age. It will not dry out, peel or crack. It is a scientific combination of pure asbestos, gums, waterproof lacquer, and non-volatile oils. It is unaffected by the severest cold or most intense heat—fireproof and rotproof.

Contractors can make big profits coating leaky roofs with Gumlastic roof coating. A gallon covers from 50 to 75 square feet. It is a perfect coating for burlap, canvas, tar and gravel, concrete, felt, iron, tin and steel roofs. You can save your customers money by coating their roofs with Gumlastic.

Review of Building Situation

MARCH building statistics just published by F. W. Dodge & Co., show conclusively that 1922 will be the banner year of the building industry. According to these figures the total amount of contracts awarded, not contemplated, amount to the immense sum of $293,636,500! Of this amount $121,550,900 is to be spent for residential construction and $81,733,700 of this in the New England, New York and Middle Atlantic districts. Of course, these districts comprise the principal Eastern cities in which there is a considerable shortage of houses.

In New York City alone there has just been passed a bill which allows insurance companies to invest a certain amount in house construction. The Metropolitan Life Insurance Company intends to invest one hundred million dollars in residences, which shows that at the present time a tremendous amount of money is available and now being spent to relieve the housing shortage.

Even from the March figures, New York City establishes an unprecedented record; its March valuation being over one-half of its total valuation for the first three months of this year. In the Mid-West territory a steady growth is noticed but unfortunately there are some labor disturbances which prevent of as much activity as was to be expected from that locality.

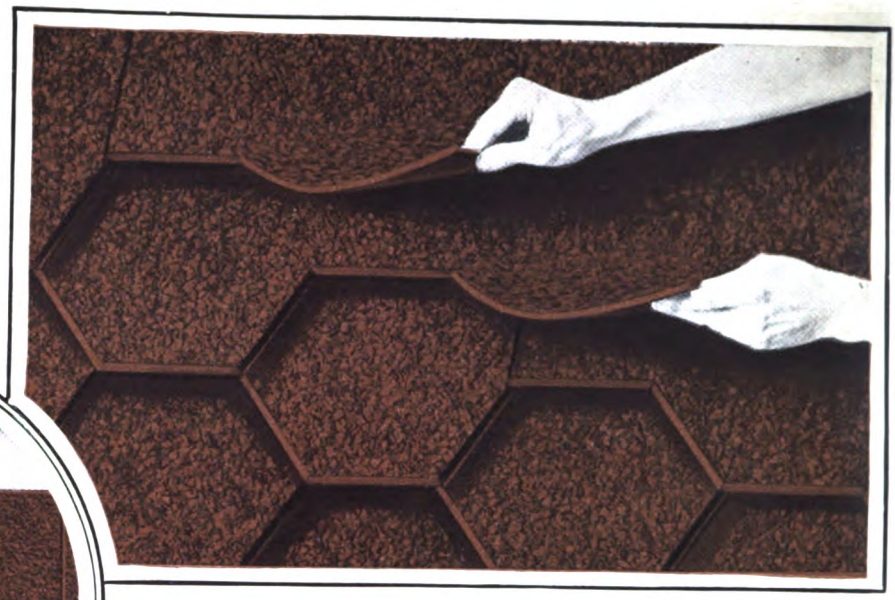
On the Pacific Coast, Los Angeles still leads in activity, the March business there being the largest on record.

In the Middle Atlantic District the total contracts awarded for March nearly totals the sum of its combined January and February business. A large number of speculative builders are now operating around Philadelphia and Baltimore on a large scale.

It is to be noted that there is also quite an increase in the contracts for industrial buildings. This is another good sign of the times. Today construction is more active than any other industry and the contractor and material men are bound to make some money this year.

These figures of contracts awarded show a valuation of 98 per cent. greater than in March, 1921, and practically equal to the record-breaking figures for January and February of this year.

The figures given include 11,066 separate buildings for residential purposes. 6,902 of these residences are to be built in the New England, New York and Mid-Atlantic District alone, or over 60 per cent. of the total homes are to be erected in this small section of the country.



Record of March, 1922. Building Contracts Awarded

Vulcanite Hexagon Slab

Double thickness means double protection and double wear. First row completely backs up exposed area of third row. Automatically spaced. Read about this great patented specialty below.

Vulcanite Self-Spacing Shingles

Laid according to instructions, Self-Spacing Shingles build a roof with three thicknesses everywhere except at slot. Each shingle fits snugly against shoulder of next one. Rain and snow can't drive into roof boards. Write our nearest office for samples in standard and jumbo weights, Indian red or gray-green.

The Complete Vulcanite Line Includes

- Standard Individual Shingles
- Self-Spacing Individual Shingles (Standard and Jumbo Weights)
- Hexagon Slab Shingles (Standard and Jumbo Weights)
- Doubletite Slab Shingles
- Four-in-One Slab Shingles
- Slate Surfaced Roll Roofing (Standard and Jumbo Weights)
- Smooth Surfaced Roll Roofing (Talc, Mica and Sanded Finishes)
- Ornamental Roll Roofing
- Vulcanite Built-up Roofing

Our line of deadening felts, cements and roofing paints is also complete and includes an item for every use.

There's a Big Need For the Patented Hexagon Slab

VULCANITE Hexagon Slab is distinctive, exclusive and of the highest possible quality, both in design and manufacture. It fills a specific need in the roofing business.

Considerably wider than ordinary slab shingle, insuring double thickness at every point.

Patented design automatically determines exact location and weather exposure of each shingle. Incorrect application impossible. No necessity for marking off roof.

Double butt makes a more artistic roof, casting an unusually heavy shadow. Distinctive tile pattern.

Can be applied directly over old shingles. Many dealers have developed a highly profitable business for this use alone.

The Self-Spacing Shingle shown at left is another great patented Vulcanite specialty that furnishes better protection because of extra thickness and perfect sealing.

THE VULCANITE ROOFING COMPANY

(Roofing Division of The Beaver Board Companies)

VULCANITE QUALITY FOR BETTER ROOFS

Digitized by Google

The light gray indicates the all-over double thickness of Doubletite.

The triangular tab at the top of each slab underlies the slots in the second course above, giving added protection just where it is most needed. This is an exclusive, patented Vulcanite feature.

Dark spots in this X-Ray view of Doubletite denote triple thickness.

Doubletite Is Double Thick

BUILDS a double thick roof at every point—triple thick in vital spots. No other medium priced slab shingle does this.

The widest 4 in 1 shingle made—12 inches. It's also the heaviest—and handsomest. Won't curl in any climate.

Lay four at a time. Automatic spacing. Can't go wrong in application.

No other shingle is made like Doubletite. *It is patented.* No other shingle *can* give its important advantages.

Here's a point to remember—you men who specify, handle or lay roofings. In addition, the Vulcanite line includes *a better roofing for every possible need.* See list on other page.

And bear this in mind: No matter where you are located, we can promise *quick delivery and low freight rates.* Factories at Albany, N. Y., Franklin, O., Anderson, Ind., Chicago, Kansas City and San Francisco. Also conveniently located warehouses.

We will gladly send one of our large force of roofing experts to your office to explain the Vulcanite line and our proposition in detail. Drop a card to our nearest office. Also, at your request, we will send you full-sized samples of Doubletite, Hexagon, Self-Spacing Shingles or any other Vulcanite Roofing.

Ideal Wall Construction In Over 100 Communities

Although Ideal wall construction has been promoted only during the past year, it has been adopted in over 100 communities. Builders in general have been quick to appreciate its merits. It's fast becoming the prevailing construction for residences.

It has been approved by building experts, architects and engineers. More than 100 cities have adopted it; codes have been amended to permit it. It offers you opportunities possessed by no other form of home building.

Home buyers are attracted by the inviting and pleasing appearance of the Ideal wall homes. Such homes are thoroughly dry, well ventilated and fire-safe. The Ideal wall is the strongest hollow wall ever conceived—there are 2¼ inches of solid material at its thinnest point. A strong, durable, sanitary construction for residences, two-family houses, apartments, or garages.

These Books Will Help You Land Jobs

"BRICK—How to Build and Estimate" is the third edition of this practical building manual. It is practically all new material. This book is packed full of good, useful building information. Describes fully Ideal wall construction. Estimating tables, detail drawings, tests of material. Covers brickwork thoroughly. 25 cents prepaid.

Another book you should have is *"BRICK for the Average Man's Home."* This contains 35 small brick house designs. *You can secure working drawings for all of these designs at small cost.* $1.00 postpaid.

The very nominal price of these books is made to cover cost of printing and distribution only. Every builder should have them. They are the most practical books on brickwork ever written. Send $1.25 to the Common Brick Industry of America, 1308 Schofield Building, Cleveland, and get both books.

"I Have Tried it Out!"

FRANK C. KITSON · MECHANICAL ENGINEER · SAN FRANCISCO · CALIFORNIA

HOBART BUILDING

Oct 8th 1921.

The Common Brick Industry of America,
Cleveland, Ohio.

Gentlemen:-

The idea of the IDEAL wall is the finest thing that has come to lovers of brick construction in years. Now we can have our long wished for brickwork at the cost of frame construction.

I have tried it out thoroughly merely to satisfy myself and now that the trial is over, I am more of an enthusiast.

Have you some standard details that you recommend? I am particularly interested detail showing where the floor joists rest on walls for small two story dwellings.

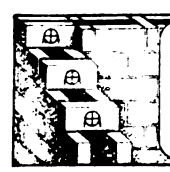
Yours very truly,

FCK/CR

The Ideal All-Rolok Wall is laid in the attractive Flemish bond and is just as good looking as it is substantial.

This Trade-Mark Stands for—

Quality—
An honest product, honestly advertised.



Responsibility—
A reputation for honorable, prompt and efficient business dealings.

Service—
A material of proven integrity with a record of ages of service.

Books That Will Increase Your Profits

Carpentry and Building Construction

Hick's New Builders' Guide

This standard book has just been revised and brought thoroughly up-to-date by the addition of much new material. It authoritatively covers masonry, hollow tile, estimating, roof framing, etc. Recommended by experienced men as the best modern text book for apprentices and journeymen. Full of practical "short cuts." A section of the book is devoted to tables which save considerable time that otherwise would be spent in lengthy figuring.

Contents by Chapters: Layout of Site. Excavating, Sheet Piling and Pumping. Shoring and Underpinning. Stone Masonry. Waterproofing Foundation Walls. Concrete Construction and Forms for Concrete Footings and Foundation Walls. Brickwork. Hollow Tile, Construction and Costs. How to Do Stucco Work on Metal Lath, Brick and Wood Lath. How to Lay Out and Build Fireplaces. Chimney Design and Construction. House Framing, Roof Framing. Mitering Planceers, Mouldings, etc. Carpentry and Construction Kinks. Metal Ceilings and Walls. Estimating Quantities of Materials. Estimating Labor on Carpentry. Estimating Brickwork. Short Cuts in Estimating Forms, etc. Miscellaneous Tables. 360 pages, 4½x7 inches, 300 figs. Flexible fabrikoid $3.00

Kidder's Building Construction and Superintendence

Part I. Mason's Work. This new and enlarged edition has been thoroughly revised and rewritten. It presents the latest and best modern practice in masonry construction. Special attention has been given to fireproofing and concrete, both reinforced and plain. The chapters on these subjects are new. Foundations also receive careful consideration, and examples of the latest and most approved work in recent structures on difficult soils are shown. 966 pages, 7x9¾ inches, 628 illustrations. Cloth.....$7.00

Part II. Carpenters' Work. This part has also been completely revised and rewritten. The book has been extended in scope to meet the improvements that have been made in construction methods during the period since it was first published. 931 pages, 830 illustrations, 7x9¾ inches. Cloth....$7.00

Part III. Trussed Roofs and Roof Trusses. Describes nearly every type of roof construction commonly met with in buildings, wooden and steel trusses for different spans and building requirements, computing the loads, drawing the stress diagrams, proportioning the members and joints to stresses, etc., etc. 294 pages, 306 illustrations. Cloth.....$3.50

Kidder's Architects and Builders Pocket Book

Everyone in the Building field uses "Kidder's Pocket Book" and this new edition is larger and better than ever. Prof. Nolan and the other authorities, who have worked with him in the revision and rewriting of the various chapters, have described the latest improvements in the methods and equipment.

They have quoted from many authentic sources as well as giving results obtained in their own daily practise. Every item has been carefully checked and rechecked to see that it is technically correct and the aim throughout has been to present clearly and concisely, and in the least possible space, all the information that is likely to be required by the architect, builder, structural engineer, draughtsman, or contractor, including data for estimating the approximate cost.

The New Kidder has 1900 pages of text, over 1,000 specially prepared diagrams and numerous tables. It is furnished in an attractive flexible binding with gold edges. Price.....$7.00

Cosgrove's Hollow Tile Construction

A practical explanation of modern methods of designing and building fireproof residences of hollow tile, written so the builder may use it, with chapters on walls, floors, roofs, partitions, framework, estimating, photographs and floor plans of finished structure, etc. 256 pages, 4¾x7 inches, 145 figures, 70 plates, flexible fabrikoid.....$2.50

Crussell's Jobbing Work for the Carpenter

Practical instructions on odd jobs which the carpenter is called upon to execute in the way of repairs or remodeling.

Contents: Tools and Workshop Equipment. Cutting Doorway Through a Partition Wall. Store Counters, Making a Cash Till. A Small Bookcase. General Repairs. Taking Measurements. Making a Four-Paneled Door. Window Frame Construction. Show Case Construction. Cabinet Hardware. Design and Construction of Roll Top Desk. Making a Drawing Board. Picture Framing and Kindred Subjects. Crating Furniture and Household Goods. Curved Work Saw Kerfing, etc. Contractors' Ladders. Design and Construction of Fences. Shop Kinks. The Shop Doctor. 273 pages, 6x9 inches, 270 figs. Cloth $2.00

Estimating and Specification Writing

Arthur's Estimating Building Costs

A book giving short-cuts for estimating materials, output of labor and costs for all kinds of building work. The tables are especially reliable. The special value of this book is in the splendid collection of labor and material data. This is given in hours and quantities and examples are worked out on a basis of $1.00 an hour.

The book begins with the excavation, and ends when the house is finished. The chapters are: Excavations and Piling, Concrete, Brickwork, Stonework, Plastering, Metal, Roofing, ainting, Plumbing and Heating, Miscellaneous includes Hardware, Electric Wiring, Tiling, Bonds, Tables, Rafters, Cisterns, Weights, Comparisons of Cost Between Brick and Frame Buildings; Hints on Drawings. 228 pages, 4½x7 inhces, 29 figs., 91 tables. Cloth, $1.50

Joslin's Estimating the Cost of Buildings

A systematic treatise on factors of costs and superintendence written for Eastern conditions with important chapters on plan reading, estimating the cost of labor and materials and a splendid system for keeping track of the progress of the work. 205 pages, 6x9 inches, illustrated. Cloth $1.25

Hick's Estimators' Pocket Companion

A guide to prices of all kinds of building materials with handy rules, tables and information for the estimator.

The chapter on Carpentry gives the number of board feet and cost of framing lumber per square of 100 sq. ft., and many valuable tables, including timber measure, common and hip rafters for roofs of various pitches and with from one to eighteen feet run, the safe bearing loads of timber and yellow pine posts. Reliable data on figuring the strength and weight of materials is also given.

Contents: Introductory. Preparing Estimates. Excavating. Stone Work. Plain Concrete. Reinforced Concrete. Concrete Cement Stone. Cellar Bottoms and Walks. Brick Work. Hollow Building Tile. Masonry Tables. Estimators' Guide. Plastering. Carpentry. Iron Work. Sheet Metal and Roofing. Plumbing. Heating and Ventilation. Electrical Work. Tile Work. 218 pages, 4x6 inches, 92 tables. Cloth.....$1.00

Joslin's Handy Estimate Blanks

Designed for use by Building Contractors in estimating dwellings, small apartment houses, stables, garages, small public and semi-public buildings. A great time and labor saver in computing cost. 32 pages, 7x10 inches. Paper.....$0.25

Emerson's Modern Building Superintendence and the Writing of Specifications

It covers details of the very newest building methods and modern materials, steel skeleton construction, steel beams, reinforced concrete, plumbing, electric lighting, vacuum cleaning, etc., etc. The author takes a fine modern business building of twenty stories high and, beginning with the excavation, covers every detail of construction until the building is completed. In the second part of the book he deals with the writing of specifications. A careful and accurate and clear writing of specifications involving a knowledge of materials and matters of construction is an essential in the equipment of every young architect. 247 pages, 4¼x7 inches. Cloth. Price.....$1.75

Hick's Specification Blanks for Frame or Brick Buildings

It pays to have definite specifications covering all details of the work when preparing your estimates. These new blanks are arranged to cover all the work apt to be called for in erecting residences, churches, schools, and other small public buildings in various sections of the country. All the user has to do is insert his sizes, quantities, etc., and cross out what he does not want. Plenty of space is left at the end of each specification for extra data. 8 pages, 7x10 inches. Paper.

20 cents each; 6 for $1.00

The Century Clock Face Job Ticket

A new form for keeping track of time spent on different jobs. All the mechanic has to do is check off the time he started on the clock face and then mark off the hour and minute when he quits.

It simplifies the control of labor-time and job-cost. Insures the proper charge of labor cost to each job. Shows elapsed time and hour of day when work was done. Gives labor cost of the different operations. Eliminates illegible writing on the part of the worker. Requires no clock stamps or other recording devices. Supplied in pads of 250 tickets 4x7 inches all ready for use. 500 for $2.75—1000 for $4.25. 5000 for $16.00.

ANNOUNCEMENT

While this is a new organization, over twenty years' experience in publishing and selling mechanical books is at your service. The management and stockholders include men who are nationally known as authorities in the building and allied trades.

BRICK

American Face Brick Association, 110 South Dearborn St., Chicago, Ill.

15. *The Story of Brick.* Contains the history of, and basic requirements of building brick, artistic, sanitary and economic reasons, comparative costs, and fire safety with photographs and drawings, and illustrates ancient and modern architectural works of note in brick. Sent free.
16. *A Manual of Face Brick Construction.* The history of brick making, types of face brick, showing details of construction for walls, chimneys and arches. Details of use of tile and brick construction and different types of bonds are given. A series of plans and elevations of small brick houses, descriptions, useful tables and suggestions and illustrated and described. Size 8½ x 11 in. 116 pp. Price $1.00.
17. *The Home of Beauty.* A booklet containing fifty prize designs for small brick houses submitted in national competition by architects. Texts by Aymar Embury II, Architect. Size 8 x 10 in. 72 pp. Price 50 cents.
18. *Architectural Details in Brickwork.* Three series of beautiful half-tone prints of brickwork detail, contained in closed folders suitable for standard vertical letter file. The three series contain 124 prints in all. Size 8½ x 11 in. Price $1.50 per set.

Common Brick Manufacturers' Association of America, 1309 Schofield Bldg., Cleveland, Ohio.

19. *Brick—How to Build and Estimate.* 3rd edition, 32nd thousand, a manual of solid brick and Ideal wall construction. Contains data on the strength of brickwork, on mortars, bonds and joints and equipment, and contains complete estimating tables for quantities of brick, mortar, material and approximate mechanics' time for various thicknesses and square foot areas of solid and Ideal wall. 8½ x 11 in. 72 pp. Price 25 cents.
20. *Brick for the Average Man's Home.* Book. 8½ x 11 in. 72 pp. Color plates. Book of plans for bungalows, houses and apartments for which working drawings are available. Price $1.00.

Fiske & Company, Boston, Mass.

245. Tapestry brick, other grades of front brick. Manufacturers of "Fisklock" Brick.

BUILDING CONSTRUCTION—See also Garage Construction

National Manufacturing Co., Sterling, Ill.

Truscon Steel Company, Youngstown, Ohio.

21. *Truscon Floortype Construction.* Form D-352. Contains complete data and illustrations of Floortype installations. 16 pp. Ill. 8½ x 11 pp.
22. *Truscon Standard Buildings.* Form D-398. Describes Truscon Standard Steel Buildings, with diagrams, illustrations of installations, descriptive matter and list of users. 48 pp. Ill. 8½ x 11 in.
23. *Truscon Building Products.* Form D-376. Contains a brief description of each of the Truscon Products. 112 pp. Ill. 8½ x 11 in.
24. *Modern School Construction.* Form D-395. Contains illustrations of schools, with typical elevations, showing advantages of Truscon Products for this construction. 16 pp. Ill. 8½ x 11 in.

Workmen spreading cement roof on Metal Lath supported by Steel Joists resting on ***Structural Steel Truss***

Build Garage Roofs and Floors Firesafe with National Steel Joists

AMERICA is dotted with garages built with National Steel Joist firesafe roofs and floors. The ease and speed with which such roofs and floors can be constructed make this a most economical and popular type of construction.

National Steel Joists are also used in building firesafe floors and roofs in office buildings, hotels, schools, stores, public buildings, hospitals, theatres and residences.

National Steel Joists and also National Rib Lath are carried in stock in leading cities. Delivery is made promptly. The joists are delivered to the job cut to meet plans. Write for joist sizes, weights, safe loading tables, etc.

SELECTED LIST OF MANUFACTURERS' LITERATURE—*Continued from page 84*

Koehring Company, Milwaukee, Wis.
38. *Concrete—Its Manufacture and Use.* Book. 4½ x 7 in. Illustrated. 207 pp. Comprehensive discussion from the practical standpoint of concrete.

Lehigh Portland Cement Co., Allentown, Pa.
40. *The Expense-Proof Farm.* Book of 96 pp. Illustrated. Showing methods of constructing various buildings, fence posts, water troughs, etc., used about the farm.

CHAINS
Bridgeport Chain Co., Bridgeport, Conn.
29. *Catalog No. 14.* Contains 64 pp. Illustrated, of different chains that can be used in all parts of building construction.

CLAMPS
James L. Taylor Mfg. Co., Poughkeepsie, N. Y.

COLUMN AND BEAM COVERING
United States Gypsum Company, 205 W. Monroe St., Chicago, Ill.
39. *32-page booklet*, 8½ x 11. Pyrobar Tile.

COLUMNS
Hartmann-Sanders Co., Elston and Webster Avenues, Chicago, Ill.
233. *Catalog No. D-47.* 48 pages, illustrated. 7¼x10 in. Illustrating the Koll's Patent Lock-Joint Wood Columns.

CONCRETE APPLIANCES
Badger Concrete Mixer Co., Majestic Bldg., Milwaukee, Wis.
Universal Cement Mould Co., No. Milwaukee, Wis.
41. *Illustrated Folder* describing mold for building hollow concrete walls for homes, garages, barns, silos, etc.

Van Guilder Double Wall Co., 77 South Avenue, Rochester, N. Y.
42. *A Catalog* describing the Van Guilder system of portable forms for the building of hollow concrete walls on the thermos bottle idea for the erection of homes, ice houses, barns, silos, etc. Walls are dry, as there is continuous air space around entire building.

CONCRETE MACHINERY
A. S. Aloe Company, 513 Olive Street, St. Louis, Mo.
43. *Descriptive Illustrated Circular* of Magic Concrete Mixer.

The American Cement Machine Co., Inc., Keokuk, Iowa.
Concrete Equipment Co., 535 Ottawa Street, Holland, Mich.
Concrete Block Machine & Mold Co., 114 S. 2nd Street, St. Louis, Mo.
253. *Catalogue No. 38.* Describes Building Block Machines. It is a 40-page book, 6 x 10 in.
254. *Catalogue No. 5.* This is a new catalogue describing the Adjustable Steel Culvert Forms. 8-page book 6 x 10 in.
255. *Catalogue No. 11.* This is a new catalogue describing the new Steel Burial Vault Molds. It is 8 pages, 6 x 10 in.

C. H. & E. Mfg. Co., 259 Mineral Street, Milwaukee, Wis.
Ideal Concrete Machinery Co., 1334 Monmouth Street, Cincinnati, Ohio.
Jaeger Machine Co., 216 Dublin Avenue, Columbus, Ohio.
Koehring Co., Milwaukee, Wis.
46. *Koehring Construction Mixers.* Booklet. 7¾ x 10½ in. Illustrated. 96 pp. Complete information on construction type concrete mixers.
47. *Koehring Dandie Mixer.* Booklet. 6 x 9 in. Illustrated. 24 pp. Illustrating and describing Koehring line of Dandie light mixers.

Little Whirlwind Mixer Co., 438 Gould Street, La Crosse, Wis.
Ransome Concrete Machinery Co., 1774 Second Street, Dunellen, N. J.
Republic Iron Works, Box 602, Tecumseh, Mich.
Standard Scale & Supply Co., 1631 Liberty Avenue, Pittsburgh, Pa.

CONCRETE MARBLE
Art Stone Co., Waynesboro, Pa.
45. *Descriptive Circulars* with illustrations of different marbles in colors. Sent free to any interested party.

CONSTRUCTION, FIREPROOF
National Fire Proofing Co., 250 Federal St., Pittsburgh, Pa.
226. *Standard Fire Proofing Bulletin* 171. 8½ x 11 in. 32 pp. Illustrated. A treatise on fireproof floor construction.

National Pressed Steel Co., Massilon, Ohio.
United States Gypsum Company, 205 West Monroe St., Chicago, Ill.
48. *Pyrobar Gypsum Tile.* Booklet. 8½ x 11 in. 32 pp. Illustrated. Detail and specifications for fireproof partitions.
49. *Bulletins*, 8½ x 11 in. Containing details and specifications for Pyrobar voids for use with reinforced concrete joist floor construction; Pyrobar roof tile; and monolithic gypsum floors and roofs.

CONTRACT AND ESTIMATE BLANKS
L. Fink & Sons Printing Co., Laurel Springs, N. J.
166. *Catalog and Samples* of contract sheets, estimate blanks, job tickets, time sheets, wage receipts, etc., with prices.

DAMP-PROOFING
Amalgamated Roofing Co., 431 So. Dearborn Street, Chicago, Ill.
Asbestos Shingle, Slate & Sheathing Co., Ambler, Pa.
Cortright Metal Roofing Co., Philadelphia, Pa.
Illinois Zinc Co., 280 Broadway, New York.
National Sheet Metal Roofing Co., 339 Grand Street, Jersey City, N. J.
Rockwood Co., Van Wert, Ohio.
F. C. Sheldon Slate Co., Granville, N. Y.

DOOR CHECKS
Park Manufacturing Co., Worcester, Mass.
50. *Catalog* contains description of six models of the new improved Worcester-Blount Door Check.

DOORS AND WINDOWS
The Bogert & Carlough Company, 30 Peach Street, Paterson, N. J.
247. BOCA steel sash. (E-22). A catalogue containing designing information, complete details and tables, and illustrations of standard installations of sidewall sash, monitor sash, mechanical operators, steel doors, and steel partitions. 24 pages. Illustrated. 8½x11 in.

Hess Warming & Ventilating Co., 1201 Tacoma Bldg., Chicago, Ill.
Henry Hope & Sons, 103 Park Ave., New York.
51. *Hope's Casements and Leaded Glass.* Portfolio. Gives specifications, description and photo-engraving, of Hope Casements in English and American Architecture, full size details of outward and inward opening and pivoted casements, of residential and office types. Size 12¾ x 18½ in. 32 pp.

Truscon Steel Company, Youngstown, Ohio.
52. *Truscon Steel Sash.* This handbook has been prepared for detailers and specification writers. The descriptions are clear and the details are complete. 80 pp. Ill. 8½ x 11 in.
53. *Truscon Steel Sash.* A catalog containing designing data, tables and views of Stock Sash installations. 6 pp. Ill. 8½ x 11 in.

DOOR AND WINDOW FRAMES
Andersen Lumber Company, South Stillwater, Minn.
55. *General Catalog* for architects, contractors, engineers, carpenters or builders. Describes and illustrates fully Andersen Standard White Pine Window, Cellar Frames, Sash Frames and Door Frames. Gives details of construction, variety of sizes and uses for ordinary as well as special construction, and method of assembly. Size 7¾ x 10¾, 24 pages.
56. *Better Frames for Less Money* for consumers. Interesting folder showing advantages of Andersen Standard White Pine Frames. Uses, sizes and details of construction.

DRAFTING MATERIALS
A. S. Aloe Company, 513 Olive Street, St. Louis, Mo.
Keuffel & Esser Co., Hoboken, N. J.
Warren-Knight Company, 136 No. 12th Street, Philadelphia, Pa.

DUMBWAITERS
Kimball Bros. Co., 1106 Ninth Street, Council Bluff, Iowa.
Sedgwick Machine Works, 156 W. 15th Street, New York.
57. High grade Hand Power Elevators and Dumbwaiters for All Purposes. Illustrated catalog, 52 pages; dumbwaiter service sheet, and pamphlets descriptive of many special types of outfits.

Williamsport Wire Rope Co., Williamsport, Pa.

ELEVATORS
Kimball Brothers Company, Council Bluffs, Iowa.
58. *Kimball Elevators.* An illustrated catalog of hand power, sidewalk, and garage elevators and dumbwaiters and electric passenger, freight and push button elevators. 32 pp. Ill. 7¾ x 10½ in.

Richards-Wilcox Mfg. Co., Aurora, Ill.
59. *"Ideal" Elevator Door Equipment.* Catalog showing elevator door hangers for one, two and three speed doors, also doors in pairs and combination swing and slide doors. Door closers and checks. 24 pp. Ill. 8½ x 11 in.

Sedgwick Machine Works, 156 West 15th Street, New York.

FACTORY EQUIPMENT
The Edwards Mfg. Co., Cincinnati, Ohio.
60. *Edwards' Steel Equipment.* Illustrated catalog. Showing steel lockers and shelving for factories, offices, stores, schools and hospitals, together with illustrations and description of "Edmanco" steel office furniture and filing cabinets. Size 8 x 11 in. 32 pp.

FIREPLACES AND MANTELS
Apex Fireplace Co., Urbana, Ill.
Stover Mfg. & Engine Co., 747 Lake Street, Freeport, Ill.
Strait & Richards, Inc., Newark, N. J.
62. *Catalog* describing fireplaces, electric and gas logs, heating supplies, heaters, etc.

FLOOR HARDENERS
Truscon Laboratories, The, Cor. Caniff Avenue and Grand Trunk R. R., Detroit, Mich.
61. *Agatex and Its Performances.* Booklet. 8½ x 11 in. Describes the methods of hardening concrete floors by the application of a chemical which forms a new surface as hard as agate.

FLOORING
The Long-Bell Lumber Co., R. A. Long Building, Kansas City, Mo.
63. *The Perfect Floor.* Tells how to lay, finish and care for Oak Flooring. 16 pp. 14 Illus. 5½ x 7¾ in.

Oak Flooring Manufacturers Association, 1014 Ashland Block, Chicago, Ill.
64. *Modern Oak Floors.* Booklet. 6½ x 9¼. 24 pp. Illustrated. A general book that tells the complete story on Oak Flooring.
65. *Oak Flooring, How and When to Use It.* Booklet. 3½ x 6¼ in. 16 pp. Illustrated. A small, technical book showing the general rules, standard thickness and widths, how to lay, finish and care for oak floors.

Pacific Lumber Co., 2070 McCormick Bldg., Chicago, Ill.
United States Gypsum Company, 205 W. Monroe Street, Chicago, Ill.
66. *Gypsum Poured, Steel Reinforced.* Loose-leaf bulletins, 8½ x 11. Pyrofill.

Wood Mosaic Co., New Albany, Ind.
227. *Catalogue* of wood-carpet, strips, plain and ornamental parquetry, tongue and groove flooring in natural wood colors.

FLOORING, COMPOSITION
National Kellastone Co., 155 East Superior Street, Chicago, Ill.

FLOOR SURFACING
Amer. Floor Surfacing Machine Co., 521 So. St. Clair Street, Toledo, Ohio.
Wayvell Chappell & Co., 137 No. Jackson Street, Waukegan, Ill.
M. L. Schleuter, 223 W. Illinois Street, Chicago, Ill.

FLOOR VOIDS FOR USE IN CONCRETE
United States Gypsum Company, 205 W. Monroe Street, Chicago, Ill.
67. *Loose-leaf Bulletins.* 8½ x 11. Pyrobar Gypsum Floor Tile.

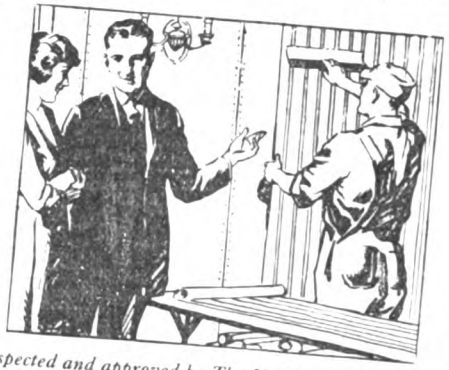
Sheetrock Takes Wallpaper Perfectly

Sheetrock walls and ceilings will take any decoration your customer wants—wallpaper, paint, calcimine or panels.

For Sheetrock is made from gypsum rock and, besides being fireproof, is non-warping, non-buckling and permanent.



Its patented edges butt together tightly and with Sheetrock Finisher insure uniformly smooth, flat surfaces.

It Saves Building Time. Sheetrock is made in broad, easily handled sheets, three-eighths of an inch thick. It saws like lumber, goes up quickly, and is immediately ready for the decorator. With Sheetrock, carpenters can build the walls complete.

Sheetrock Won't Leak Heat. Sheetrock walls are permanently tight and are highly insulating. They provide a cooler, more comfortable building in summer and a warmer, cheaper-to-heat building in winter.

It Safeguards Your Reputation. Whether used in new buildings or for lining attics and garages, for partitions in stores and offices and for other remodeling or repairs, you can be sure that Sheetrock will give enduring satisfaction.

Clip and mail the attached coupon for a sample of Sheetrock and our plan to help you get Sheetrock jobs.

Sheetrock is inspected and approved by The Underwriters' Laboratories, Inc.

Nothing to Interfere with Face Design

Especially Adaptable When Facing Is Placed After Plastering Is Done

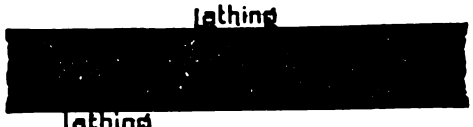
The vertical rod is adjustable to all conditions, and different margins from Lintel to Mantel Shelf.

The end of rod can be concealed if necessary or above shelf.

A real damper at a low price, and a set of working drawings to go with it.

APEX FIREPLACE CO.
URBANA, ILL.

Section of Outside Wall of House, Showing Wool Between Studding.



Mineral Wool for Building

Mineral Wool has superseded all other materials used for similar building purposes because it does "a great work at little expense." A house lined with Mineral Wool has an indestructible, fireproof and vermin-proof guard; it protects the entire household. In the winter time it keeps the cold air out, facilitating proper heating and economy in fuel. In the summer it keeps the heat out.

This material, being of fibrous, inelastic composition, acts as a deadener and muffles all sound. It is considered the best insulator material on the market, making it a perfect refrigerating machine.

Mineral Wool makes life-long friends of all its users. If you are skeptical as to its power, let us demonstrate. We can prove all claims. Write us to-day.

U. S. Mineral Wool Co.
280 Madison Avenue, New York
[Cor. 40th Street]

Section of Sound-Proof and Fire-Proof Partition. Can be used for outside walls also.

FISKLOCK

REG. U. S. PAT. OFF.

saves so much labor cost that you can build a house of first-quality face brick at approximately the cost of frame. A "Fisklock" brick is equivalent to a face brick and a common brick.

Write for booklet "Fisklock Construction." Every contractor should have it.

MORTAR—See also Cement

MORTAR COLORS

Clinton Metallic Paint Co., Clinton, N. Y.
118. *Clinton Mortar Colors.* Booklet. 3½ x 6¼ in. 8pp. Illustrated. Complete description of Clinton Mortar Colors with color samples.

PACKAGE RECEIVER

The Donley Bros., 3700 East 74th Street, Cleveland, Ohio.

PAINTS, STAINS, VARNISHES AND WOOD FINISHES

S. C. Johnson & Son, Racine, Wis.
122. *The Proper Treatment for Floors, Woodwork and Furniture.* Booklet. 6¼ x 8⅜ in. 32 pp. Illustrated in color. A treatise on finishing hard and soft wood in stained and enameled effects; also natural wood effects.
123. *Portfolio of Wood Panels.* 5½ x 10¾ in. 14 pp. A portfolio containing actual panels of finished woods. Also contains valuable information on finishing and re-finishing floors and woodwork.

National Lead Co., 111 Broadway, New York City.
124. Handy Book on Painting. Book 5½x3¼ in. 100 pp. Gives directions and formulas for painting various surfaces of wood, plaster, metal, etc., both interior and exterior.

Eugene E. Nice & Company, 268 South Second Street, Philadelphia, Pa.
125. *Price List "CO1"* contains descriptions of various paints, japans, varnishes, glue, stains, varnish remover, etc. 48 pp. Pocket size. Sent to any address.

Truscon Laboratories, The, Cor. Caniff Avenue and Grand Trunk R. R., Detroit, Mich.
131. *Spread the Sunshine Inside.* Booklet. 5 x 8 in. 24 pp. Describes methods for light saving by the application of light reflecting enamels to interior walls of factories.

PARTITION STEEL

Empire Steel Partition Co., College Point, Long Island, N. Y.

PARTITION SYSTEM

United States Gypsum Company, 205 W. Monroe St., Chicago, Ill.
133. *Loose leaf bulletins,* 8½ x 11 in. Jester-Sackett, consists of plaster board applied to metal channels with special clip, ready for plastering.

PARTITION TILE

United States Gypsum Company, 205 W. Monroe St., Chicago, Ill.
134. *Fireproof.* 32-page booklet, 8½ x 11 in., including description, specifications, and working details of Pyrobar partition tile.

PLASTER—(Interior)

United States Gypsum Company, 205 W. Monroe St., Chicago, Ill.

PLASTER BOARD

United States Gypsum Company, 205 W. Monroe St., Chicago, Ill.
135. *Pamphlets,* describes Sackett Plaster Board used instead of wood or metal lath.

PERGOLAS

Hartmann-Sanders Co., Elston and Webster Avenues, Chicago, Ill.
235. *Album No. 33.* 7½x10½ in. 42 pages of illustrated literature regarding the various types of Pergolas.

PLASTER, INTERIOR

National Kellastone Co., 155 East Superior Street, Chicago, Ill.

PLUMBING SUPPLIES

Hardin-Lavin Co., 4538 Cottage Grove Avenue, Chicago, Ill.
Hess Warming & Ventilating Co., 1205D Tacoma Building, Chicago, Ill.
136. *Hess Sanitary Steel Medicine Cabinets.* Booklet. 4 x 6 in. 16 pp. Illustrated.

B. Karol & Sons Co. 806 So. Kedzie Avenue, Chicago, Ill.

PUMPS

C. H. & E. Mfg. Co., Milwaukee, Wis.
251. Bulletin No. 2. Pumps.

The F. E. Myers & Bro. Co., Ashland, Ohio.
137. *General Catalog.* 6 x 9 in. 392 pages. Shows complete line of Myers Products—Pumps for Every Purpose, Hay Tools, Door Hangers, Store Ladders, etc. Of particular interest to hardware and implement dealers; plumbers, architects, contractors and builders; mill, mine, factory and railway superintendents and purchasing agents; highway contractors and builders.
138. *Catalogs.* 6 x 9 in. Devoted to separate lines: No. 55, Pump—Hand and Power Pumps; No. PP-55, Power Pumps; No. HT-55, Hay Tools, Door Hangers and Store Ladders; No. HP-22, Hydro-Pneumatic Pumps, Electric House Pumps, Direct Water Systems; No. SOP-21, Self-Oiling Power Pumps; No. MC-21, Cylinders and Working Barrels; No. SP-22, Spray Pumps and Spraying Accessories. All catalogs fully illustrated.

REFRIGERATION

McCray Refrigerator Co., 2264 Lake Street, Kendallville, Ind.

ROOF DECKS

United States Gypsum Company, 205 W. Monroe St., Chicago, Ill.
139. *Loose leaf bulletins.* 8½ x 11. Describing Pyrobar Roof Tile, which is laid directly on purlins or tee irons, joints grouted, and is then ready for roof covering.

ROOFING MATERIALS

Amalgamated Roofing Co., 431 So. Dearborn Street, Chicago, Ill.
American Sheet & Tin Plate Company, Pittsburgh, Pa.
140. *"Better Buildings."* Catalog. 8½ x 11. 32 pp. Describing Corrugated and Formed Sheet Steel Roofing and Siding Products—Black, Painted and Galvanized; together with directions for application of various patterns of Sheet Steel Roofing in various types of construction.
112. *Copper—Its Effect Upon Steel for Roofing Tin.* Catalog 8½ x 11 in. 28 pp. Illustrated. Describes the merits of high grade roofing tin plates and the advantages of the copper-steel alloy.

Asbestos Shingle, Slate & Sheathing Co., Ambler, Pa.
141. *Specifications and Price List.* Descriptive booklet. Details of Ambler Asbestos Cement Roofing Slates, "Century" Asbestos Shingles and Asbestos Corrugated Sheathings. Tables and drawings. Size 6 x 9 in. 44 pp.
142. *Ambler Asbestos Corrugated Roofing.* Catalog gives complete data for specifying, drawings, methods of application, tables, etc. Size 8½ x 11 in. 20 pp.

Wm. L. Barrell Co., of N. Y., Inc., 50 Leonard Street, New York.
143. *Prepared Canvas for Roofing.* Samples can be obtained on application. A canvas for every use.

John Boyle & Co., Inc., 112-114 Duane Street, New York, N. Y.
145. *Boyle's Bayonne Roof and Deck Cloth.* List B 93. A prepared roofing canvas guaranteed waterproof for decks and the roofs and floors of piazzas, sun-parlors, sleeping porches, etc.

Copper & Brass Research Association, 25 Broadway, New York City.

Cortright Metal Roofing Co., Philadelphia, Pa.
236. Four-page circular describing the various shingles.

Creo-Dipt Company, 1025 Oliver Street, North Tonawanda, N. Y.
153. *Standard Stained Shingle.* Samples of different kinds mailed on request.

"I purchased one of your movable stairways and have had it in use for several months. I could not get along without it."
C. L. Alcott, Cleveland, Ohio.

Added $500 to the Value of This Bungalow—

The owner wanted to use the upper story but could not afford the space the ordinary stairway required. He happened to mention this to a friend.

This friend had seen one of the Bessler Movable Stairways in another house and told this man about it. He investigated and the photograph shows the result. Another room was practically added to this house without using a single square foot of floor space in the room below.

Our catalog illustrates the various uses of the Bessler and also gives sizes, directions for installation, etc. Write for a copy

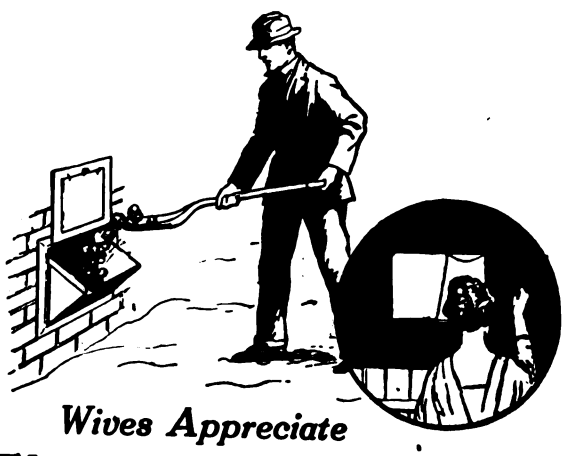
Roof stained with Cabot's Creosote Stains. Walls finished with Old Virginia White. Lined with Cabot's Quilt for warmth
Prentice Sanger, Architect, New York

For Roofs, Siding, Timbers and all Other Outside Woodwork

Cabot's Creosote Stains



They have *proved* their merit in every climate for nearly forty years. The colors are soft, rich and harmonious, the Creosote penetrates the wood, preserves it, and makes it less inflammable. Shingles make the warmest and cheapest outside finish, and a shingled house stained with Cabot's Stains is the ideal, cozy American country home.

Cabot's Insulating Quilt

A scientific heat insulator and sound-deadener that makes houses warmer in winter and cooler in summer and deadens sounds in floors and partitions. Not a mere felt or paper, but a non-conducting mat that is about thirty times warmer than common papers.

You can get Cabot's Stains and Quilt all over the country. Send for samples and names of nearest agents.

The Achilles Heels of a Building—

Gutters, valleys and flashings are the vital spots in the roof of a building—for these are the places where trouble starts and expensive leaks occur, because these are the places where the roof proper is cut through to allow for chimneys, dormer windows and the like (requiring flashings), or where two roofs come together increasing the flow of water from rain or melting snow (valleys), and finally where all the rain and melting snow is carried to rain conductors (gutters)—

Protect them with

TARGET AND ARROW

Look for this Trade ➵ *Mark on every Sheet*

ROOFING TIN

(Prior to 1905 called Taylor's "Old Style")

and make these places the most lasting and weathertight of the roof—unless the entire roof is of Target and Arrow.

The "Achilles Heels of a Building" is a graphic chart showing the vital spots in a roof. It explains how Target and Arrow is made by an old Welsh process which gives it such wonderful lasting qualities and includes sample specifications and other useful data. *If you have not received your copy send for it today.*

N. & G. TAYLOR COMPANY

304 Chestnut Street, Philadelphia

Headquarters for good roofing tin since 1810.

One of Our Experts

David J. Davis (foreman of cold rolls). Born in Morristown, South Wales, in 1876. He started to learn cold rolling in Wales when eleven years old. Has been foreman for twenty-six years and with the Taylor's since 1909. One of his boys is working in the mill.

Two of Our Experts

Herman A. Nolte (left—night foreman of hot mill). Rolling mill worker since boyhood. Began work in this mill about thirty years ago.

Howard Brinkman (right—foreman of hot mill). Has worked in the mill since 1900. Two of his boys are working in the hot mill, one of them being a roller.

Re-roofing Time

Spring and early summer are "brighten-up" time for house owners—a time for painting, decorating and repairing, inside and out.

This season offers a big opportunity for re-roofing jobs as well as for new construction. Old, weather-beaten house-tops are unsightly—and too often leaky. They deserve the same attention that outer walls, porches and fences are getting at this time of the year.

It is natural for a householder to keep putting off attention to "that roof," because he often regards it as an expensive, troublesome job. It needn't be—as you know—when Flex-a-Tile is used; for Flex-a-Tile House Tops can be laid right over old shingling as well as over new sheathing. It's a short job, without the labor and expense of tearing off the old covering. And besides, the over-wood application gives double insulation against heat and cold.

RICHARDSON *Product*

You are providing an economical, attractive roof when you specify Flex-a-Tile Giant or Standard Shingles, or Flex-a-Tile Shingle Roll—all of which are especially well adapted to over-wood applications.

The base in all three products is the same—Richardson felt, standard since 1868 for roofing strength. This inner fabric, asphalt-saturated, is coated on *both* sides with natural asphalt, scientifically tempered for perfect water-proofing in Richardson's *own* refineries. Then a surface coat of green slate from Richardson's *own* quarries—for beauty. (Flex-a-Til e Shingles also come in red, if you pre fer.)

Get after the shabby roofs in your town—make them new with Flex-a-Tile. There is a wide variety to choose from. We'll gladly send descriptive literature that will show Mr. House Owner what Flex-a-Tile can do for his house-tops.

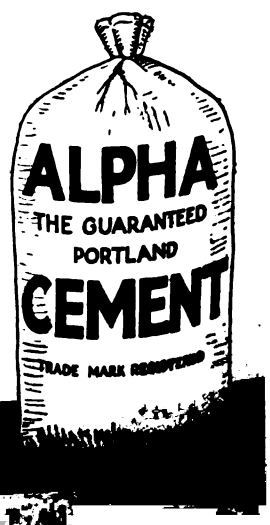
See the local ALPHA dealer



The Pennsylvania Railroad Terminal, New York City, is but one of the scores of everlasting monuments to cement construction into which ALPHA CEMENT entered. A million bags of ALPHA were used in this great structure.

Hourly tests by expert chemists at all ALPHA plants insure every cement-user the same uniformly high quality of product as that required in the largest buildings and bridges.

The 104-page illustrated handbook "ALPHA CEMENT—How to Use it," which may be procured from every ALPHA CEMENT dealer, tells something about ALPHA policies and manufacturing methods but is devoted mainly to practical information bearing on modern cement construction, particularly that relating to small structures.

KELLASTONE

IMPERISHABLE STUCCO

PLASTIC as clay in the hands of an artist, **Kellastone** yields itself readily to the free expression of the minutest architectural detail. Yet once applied, it turns to a stone-like material.

So genuinely artistic, so staunchly reliable, and so economical, it has enabled many a small building to raise its head proudly amongst those of more pretentious architecture.

KELLASTONE
IMPERISHABLE STUCCO

is the original, all-mineral, magnesite stucco, no cement, lime or gypsum in its composition. For cool comfort in summer, warmth in winter, and a weatherproof and firesafe building at all times, specify **Kellastone.** Write today for the **"Story of Kellastone".**

National Kellastone Company
ROOM 517
155 E. Superior Street
Chicago, Illinois

Look for the name *KELLASTONE* on every sack. It will insure you against the disappointing discovery that "all magnesite stucco is not *KELLASTONE*".

Contractors—

Buy from Your Local Building Material Dealer!

FIRST— Because your local building material dealer carries in stock the materials you need and can supply you **at once**—saving you time and money.

SECOND— Because he knows you—knows your reliability—and for that reason can extend credit to you.

THIRD— Because by buying through him you are saved the expenses of drayage, handling, etc.

FOURTH— Because your local building material dealer is a mighty good salesman for you. He is constantly combing the field, digging up new prospects, turning jobs over to you—in a word, developing profitable business for you that does not cost you a cent for selling expense.

FIFTH— Because his standing and rating in your community is recognized and therefore frequently becomes a factor in letting a job.

There are scores of other advantages to be gained by ordering through and working with your local building material dealer.

Manufacturers of Elastica, the only magnesite stucco known that is shipped "Complete in a Sack," sell to the Building Material Dealer Exclusively.

DEMOCRACIES AND MATERIALS

CENTURIES ago a little Greek city gave the world a democracy whose philosophy, literature, athletic records and architecture have lived ever since. The sculptors of that day took the finest marble from Pentellicus and Hymettus and in the shining stone made permanent record of Athens' achievements.

TODAY another democracy, our own nation, is making new records in the lines where Athens was supreme, and has added the world's greatest industries.

The permanence of the records of this new age are made possible only through the use of a new scientific basic material—Portland Cement. Giant educational, industrial, transportation, professional and athletic structures are built quickly and permanently with concrete. And the same material is equally desirable for the small job around the house or farm.

A quarter century has seen the growth of concrete's use. A quarter century has justified the increasing popularity of Atlas Portland Cement, "the Standard by which all other makes are measured."

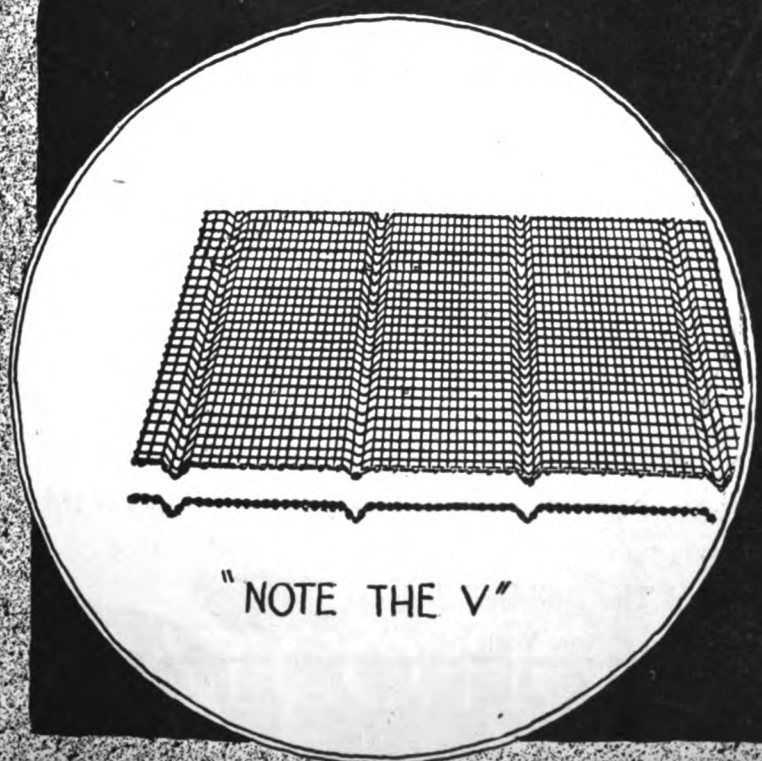
Grimm's Wire Lathing

This material has displaced the inconvenient and wasteful wood lath.



It requires no furring, is stapled right to the studding or sheathing and is unusually easy to handle.

Where the job demands stucco work, Grimm's Wire Lathing proves its efficiency and adaptability.

Extremely light, yet will last practically forever.

Write for special booklet, 61-F, which treats this modern lathing material in detail.

"Saved Chicago's West Side"

—Fire Marshal O'Connor

The Burlington Building, *fireproofed throughout with Natco Hollow Tile,* was the barrier that saved the entire west side of Chicago in the recent fire that destroyed so many millions of dollars of property, according to Thomas O'Connor, Fire Marshal of Chicago, and Architect Charles E. Fox of Marshall and Fox, who designed the building.

The heat to which it was subjected was so terrific that the glass in the windows ran like water—steel frames were contorted—steel filing cabinets, safes and shelves became warped and twisted and their contents destroyed—*but the steel skeleton of the building enclosed in Natco Hollow Tile was left intact and uninjured.* The Natco Hollow Tile Flat Arches used in the floor construction, as illustrated below, undoubtedly prevented any warping or sagging of the steel floor beams.

The results of this fire are conclusive proof of the merit of Natco Hollow Tile as a fire proofing and protective material for steel. The unprotected girders and rails of the elevated railway near the Burlington Building were bent like wire. Many of the girders fell to the street.

So slightly damaged was the building that according to Mr. Fox it can be completely rehabilitated in three weeks.

NATIONAL·FIRE·PROOFING·COMPANY

1431 FULTON BUILDING PITTSBURGH, PA.

From Chicago Tribune

TELLS WHAT FIRE ACTUALLY DID TO BIG SKYSCRAPER

Architect of Burlington Gives Facts.

The Burlington building unquestionably saved the entire west side from being destroyed.—Fire Marshal Thomas O'Connor.

BY AL CHASE.

"The fire was bad luck for the Burlington building, but certainly was good luck for Chicago," said Mr. Fox. "The Burlington has contributed the whole cost of saving the entire west side. If it hadn't been in the direct path of the fire nothing on earth could have stopped the flames from wiping out the whole west side."

Like a Huge Blow Torch.

"The Burlington road used the entire fifteen stories as well as basements and attic, with the exception of the bank on the first floor," continued Mr. Fox. "The building across the street acted as a huge blow torch and blew a blast of heat and gases into the six upper floors against which nothing could stand. Wire glass windows melted and draped themselves over radiators like handkerchiefs.

"The steel skeleton of the building, imbedded in concrete and covered with hollow tile, was not hurt, even in the path of the fiercest blast. Some of the tiles cracked off, but that was all. Floors were damaged slightly, in some offices not at all.

"We can have it ready for use in ten days," said Mr. Fox, "and the interior completely rehabilitated in three weeks."

COMPLETE TABLE OF CONTENTS

Discovering New Sources of Business

LESSON I

Confidence in Yourself
Fundamentals of the Contracting Business
Finding and Creating Business
Fires as a Source of Business
Capitalizing Social Life
Dividends from the Automobile Business
Finding Fill-in Work
Possibilities of Vacant Property
Developing Business Among Renters
Remodeling Dwelling House Interiors
Improvement of Dwelling House Exteriors
Grasping Opportunities You See
Using the Newspapers
Merchandising vs. Waiting

LESSON II

Securing New Clients

Finding Prospective Home Builders
Owners of Vacant Property
Savings Bank Deposits
Building and Loan Associations
Business and Professional Men
Selling Homes from Plans
Portfolio of Plans
Picking the Selling Points
Visualizing Your Work
Eliminate Trade Talk
Get the "Extras" in the Price
Emphasize the Unusual
The Prospect's Point of View
Simplify the Housekeeping
The Woman's Influence
Value of Refinements

LESSON III

Building Reputation

Backing Service with Reputation
Public Confidence in Your Integrity
Keeping Appointments
Fulfilling Promises
Prompt Action Makes Friends
Extras as Practical Advertising
Practical Suggestions
Conflicts with Other Contractors
Impressions Made by Employes
Accuracy in Time Charges
Disloyal Employes
Supervising Employes
Satisfied Clients

LESSON IV

Advertising

The Potential Value of Advertising
Some Advertising Don'ts
Foundation for Advertising
The Desire for Business
Facilities for Expansion
Standards Set by Advertising
Your Field of Possibilities
A Definite Plan
Newspaper Advertising
Mailing Lists
Your Advertising Appropriation

LESSON V

Accurate Estimating

Time Shedule
Incomplete Plans and Specifications
Visualizing the Building
Visit the Site
Effect of Season
Lists of Materials
Checking the Estimate
Value of Records of Cost
Table of Percentage of Cost
Sectionalizing the Estimate
Placing the Workmen
Pitfalls of Labor Estimate
Contingency Provisions
Proper Equipment

LESSON VI

Reading Architectural Plans for Estimating

Visualizing the Building
Perspective Drawings as Sales Helps
Quick Methods of Approximate Estimating
Advantage of Keeping Cost Data
Estimating from Working Drawings
Importance of the Specification
Symbols and Codes in Plans
What Is a Set of Plans?
Importance of Dimension Lines
How to Change a Blue Print
Interpretation of Plans
Constructive Criticism
Giving the Plans the "Once Over"
Loose Leaf System in Estimating
Eliminate the "Forgotten" Items

LESSON VII

Keeping Costs Within the Estimate

Eliminating the Gamble
"Rule of Thumb" Fallacies
Experience vs. Knowledge
Think
The Value of Personal Contact
Cost Keeping
Labor Hours Better Than Labor Cost
Watchfulness
Schedule Progress in Advance
Waste Is a Crime
Get What You Buy
Defeat the Weather
Factory Basis of Contracting
The Will to Do

LESSON VIII

Labor Saving Equipment

Higher Price Levels
Education of the Public
Lower Unit Costs
Lower Cost in Lumber Production
Motor Trucks and Trailers
Material Handling Equipment
Mixing Concrete
Job Made vs. Shop Made
Portable Machinery
Finishing Floors
Excavating
Painting
Office Helps
Shop and Yard
Preparing for the Future
Study the Catalogs
Filing Information
Labor Saving Machines

LESSON IX

Meeting the Labor Problem

Reducing Friction and Inefficiency
Organization Morale
Classification of Men
Seeking Men
Attracting Men
Stimulating Morale by the Unusual
Wage Not the Only Inducement
Avoid Trade Conflicts
Firmness and Justice
Trouble Makers
Your Labor Policy
Be Approachable
Social Unrest
Rewarding Merit
Select Foremen Carefully
Tolerance

LESSON X

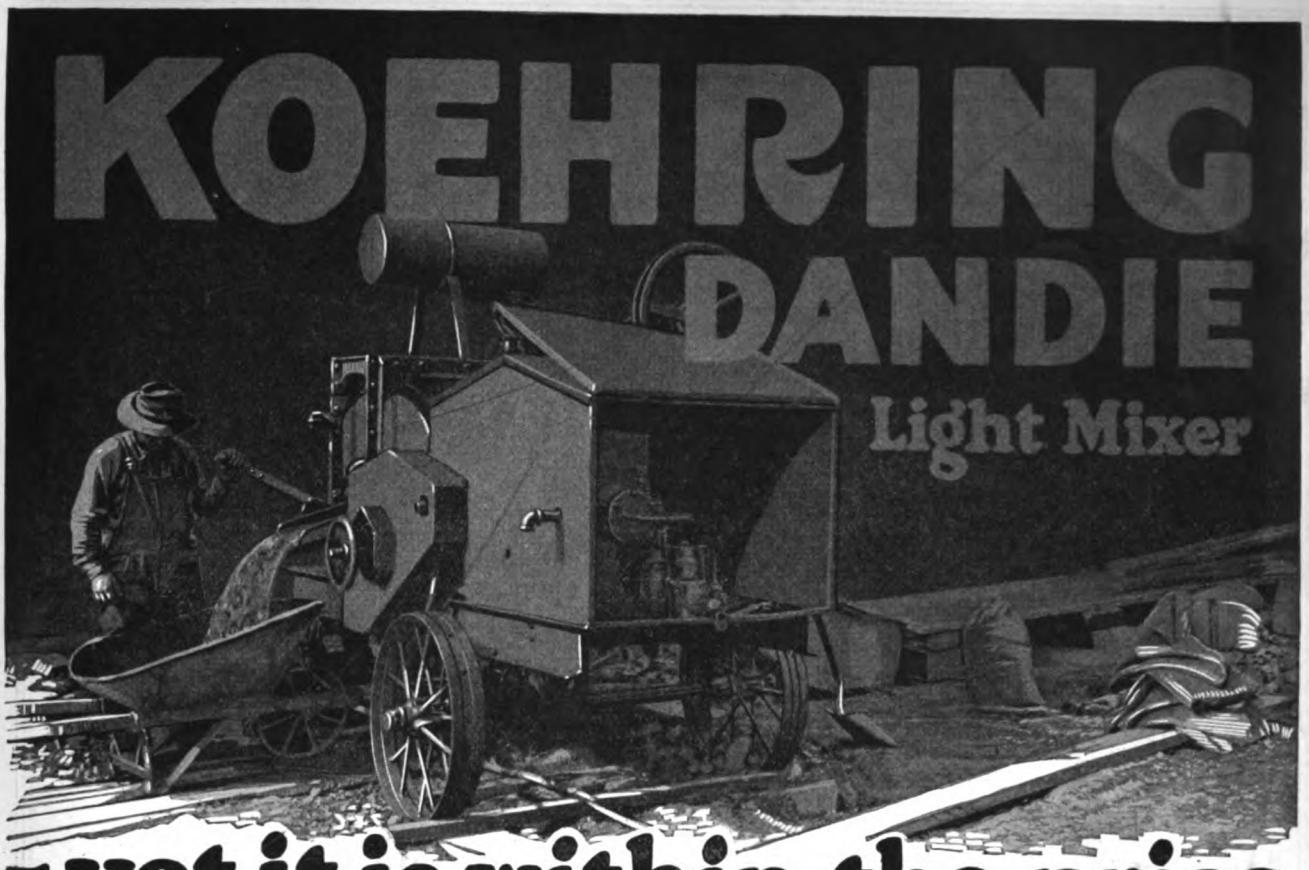
Kinks of the Law

Understand the Law
Common Pitfalls
Relations of Contractor to Others
Don'ts
Contractor and Owner
Difficulties with Sub-Contractors
Dealing with Material Men
Building Ordinances
Building Inspectors

LESSON XI

Making Prompt Collections

Collections Are Like Colds
Send a Letter
Explain the Reason
Offering Discounts
The Follow-Up
Exerting Pressure
Putting on the Screws
The Final Letter
They Will Pay



LESSON XII

Financing

Basis of Financing
Tangible Security
Personal Credit
Pitfalls of Credit
Business Records
Destroyers of Credit
Performing Obligations
Credit Building
Bankers Like Good Borrowers
Financing Building Operations for Clients
Safeguards at Present Price Levels
Effect of Collections on Financing
Value of Note Settlement
Financing Purchases

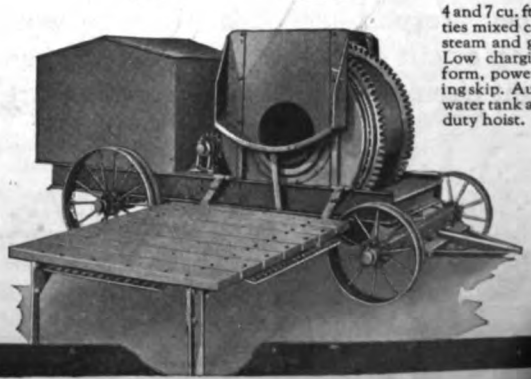
KOEHRING DANDIE Light Mixer

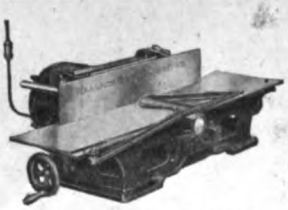
-yet it is within the price range for light mixers



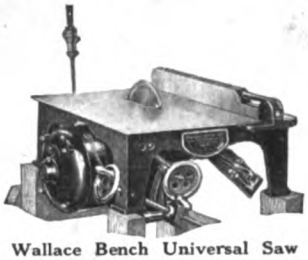
THE Dandie is a light, easily portable mixer for concrete footings, culverts, floors, and has also proved suitable for mortar mixing.

It is a Koehring mixer—Koehring designed and constructed—and this means that dependability and long service life are the first considerations, not lowest price. No it is not the lowest priced mixer, but is well within the price range for light mixers, making it the greatest ***value*** in light mixer field. It sets a new standard of efficiency and value for light mixers. Big production, standardization in every part, and automatic shop equipment keeps the price down!

Send Today for Catalog D 4



Get the details of construction—the liberal drum dimensions—double gear drum drive—the drum roller construction—universal bearings, mixing action—the two side discharge control—trouble-proof power—dust-proof housing. Get these details and you will see why the Dandie offers a remarkable value. Write for catalog D 4 today.



4 and 7 cu. ft. capacities mixed concrete, steam and gasoline. Low charging platform, power charging skip. Automatic water tank and light duty hoist.

Notice To Contractors

COLUMBIA FIRE HOUSE

The Board of Trustees of the Village of Mamaroneck, N. Y., hereby gives notice that they will open at their Meeting Room, Police Headquarters, East Boston Post Road, Mamaroneck, N. Y.,

APRIL 27, 1922
At 8 P. M.

sealed bids for the construction of a Fire House on Barry Avenue in said Village for the use of Columbia Hose Company.

Plans and specifications and information for bidders may be obtained by bidders upon application to Adrien Bedelle, Architect, 34 Highview Street, Mamaroneck, N. Y., upon depositing with the Architect the sum of TEN ($10.) DOLLARS which sum will be held until the return of the drawings and specifications.

(a) All bids are to be sealed with wax and are to be in the hands of the Architect by

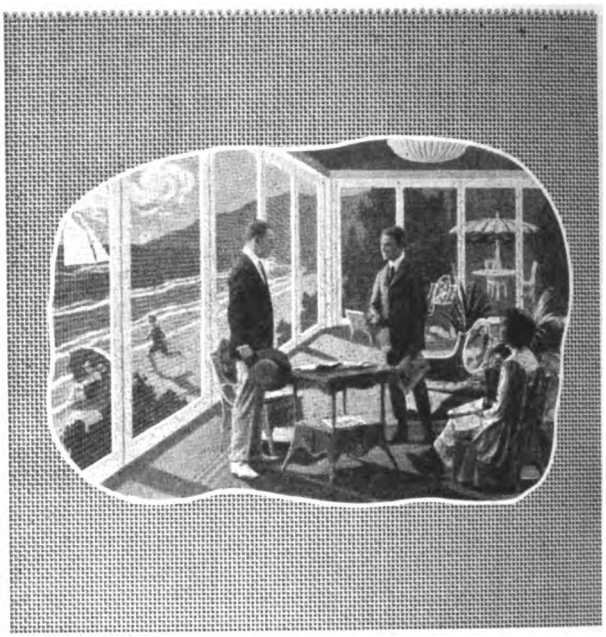
APRIL 25, 1922

(b) Bids will be received on twelve contracts as follows:

1. **Mason**
2. **Carpenter**
3. **Iron work**
4. **Steel joists**
5. **Steel sashes**
6. **Plumbing**
7. **Heating**
8. **Sheet metal**
9. **Electric**
10. **Electric fixtures**
11. **Tile**
12. **Painting**

OR the bidder is to have the choice of making a general bid for the entire work.

(c) Separate bids will be received on each contract.



(d) All bids to be in writing on forms furnished with plans and specifications and must be accompanied by a certified check on a solvent bank or trust company payable to the order of the Treasurer of the Village of Mamaroneck in the amount of fifteen per cent (15%) of the bid submitted. This check will be forfeited if successful bidder fails to duly enter into a contract.

(e) The successful bidder will be required to furnish a bond for the faithful performance of his contract in an amount equal to fifty per cent (50%) of the amount of his contract.

(f) Each bid must state explicitly upon what portion of the work it is based.

(g) The Board reserves the right to reject any or all bids, and reserves also the right to award in one contract or in separate contracts as above set forth.

Dated, Mamaroneck, N. Y.,
April 4, 1922.
JOHN F. HUNTER, M. D., President.
EDGAR L. HOWE, Clerk.

No Time to Lose!

PORTABLE Screen Panels, which lock together and close in the open sides of the porch, create a room which allows the enjoyment of both indoor and outdoor comforts, an out-of-door sleeping-room or a playground for the children — protected against disease carrying insects.

To assist you in pointing out to your prospect the simplicity of construction and installation of screened porches, we have prepared a Blue Print of a Porch Plan which we will send free for the asking.

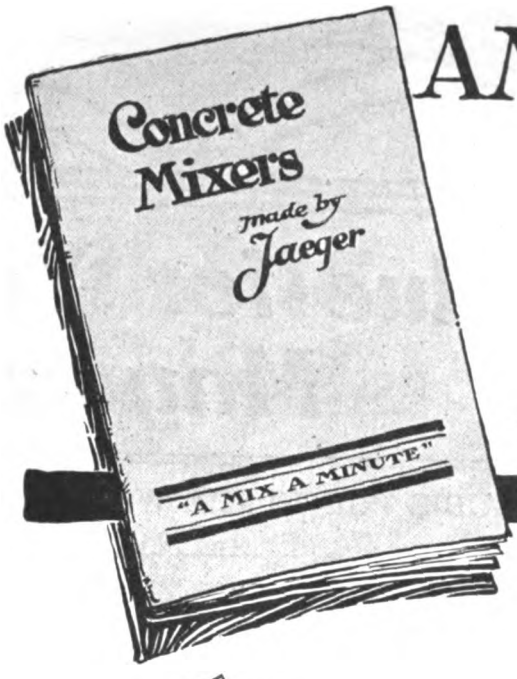
Now Is the Time to Make Them

Screened porches are money-makers for you. Due to its metallic coating, a special process exclusive with us, PEARL is longer lasting, hence most economical, besides being the most sanitary and beautiful.

Insure your workmanship and customer loyalty by specifying PEARL and make sure of getting the genuine by looking for our round red tag on each roll and the two copper wires in the selvage—our permanent mark of identification.

Call on your local dealer or write direct for samples and literature if you're interested in screen material.

Address Dept. "C"



The Gilbert & Bennett Mfg. Co.

New York Georgetown, Conn. Chicago Kansas City

PEARL is made in Regular Grade (12x13 mesh) and 14, 16, 18, 20, 24 and 30 mesh; also Extra Heavy Grade (14 mesh only)

The best hardware dealer in your city sells "PEARL"

A New JAEGER Catalog

Showing the Most Complete Line of Mixers Made ~ At New Low Prices!

Jaeger "A MIX A MINUTE"

The New Jaeger Catalog Is Off the Press

—and with the new book we announce *new low prices* on the complete Jaeger line. When you realize that Jaeger prices always have been extremely moderate, you will appreciate the unusual values presented at the new low prices.

There are four excellent reasons why the Jaeger line offers the most for the money in the mixer field:

The first cost is less.

The upkeep cost is less. Jaeger mixers are simple—sturdy—easy to operate.

They turn out as good concrete as any mixer made—*and do it in less time.*

The depreciation is from 20% to 30% lower than on any other line of mixers.

Our advertisements can only hit the high spots in the Jaeger story of mixer quality and low price. Our catalog gives you the facts complete. Whether you are thinking of buying a mixer just now or not, there's valuable information in this book for you—for every contractor, every builder, every user of concrete mixers.

Immediately on receipt of the coupon we will send you your copy of the Jaeger catalog. *Write today!*

WAR DEPA

Digitized by Google

in the War Department's June Sales

EVERY sales holds real investment VALUE for somebody. To take advantage of the opportunities offered by these sales there are several well defined steps you should follow. First—Write for catalogs of sales that interest you. Second—Make a study of the wide range of commodities listed. Select those items on which you will want to bid. Third—Send your own representative, or instruct someone to act for you.

You will see in the list of War Department Sales the location and dates of sales of the various materials. This outline will assist you in planning to take advantage of those sales most important to you.

For further information regarding all War Department Surplus Property Sales, write:

MAJOR J. L. FRINK
CHIEF, SALES PROMOTION SECTION,
OFFICE OF DIRECTOR OF SALES,
2515 MUNITIONS BUILDING WASHINGTON, D. C.

Future Sales in Project Include:

AIR SERVICE MATERIAL:

Curtiss Elmwood Depot, Buffalo, N. Y.; Long Island Engine Plant, N. Y.; Americus, Ga.; Richmond, Va.; Morrison, Va.; Montgomery Repair Plant, Ala.; Chapman Field, Fla.; Carlstrom Field, Fla.; Dorr Field, Fla.; Park Field, Tenn.; Selfridge Field, Mich.; Fairfield, Ohio; Love Field, Texas; Houston, Texas.

ORDNANCE MATERIAL:

Amatol Ordnance Reserve Depot, N. J.; Amatol Village, N. J.; Erie Howitzer Plant, Erie, Pa.; Picatinny Arsenal, N. J.; Aberdeen Proving Grounds, Maryland.

QUARTERMASTER SUPPLIES:

El Paso, Texas.

ARTMENT

Digitized by Google

The Kernerator consists of a brick incinerator, built into the base of the chimney when the house is erected, and a hopper door located in the flue on the first floor. It takes care of all household refuse—rags, sweepings, wilted flowers, broken crockery, tin cans and garbage. Non-combustibles are dried and sterilized and later dropped into the ashpit. It costs nothing to operate because no commercial fuel is required. The Kernerator should be specified in the plans before construction begins.

How the Kernerator Boosts the Builders' Business

Whether you build homes under contract or to sell, there's no better way to make friends who will recommend your houses than by including the Kernerator in your plans.

This modern system for disposing of household waste always finds favor with the women in the home because it saves so many steps. In addition to the comfort and convenience it provides, the Kernerator lowers the fire hazard by preventing the accumulation of inflammable refuse.

The Kernerator also promotes a new standard of neatness and sanitation throughout the home that has a strong appeal for the prospective home-owner.

Write for our interesting literature giving complete information regarding the Kernerator. Also see page 1906, *Sweet's* 1921 *Catalog.*

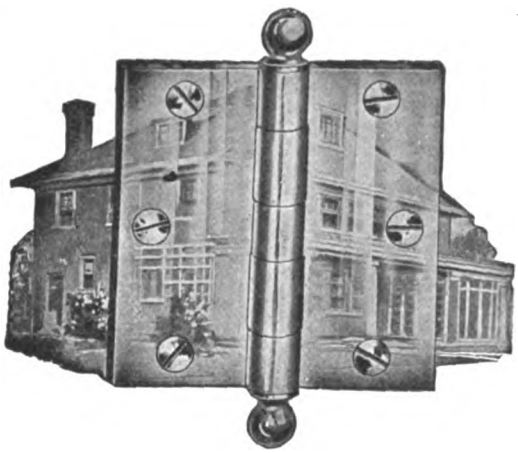
KNAPE & VOGT Garment Carriers

A Place for Everything and Everything in Place



ARCHITECTS and builders who do not know the Knape & Vogt Garment Care System are not giving their clients the benefit of the latest ideas in home convenience.

Although Knape & Vogt Garment Carriers may be easily installed in old fashioned closets, when planned for in new homes, they actually *save as much as* 15 *percent in construction costs.* Knape & Vogt closets are smaller, yet provide for more clothing, and keep it in *perfect order.* Installation is simple. Carriers made in lengths from 12 to 60 inches. Let us tell you how they operate.

Send for Full Details of Simple Installation.

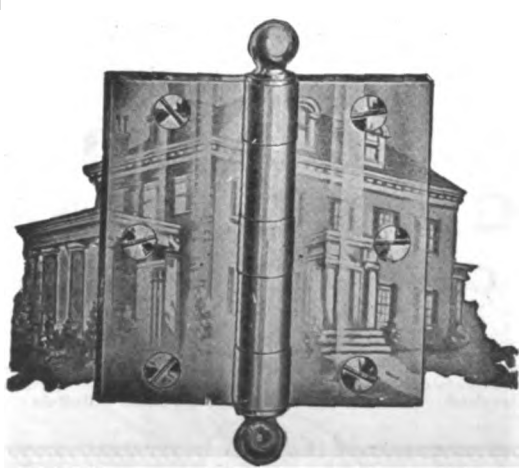
Your
ATTENTION!!

is called to the hinges on the door. To some people door hinges may seem rather small and unimportant—nevertheless, their mission in helping to make or mar the appearance of the rooms in a modern home is worthy of serious thought. The

GRIFFIN
"The Door Butt of America"

is designed along lines that insure both beauty to the home and *service* whenever the doors are opened and closed.



The Griffin operates freely and easily, it is amply strong for heavy doors and it is such a pleasing fixture that architects and home builders are glad to specify and use it.

Being finished in the various Griffin hardware finishes, it is in wide demand for the better class of houses and office buildings.

IT IS EASY TO SELL A KELSEY-HEATED HOUSE

A thoroughly reliable heating system goes a long way toward selling the house. In a prosperous town near New York, one builder has put up and sold over two hundred houses, with a Kelsey Warm Air Generator in every one of them. And **the heating system was a big factor in the sale.**

The Kelsey Warm Air Generator is totally unlike any other heater. It has been on the market for many years, has established a reputation for durability and economy, has the approval of the best architects in the country, and amongst owners is regarded as an ideal heating system.

The Kelsey Zigzag Tube

Its essential features are a constant supply of fresh warm air in large volumes at high velocity, resulting in an even distribution of heat; the automatic humidifier, supplying just the right amount of moisture for health and comfort; the removal of the stale air through vents at the floor line; and the scientific application of heating principles, which results in more heat to the ton than any other system.

Write for Booklet No. 5, giving further details.

Every yard of Herringbone bought is a yard on the walls. Only a ⅜ inch lap is ever necessary.

A Permanent Fire Stop

Meet the fire danger points in home construction with fire-preventing Herringbone.

Chimney breasts, flues, behind stoves—these are the points first attacked by fire. Herringbone with its keyed plaster overlay forms a permanent, rigid, fire confining wall. Aggressive builders everywhere now use Herringbone Rigid Metal Lath.

The increase in cost is but a small fraction of the increase in value.

Send for illustrated literature.

OAK FLOORS
(For Everlasting Economy)

Where Thousands of Feet Must Tread

By enlightening builders of public and semi-public buildings to the advantages and economies of fine Oak Floors, you perform a service to your clients which is more and more appreciated with the passage of time.

For after the building is in use your clients begin to realize the economies of this durable and easily cleaned flooring. And they learn, too, how it enhances selling and renting values.

Where resistance to wear and ease in cleaning are the important features, as well as where beauty and dignity are the chief considerations, Oak is the supreme flooring.

It is being used more and more every year in country clubs, dance floors, gymnasiums, armories, factories, offices, schools, churches, warehouses and other large buildings, where its stubborn resistance to the wear and tear of thousands of feet has demonstrated its ability to meet all tests.

You will find your clients eager to have Oak Floors, once they get the real figures on present prices, for laymen invariably overestimate the cost of Oak Floors.

SEE OUR CATALOGUE IN SWEET'S

For general specifications see Sweet's Architectural Catalogue, Page 458, 16th Edition; Page 389, 15th Edition.

Our three free booklets, in colors, contain much accurate and valuable information for the files of builder or contractor. Write for them today.

Level and Plumb With Your Own Instrument

$5.00

BRINGS IT TO YOU

Free Trial

Order the Aloe—try it for 10 days—put it to the most rigid tests. If you are not pleased, return it at our expense and your $5.00 will be refunded.

Above illustration shows instrument in Transit position. (Can be easily and quickly converted.)

FREE Write for this Book

Better, Quicker Work

This instrument will add immeasurably to your efficiency and put you in the big builder class—will do more to increase your business, income and prestige than any investment you ever made. The Aloe Convertible Level is the world's best—a combination of both level and transit and quickly converted to the use of either. Absolutely accurate—satisfies the requirements of the most exacting—yet so simple that anyone can use it.

Aloe Convertible Level and Transit Combined

You Learn to Use It In An Hour

No technical knowledge necessary. No previous experience needed. With our simple and complete instruction book, included free with every level, you can immediately put the instrument to work. It is a level and transit combined—takes sights either above or below the horizontal. You can use it for leveling foundations, walls, piers, streets, walks or curbings—to run straight lines for ditches or drains—boundary lines for fences or trees—surveying lots and fields—plumbing walls, shafts, trestles, posts and pillars.

Easy Monthly Payments

Just $5.00 brings it to you—for a free trial. If perfectly satisfied, pay the balance in small monthly payments. The instrument will be sent at once and from the first day it will be working for you—paying for itself by saving you the cost of borrowing an instrument or the fees you have been paying other men for this work.

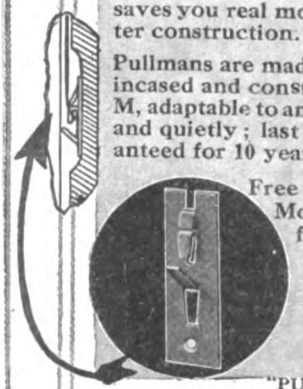
New Tape Hook
Makes
Pullman
Sash Balance



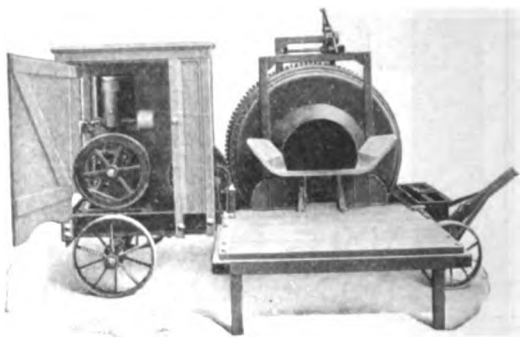
The 100% Window Device With No Increase in Price

The new Tape Hook makes it possible to fasten or unfasten the tape from the sash while sash is in place. No fussing with the stop; no mars or scratches; no refinishing; no lost time.

Pullman Sash Balances are easy to install and cost less than cords and weights. They are cheaper, not alone in first cost, but also because any carpenter can fit 2 to 4 windows with Pullmans while he would ordinarily fit one with cords and weights.

Pullmans eliminate box frames too. That alone saves you real money and makes a tighter, better construction.

Pullmans are made of pressed steel, are entirely incased and constructed in 3 UNITS, K, L and M, adaptable to any kind of sash. Operate easily and quietly; last indefinitely, in fact are guaranteed for 10 years.



Free illustrated catalog, full of Modern Window Operating Information, sent on request.

FORSTNER
Labor Saving
AUGER BIT

Bores Any Arc of a Circle

Many New Uses

The Forstner Auger Bit, unlike other bits, is guided by its circular rim instead of its center, consequently it will bore any arc of a circle, and can be guided in any direction regardless of grain or knots, leaving a true polished surface. Takes the place of a chisel, gouge, scroll-saw, or lathe tool combined. For core boxes, fine and delicate patterns, veneers, screen work, scalloping, fancy scroll twist columns, newels, ribbon molding and mortising.

Try it and be convinced.

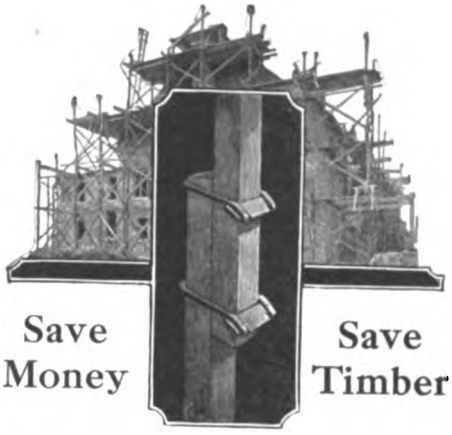
Digitized by Google

The Detroit Housing Organization secured these fine results on the home of Arther H. Otten, Highland Park, Mich. with 24-inch Silver Gray "CREO-DIPT" Stained Shingles on sides and 16-inch Light Green on Roof.

THE economy of "CREO-DIPT" Stained Shingles is due not only to the quality of material; to the best grade of vertical grained cedar; but also to the creosoting and preserving stain that penetrates the wood.

"CREO-DIPT" Stained Shingles are of selected grades, are vertically grained cedar, thoroughly dried. Shingles can not be successfully stained on the job because of uneven temperature conditions, unavoidable moisture in the wood, and uneven grading of vertical and flat grained shingles on the open market. Our process not only preserves shingles but saves the muss, waste, time, and labor of staining-on-the-job.



If you are going to build or remodel, write for Portfolio of Fifty Large Photographs of Homes by Leading Architects; Sample Colors on Wood. Ask about 24-in. "Dixie White" side walls; also about "CREO-DIPT" Thatch Roofs.

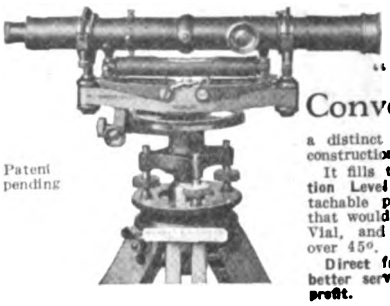
Send For Our Agency Proposition

It's Worth $5,000 a Year to Many of Our Agents
It's Worth That Much to You Too



The housing and building situation is more serious now than any time in history. This is the moment of opportunity for the man who wants to get into a business of his own, if ever, and in a field where he **makes real money.**
The weather strip business is an uncrowded field and there are places still where we would like to appoint live agents. Perhaps there's such an opportunity right in your locality.
Write us. You may be just the man whom we are looking for and this may be just the big opportunity that has been awaiting you.

Practically No Money Required

Unlike most businesses, the weather strip agent needs little money to swing it—practically none.
Everything is in favor for the active energetic man. So write for our cooperative selling plan. You do not obligate yourself in the least.

SEWAGE DISPOSAL

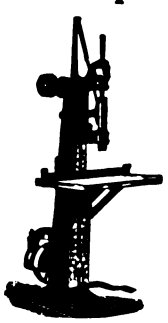
For Homes, Factories, Schools, Clubs, Hospitals, etc.

With the Aten System all the comforts of a modern city building are obtained, and free use can be made of toilets, sinks, bath tubs, wash stands, laundry tubs, etc.

It is the only system whose septic tanks are made of concrete reinforced wire-forms, not wooden forms—an advantage which should be understood. The septic tanks as well as the sub-soil drains are adapted to future extensions.

It is a system which can be installed by unskilled labor without the need of engineering service or experienced supervision in the field.

Is adapted to single buildings or groups.



Our many years' experience enables us to give valuable service to Architects and Builders without obligation.

Send for our illustrated catalog No. 10 which tells all about it.

Aten Sewage Disposal Co.
288 Fifth Ave., New York City

Improved Boring Machine

This machine is from new design, and no pains have been spared to make it a first-class machine in every respect. The spindle is made of crucible steel, has No. 2 Morse taper hole to receive shank, and the bearings are of genuine babbitt metal. It has two stops to regulate the travel of the spindle, one in the head to adjust the downward stroke and one in the treadle for the upward stroke. Greatest length of travel of spindle is 6½ inches. Distance from center of spindle to column, 10". Table is 26" x 36". It is balanced and has a vertical movement of 21". Spindle is balanced by a coil spring attached to arm on top of frame, making it self-contained. The bracket that carries the driving pulleys has an adjustment of two inches, which is very desirable. T & L pulleys are 8" x 3" face, and should make about 800 revolutions per minute. If belt gets loose, loosen screws in front of bracket and by turning set screw on top till your belt is of the right tension.

BE A FLOOR SURFACING CONTRACTOR

MAKE $5,000 to $15,000 OR MORE—YEARLY

New, uncrowded field. Architects and general contractors know the American Universal and prefer its work. They prefer to sublet the floor surfacing contract, as it is a big business in itself. Business comes easily the American Universal Way. We furnish office forms, advertising, etc.—in fact we practically set a man up in a business of his own.

SPRING BUILDING BOOM IS HERE

Building is starting all over the country. There are innumerable opportunities for those equipped to handle work of floor surfacing. The American Universal Machine is essential to hustlers. Get in on the ground floor—get the machine now. It will earn more than the original investment in this busy season.

Resurfacing Old Floors

Every building, large or small, is a prospect. Hundreds of floors right in your own vicinity need resurfacing. The owners will be glad to have you do it when you show them how easily and quickly the work can be done the American Universal Way. Old floors made like new—new floors made perfect.

Don't ever get caught out of work again—get into a big paying business of your own. Floor Surfacing Contractors pay for machines first month and make big profit besides.

WRITE TODAY for full information. Act NOW.
